If, however, isolated figures of this type do not supply an object for devotion or interest as being already complete and independent personality, their execution, carried out as it is in consonance with the principle of statuesque conception, has no meaning at all. Portraits, for example, are of

interest to relatives who know the man thus portrayed and his individuality. But where the personages thus depicted are forgotten or unknown the sympathy which is excited by their portraiture in a given action or situation, which gives definite content to a particular character, is of a wholly different kind to that which we find in the entirely simple type of conception above referred to. Really great portraits, when they face us in the fullest wealth of life all the means of art can display, possess in this wealth itself the power to stand forth from and step out of their frames. In looking at the portraits of Van Dyck, for example, more particularly when the pose of the figure is not wholly full face, but slightly turned away, the frame has struck me like the door of the world, which the man before me enters. When consequently individuals do not possess, as saints, angels and the like do, a characterization which is in itself sufficiently complete and acknowledged, and are only interesting by virtue of the definite character of a given situation, some single circumstance or particular action, it is not suitable to present them as independent figures. As an example of this the last work of Kügelchen in Dresden was a composition of four heads, half figures, namely, Christ, John the Evangelist, John the Baptist, and the Prodigal Son. So far as Christ and John the Evangelist are concerned I found the conception quite appropriate. But in the case of the Baptist, and in every respect in that of the Prodigal Son, I failed to connect with them the authentic character which could justify a treatment of them as half-length portraits. In such cases it is essential to place the figures in a condition of action or incident, or at least to show them in situations, by means of which, in vital association with external environment, they can assert the individuality which marks an essentially exclusive whole. The head of the Prodigal Son in the above picture expresses no doubt, very finely too, pain, profound repentance and remorse, but the only indication we have given us that this is the repentance of the Prodigal Son is a very diminutive herd of

swine in the foreground. Instead of a symbolical reference of this kind we ought to see him among his swine, or at least in some other scene of his life. The Prodigal Son, in short, does not possess for us any further general characterization complete as such in our minds and only exists, in so far as he is not purely allegorical, in the well-known scenes of Biblical narrative. He should be depicted to us as leaving his father's house, or in his misery, his repentance and return, that is, in the concrete facts of the tale. Those swine put in the foreground do not carry us much further than a label with "The Prodigal Son" written on it.

(*ββ*) And generally it is obvious that painting, for the reason that its function is to accept as its content the wealth of soul-life in all its detail, is, to a yet greater extent than sculpture, unable to rest satisfied with that repose on itself which is without defined situation and the conception of a character taken by itself and alone simply. It is bound to make the effort to exhibit such self-subsistency and its content in specific situation, variety, and distinction of character viewed in their mutual relations and in association with their environment. It is, in fact, just this departure from purely eclectic and traditional types, from the architectonic composition of figures and the statuesque mode of conception; it is just this liberation from all that is devoid of movement and action, this striving after a living human expression, a characteristic individuality; it is this investment of a content with all the detail of the ideal and external condition that affects it which constitutes the advance of the art, in virtue of which it secures its own unique point of view. Consequently to painting as to no other plastic art is it not merely permitted, but it is even required from it, that it should unfold dramatic realization, and by the composition of its figures display their activity in a distinctly emphasized situation.

(*γγ*) And, in the *third* place, closely connected with this absorption in the complete wealth of existing life and the dramatic movement of

circumstance and character, we are aware of the importance which is increasingly attached, both in conception and execution, to the individuality and the vital wealth of the colour aspect of all objects, in so far as in painting we attain to the supremest effects of vital truth which are capable of being expressed purely by colour.

This magical result of appearance can, however, be carried to such a pitch, that in contrast to it the exhibition of content becomes a matter of indifference, and painting tends to pass over, in the mere charm and perfume of its colour tones, and the contrast, fusion, and play of their harmonies, into the art of music, precisely as sculpture, in the elaboration of its reliefs, tends to associate itself with painting.

(*β*) What we have in the first instance now to pass in review are the particular lines[312] that pictorial *composition* is constrained to adhere to in its productions when presenting to us a definite situation and the more immediate motives referable to it by virtue of the way it concentrates and groups together various figures and natural objects in one self-exclusive whole.

(*αα*) What is of fundamental and pre-eminent importance here is the happy selection of a situation adapted to the art.

In this respect the imaginative powers of the painter possess an immeasurable field to select from, a field whose limits extend from the simplest situation[313] of an object insignificant in itself, such as a wreath of flowers, or a wineglass composed with plates, bread, and certain fruits, to rich compositions of important public events, political actions, coronation fêtes, battles, or even the Last Judgment, in which God the Father, Christ, his apostles, the heavenly legions, nay, our entire humanity, and earth, heaven, and hell are brought together. And here a closer inspection will show us that we must clearly distinguish what is truly pictorial on the one

hand from that which is sculpturesque, and on the other from what is poetical in the sense that it is only poetry that can fully express it.

The essential difference between a *pictorial*, and *sculpturesque* situation consists, as we have already seen, in this, that the main function of sculpture is to place before us that which is self-subsistent in its tranquillity, without conflict under conditions that do not affect it, in which distinctness of definition is not the main demand, it is only in the relief that it really begins to approach a group composition, and an epic expanse of figures begins to represent actions involving motion, and which imply collision of opposing forces. The art of painting, on the contrary, only thoroughly takes up its proper task, when it moves away from figures composed independently of their more concrete relations, moves away from a situation that is deficient in its elaboration, in order that it may thus pass into the sphere of living movement, human conditions, passions, conflicts, actions in persistent association with external environment, and even in its composition of natural landscape is able to retain firmly this definite structure of a given situation and its most lifelike individuality. It was for this reason that from the first we maintained that painting was called upon to effect the exposition of character, soul, and ideal qualities, not in the way that this spiritual world enables us to recognize it directly in its external shape, but in the way it evolves and expresses its actual substance by means of *actions.*

And the truth we have just mentioned is that which brings painting into closer relation with *poetry.* Both arts have in this respect an advantage[314], and from another point of view, also a disadvantage. Painting is unable to give us the development of a situation, event, or action, as poetry or music, that is to say, in a *series* of changes; it can only embody one moment of time. A simple reflection is deducible from this, namely, that we must in this one moment have placed before us the substance of the situation or action in its entirety, the very bloom of it; consequently, that moment should

be selected in which all that preceded and followed it is concentrated in one point. In the case of a battle, for example, this moment will be that of victory. The conflict is still apparent, but its decisive conclusion is equally so. The artist is able, therefore, to retain as it were the residue of the Past, which, in the very act of withdrawal and disappearance, still asserts itself in the Present, and furthermore can suggest what has yet to be evolved as the immediate result of a given situation. I cannot, however, here enlarge further on this head. The painter, however, together with this disadvantage as against the poet, is to this extent advantaged in that he can bring the precise scene before our vision in all the appearance of its reality, can depict it perfectly in all its detail. "*Ut pictura poesis erit*" is no doubt a favourite saying which is particularly and pertinaciously advanced by theorists, and is no doubt actually accepted and exemplified by narrative poetry in its descriptions of the seasons, its flowers, and its landscapes. Detailed transcription of such objects and situations is, however, not only a very dry and tedious affair, and indeed, so far from being exhaustive, always leaves something more to say. It is, further, contrasted with painting, only a confusing result, because it is forced to present as a successive series of ideas what painting sets before our vision once and for all, so that we constantly tend to forget what has gone before and lose it from our minds, despite the fact that it should be held in essential relation with that which follows, inasmuch as under the spatial condition it is in fact a part of it, and only is significant in this association and this immediacy. It is, however, just in this contemporaneous exposition of detail that the painter can restore that which, in respect to the progressive series of past and future events, he fails to secure.

There is, however, another respect in which painting yields place to poetry and music, and that is in its lyrical quality. The art of poetry can not only develop emotions and ideas generally as such respectively, but also in

their transitions, movement, and increased intensity. In respect to concentrated intensity this is yet more the case in music, which is essentially concerned with soul-movement. To represent this painting has nothing beyond the expression of face and pose; and if it does exclusively direct its effort, to what is actually lyrical, it misconceives the means at hand. However much the soul's passion may be expressed in the play of the countenance or bodily movement, such expression should not be directly referable to emotion as such, but to emotions in so far as they are present, with a *definite* mode of expression, in an event or action. The fact that it reveals ideality in external form therefore does not connote the abstract meaning that it makes the nature of the soul visible by means of physiognomy and form, under the mode of which it expresses soul-life; it is rather just the individual situation of an action, passion in some specific outburst thereof, by means of which the emotion is unfolded and recognized. When, therefore, it is attempted to interpret the poetical quality of painting under the assumption that it should express the soul's emotion directly, without a motive and action more near to it in facial expression and pose, all that we do in such a case is to throw the art back upon an abstraction, which its effort should precisely strive to be rid of; we ask of it, in short, that it should master the peculiar and just contribution of poetry; and if it attempts to do this the result will be a barren and stale one.

I particularly insist on this point because in the exhibition of art we had here last year (1828) several pictures from the so-called Düsseldorf school have received much attention, the painters of which, while displaying in their work considerable knowledge and technical ability, have laid almost exclusive stress on this ideal aspect, on material that is only capable of adequate presentment in poetry. The content, for the most part borrowed from poems of Goethe or from Shakespeare, Ariosto, and Tasso, may be generally indicated as the ideal emotion of Love. As a rule the most capable

of these pictures set before us a pair of lovers, Romeo and Juliet, for example, or Rinaldo and Armida, without any further situation, so that these couples have nothing more to do and express except the fact that they are in love with each other, in other words, they share a mutual attraction, gaze on each other as lovers, and as lovers look yet again. Naturally in such a case the main expression must be concentrated in the mouth and eyes; and we may add that our Rinaldo has been so placed relatively to his spider legs that he looks very much as though he did not know what to do with them. They are extensions which are entirely without meaning. Sculpture, as we have seen, dispenses with the glance of eye, the soul-flash; painting, on the other hand, seizes on this potent means of expression, but it must not focus everything at this one point, it should not make the fire or the refluent languor and yearning of the eye or soft friendliness of lips the soul and centre of expression without any other motives. Equally defective was the fisherman of Hübner, the theme of which was borrowed from that famous poem of Goethe, which depicts with such wonderful depth and charm of feeling the indefinite yearning for the repose, coolness and purity of water. The naked fisher lad, who in this picture is being drawn into the water, has, just as the male figures in the other pictures have, a very prosaic looking face, such as we could not imagine, if the features were in repose, to be capable of profound or beautiful emotions. And, as a rule, we cannot assert of these figures, whether male or female, that they are beautiful in a healthy sense; they, on the contrary, merely betray the nervous excitement, weakness, and disease of Love and emotional life generally, which people have no business to repeat and which we would willingly, whether in life or Art, be spared. To the same class of conception belongs the way that Schadow, the master of this school, has depicted Goethe's Mignon. The character of Mignon is wholly poetical. What makes her interesting is her Past, the severity of her destiny as it affects both her inward and outward

life, the conflict of her Italian, wholly excited passion in a soul which is still obscure to itself, which can neither decide upon a course of action or object, and which, being this mystery to itself, merges itself in such and yet can do itself no good. It is this self-expression wholly divided in itself and yet retiring into itself, and only letting us see its confusion in isolated and unrelated eruptions, which creates the awful interest we cannot fail to experience in her. Such a network of contradictions we may no doubt imagine in our minds, but the art of painting is wholly unable to, present it to us, as Schadow has attempted to do, simply by means of Mignon’s form and physiognomy, without defining further any situation or action. We may, therefore, assert generally that the above-mentioned pictures are conceived without any real insight for situations, motives, and expression. It is, in short, an inseparable condition of genuine artistic representations of painting that the entire subject-matter should be grasped with imaginative power, should be made visible to us in figurative form, which is expressed and manifests its ideal quality through a series of feeling, that is, through an action, which is of such significance to the emotion, that each and everything in the work of art appears to be entirely appropriated by the imagination to express the content selected. The old Italian painters have to a conspicuous degree, no less than their modern fraternity, depicted love-scenes, and in part borrowed the material from poetry; but they have known how to clothe the same with imagination and delight. Cupid and Psyche, Cupid and Venus, Pluto’s rape of Proserpine, the rape of the Sabine women, such and other similar subjects the old masters depicted in lifelike and definite situations, in scenes properly motived and not merely as simple emotion conceived without imaginative grasp, without action. They have also borrowed love scenes from the Old Testament. We may find an example in the Dresden Gallery, a picture of Giorgione, in which Jacob, after his long journey, greets Rachel, presses her hand and kisses her; in the

distance there stand a pair of youths by a spring, busily engaged in watering their herds, which are feeding, a large number of them, in the dale. Another picture presents to us Isaac and Rebecca. Rebecca gives Abraham's carls water to drink and is recognized in doing so. In the same way scenes are taken from Ariosto; we have Medor, for example, writing the name of Angelica on the edge of a spring. When, therefore, people nowadays refer to poetry in painting, this can only mean, as already insisted, that we must grasp a subject imaginatively and suffer emotions to unfold themselves in action; it excludes the idea of securing feeling simply as such or endeavouring thus to express it. Even poetry, which is capable of expressing emotion in its ideal or spiritual substance, is unfolded in ideas, images, and descriptions. If this art was content to abide by a mere "I love thee," repeated eternally, as its entire expression, such a consummation no doubt, might prove highly agreeable to those masters who have talked so much about the poetry of poetry, but it would be the blankest prose for all that. For art generally in its relation to emotion consists in the apprehension and enjoyment of the same by means of the imagination, which in poetry displays passion in its conceptions, and satisfies us in their expression, whether that expression be lyrical, or conveyed in epical events, or dramatic action. As a presentment of the inward life of soul, however, in painting the mouth, eye, and pose, do not alone suffice; we must have the total objective realization in its concreteness to make valid and vouch for such ideality.

The main thing, then, in a picture is that it present to us a situation, the scene of some action. And closely associated with this we have the primary law of *intelligibility.* In this respect religious subjects possess the supreme advantage, that they are universally known. The annunciation of the angel, the adoration of the shepherds or of the three kings, the repose in the flight to Egypt, the crucifixion, burial, resurrection, no less than the legends of the saints, were well known subjects with the public, for whom such pictures

were painted, albeit to our own generation the stories of the martyrs are removed to some distance. For a particular church, for example, it was mainly the biography of its patrons or its guardian saints which was represented. Consequently it was not always the painters themselves who selected such subjects; particular circumstances rendered such selection inevitable for particular altars, chapels, and cloisters, so that the place where they are exhibited in itself contributes to their elucidation. And this is, in part, necessary, for in painting we do not find speech, words, and names, by which interpretation of poetry may be materially assisted to say nothing of all its other means. And in the same way in a royal residence, council-hall, or parliament-building, scenes of great events, important situations taken from the history of the state, city, and building in which they are found are there, and receive a just recognition in the place for which they were originally painted. It is hardly likely, for instance, that in painting a picture for one of our palaces an artist would select a subject borrowed from English or Chinese history, or from the life of King Mithridates. It is otherwise in picture galleries, where we have all kinds of subjects brought together that we could wish to buy or possess as examples of fine works of art. In such a case, of course, the peculiar relation of any picture to a definite locale, no less than its intelligibility, so far as it is thereby promoted, disappears. The same thing is true of the private collection. The collector brings together just what he can get; the principle is that of a public gallery, and his love of art or caprice may extend in other directions.

Allegorical pictures are far inferior to those of historical content in the matter of intelligibility; they are, moreover, for the reason that the ideal vitality and emphatic characterization of the figures must in great measure pass out of them, indefinite, and not motive to enthusiasm. Landscapes and situations borrowed from the reality of daily life, are, on the contrary, no less clear in their substantial import than, in respect to their

characterization, dramatic variety, movement and wealth of existence, they supply a highly favourable opportunity for inventive power and executive ability.

(*ββ*) To render the defined situation of a picture intelligible, in so far as the artist is called upon to do this, the mere fact of its local place of exposition and a general knowledge of its subject will not suffice. As a general rule, these are purely external relations, under which the work as a work of art is less affected. The main point of real importance consists, on the contrary, in this that the artist be sufficiently endowed in artistic sense and general talent to bring into prominence and give form to the varied motives, which such a situation contains, with all the bounty of invention. Every action, in which the ideal world is manifested in that which is external, possesses immediate modes of expression, sensuous results and relations, which, in so far as they are actually the activities of spirit, betray and reflect its emotion, and consequently can be utilized with the greatest advantage as motives which contribute to the intelligibility of the work no less than its individual character. It is, for example, a frequent criticism of the Transfiguration picture of Raphael, that the composition is cut up into two unrelated parts; and this from an *objective* standpoint is the case. We have the transfiguration on the hill and the incident of the possessed child in the foreground. From an ideal[315] point of view, however, an association of supreme significance is undoubtedly present. For, on the one hand, the sensuous transfiguration of Christ is just this very exaltation of himself above the earth and his removal from his disciples, a removal which as such separation ought to be made visible; and from a further point of view the majesty of Christ is in this, an actual and particular case, to the highest degree emphasized by the fact that the disciples are unable to heal the possessed child without the assistance of their Master. In this instance, therefore, this twofold action is throughout motived, and the association is

enforced before our eyes, both in its external and ideal aspect, by the incident that a disciple expressly points to Christ who is removed from them, and in doing so suggests the profounder truth of the Son of God to be at the same time on Earth, in accordance with the truth of that saying, “If two are gathered together in my name I am in the midst of them.” I will give yet another illustration. Goethe on one occasion gave as a subject for a prize exhibition the representation of Achilles in female garments at the coming of Odysseus. In one drawing Achilles glances at the helmet of the armed hero, his heart fires up at the sight, and in consequence of this emotion the pearl necklace is broken which he wears round the neck. A lad seeks for and picks up the pieces from the ground. Such is an example of admirable motive.

Moreover, the artist finds he has to a more or less extent large spaces to fill in; he requires landscape as background, lighting, architectonic surrounding, and he has to introduce incidental figures and objects and so forth. All this material he should apply, in so far as it can be so adapted, as motives in the situation, and bring this external matter into unity with his subject in such a way that it is no longer insignificant. Two princes or patriarchs shake hands. If this is indicative of a peace treaty, and the seal upon the same, warriors, armed bands, and the like, preparations for a sacrifice to solemnize the pact, will be an obviously fitting environment. If such people happen to meet each other with a similar welcome on a journey, other motives will be necessary. To invent the same in a way that attaches real significance and individualization to the action, this it is which more than anything else will test the artistic insight of the painter so far as this aspect of his work is concerned. And in order to promote this not a few artists have also attached symbolical relations between background and the main action. In the composition, for example, of the Adoration of the three Kings, we not unfrequently find the holy Infant in His cradle beneath a

ruined roof, around Him the walls of a building falling in decay, and in the background the commencement of a cathedral. The falling stone-work and the rising cathedral directly suggest the victory of the Christian church over paganism[316]. In the same way we find, not unfrequently, in pictures, more especially of the Van Eyck school, which depict the greeting of the angel Gabriel to Mary, flowering lilies like stamens. They indicate the maidenhood of the mother of God.

(*γγ*) Inasmuch as in the *third* place the art of painting, by virtue of the principle of ideal and external variety, in which it is bound to give clear definition to situations, events, conflicts, and actions, is forced to deal on its way with many kinds of distinction and contradiction in its subject-matter, whether purely natural objects or human figures, and, moreover, receives the task to subdivide this composite content, and create of it one harmonious whole, a way of posing and *grouping* its figures artistically, becomes one of the most important and necessary claims made upon it. Among the crowd of particular rules and definitions, however, which are applicable to this subject, what we are able to affirm in its most general terms can only be valid in quite a formal way, and I will merely draw attention shortly to a few of the main points.

The earliest mode of composition still remains entirely architectonic, a homogeneous juxtaposition of figures or a regular opposition and symmetrical arrangement, not merely of the figures themselves, but also their posture and movements. We may add that at this stage the pyramidal form of grouping is much in favour. When the subject is the Crucifixion of our Lord such shapes follow as a matter of course. Christ is suspended on high from the cross, and at the sides we have a group of the disciples, Mary the mother, or saints. In pictures of the Madonna also, in which Mary is seated with her Child on a raised throne, and we find adoring apostles, martyrs, and so forth, beneath them on either side we have a further

illustration of this form. Even in the Sistine Madonna picture this mode of grouping is still in its fundamental features retained. And, generally, it brings repose to the eye because the pyramids, by virtue of its apex, makes the otherwise dispersed association coherent, giving an external point of unity to the group[317].

Within the limits, however, of such a generally abstract symmetrical composition, the pose of the figures may be marked in detail by great vividness and individuality, and equally the general expression and movement. The artist, while using in combination the means of his art, will have his several planes, whereby he is able more definitely to emphasize the more important figures as against the others; and he can in addition avail himself of his scheme of lighting and colour. The way he will arrange his groups to arrive at this result is sufficiently obvious. He will not, of course, place his main figures at the sides, or place subordinate ones in positions which are likely to attract the highest attention. And similarly he will throw the strongest light on objects which are part of the most significant content, rather than leave them in shadow, and emphasize with such strong light and the most conspicuous tints objects which are incidental.

In the case he adopts a method of grouping less symmetrical, and thereby more life-like, the artist will have to take especial pains not to make the figures press too closely on each other, which results in a confusion not unfrequently noticeable in certain pictures; we should not be under the necessity of having first to identify limbs and discover which belong to which, whether they be arms, legs, or other properties, such as drapery, armour, and so forth. It will, on the contrary, be wisest in the case of larger compositions, in the first instance no doubt, to separate the whole into component parts easily ascertained, but, at the same time, not to isolate them in dispersion entirely. And particularly will this be advisable where we have scenes and situations, which on their own account naturally tend to a

broad and disunited effect such as the gathering of manna in the wilderness, market-fairs, and similar subjects.

On the above subject I must restrict myself here to these very general observations.

(*γ*) Having thus, *firstly*, dealt with the general types of pictorial composition, and, *secondly*, with a composition from the point of view of selection of situations, arrangement of motives and grouping, we will now add a few remarks upon the mode of *characterization*, by means of which painting is to be distinguished from sculpture and its ideal plastic character.

(*αα*) I have several times previously taken occasion to remark, that in painting the ideal and external *particularity* of soul-life is admitted in its freedom, and consequently is not necessarily that typical beauty of individualization which is inseparable from the Ideal itself, but one which is suffered to expand in every direction of particular appearance, by virtue of which we obtain that which in modern parlance is called *characteristic.* Critics have generally referred to "the characteristic" thus understood as the distinctive mark of modern art in its contrast to the antique; and, in the significance we are here attaching to the term, no doubt the above contrast is just. According to our modern criterion Zeus, Apollo, Diana, and the rest are really not characters at all in this sense, although we cannot fail to admire their infinitely lofty, plastic, and ideal individualities. We already find a more articulate individualization is approached by the Homeric Achilles, the Agamemnon and Clytemnestra of Aeschylus[318], or the Odysseus, Antigone, and Ismene in the type of spiritual development which by word and deed Sophocles unfolds to us, a definition in which these figures subsist in what appears to be consonant with their substantive nature, so that we can no doubt discover the presentment of character in the antique if we are prepared to call such creations characters. Still in Agamemnon, Ajax, Odysseus, and the rest, the individualization remains

throughout of a generalized type, the character of a prince, of frantic rage, of cunning in its more abstract determinacy. The individual aspect is in the result closely intertwined with the general conception, and the character is merged in an individualization of ideal import. The art of painting, on the contrary, which does not restrain particularity within the limits of such ideality, is more than anything else occupied with developing the entire variety of that aspect of particularization which is accidental, so that what we have now set before us, instead of those plastic ideals of gods and men, is *particular people* viewed in all the varied appearance of their accidental qualities. Consequently perfection of corporeal form, and the fully realized consonancy of the spiritual or ideal aspect with its free and sane existence, in a word, all that in sculpture we referred to as ideal beauty, in the art of painting neither make the same claim upon us, nor generally are regarded as the matter of most importance, inasmuch as now it is the ideality of soul-life itself, and its manifestation as conscious life which forms the centre of interest. In this more ideal sphere that realm of Nature is not so profoundly insistent. Piety of heart, religion of soul can, no less than ethical sense, and activity in fact did in the Silenus face of Socrates, find a dwelling in a bodily form which, viewed on the outside simply, is ugly and distorted. No doubt in expressing spiritual beauty, the artist will avoid what is essentially ugly in external form, or will find a way to subdue and illumine it in the power of the soul which breaks through it, but he cannot for all that entirely dispense with ugliness[319]. For the content of painting, as we have above depicted it at length, includes within itself an aspect, for which it is precisely the abnormal and distorted traits of human figures and physiognomy, which are most able to express. This is no other than the sphere of what is bad and evil, which in religious subjects we find mainly represented by the common soldiers, who take a part in the passion of Christ, or by the sinners and devils in hell. Michelangelo was pre-eminent

in his delineation of devils. In his imaginative realization, though we find he passes beyond the scale of ordinary human life, yet at the same time an affinity with it is retained. However much notwithstanding the impersonations which painting sets before us necessarily disclose an essentially complete whole of characteristic realization, we will not go so far as to maintain that we cannot find in them an analogue of that which we refer to as the Ideal in the most plastic type of art[320]. In religious subjects, no doubt, the feature of all importance is that of pure Love. This is exceptionally so in the case of the Virgin mother, whose entire life reposes in this love; it is more or less the same thing with the women who accompany the Master, and with John, the disciple of Love. In the expression of this we may also find the sensuous beauty of forms associated, as is the case with Raphael's conceptions. Such a close affinity must not, however, assert itself merely as formal beauty, but must be spiritually made vital through the most intimate expression of soul-life, and thereby transfigured; and this spiritual penetration must make itself felt as the real object and content. The conception, too, of beauty, has its real opportunity in the stories of Christ's childhood and those of John the Baptist. In the case of the other historical persons, whether apostles, saints, disciples, or wise men of antiquity, this expression of an emphasized intensity of soul-life is rather simply an affair of particular critical situations, apart from which they are mainly placed before us as independent characters of the actual world of experience, endowed with force and endurance of courage, faith and action, so that what most determines the gist of their characters in all its variety is an earnest and worthy manliness. They are not ideals of gods, but entirely individualized human ideals; not simply men, as they ought to be, but human ideals[321], as they actually are in a certain place, to which neither particular definition of character is wanting, nor yet a real association between such particularity

and the universal type which completes them. Michelangelo, Raphael and Leonardo da Vinci, in his famous Last Supper, have supplied examples of this type, in the composition of which we find an entirely different quality of worth, majesty and nobility present than in those presented by other painters[322]. This is precisely the point at which painting meets on the same ground with the ancients, without, however, sacrificing the character of its own province.

(*ββ*) Inasmuch, moreover, as the art of painting, to the fullest extent among the plastic arts, acknowledges the claim of the specific form, and the individualized characterization to assert itself, so above all we find here the transition to real *portraiture.* We should be therefore wholly in the wrong if we condemned portrait painting as incompatible with the lofty aims of art. Who indeed could desire to lose the great number of excellent portraits painted by the great masters? Who is not, quite apart from the artistic merits of such works, curious to have definitely substantiated to their vision this actual counterfeit of the idea of famous personalities, their genius, and their exploits, which they may have otherwise had to accept from history. For even the greatest and most highly placed man was, or is, a veritable individual, and we desire to see in visible shape this individuality, and the spiritual impression of it in all its most actual and vital characteristics. But apart from objects, which lie outside the purview of art, we may assert in a real sense, that the advances in painting from its imperfect essays consist in nothing so much as this very elaboration of the *portrait.* It was, in the first instance, the pious and devotional sense which brought into prominence the ideal life of soul. A yet finer art added new life to this sense by adding to its product reality of expression and individual existence; and with this profounder penetration into external fact the inward life of spirit, the expression of which was its main object, was also enhanced and deepened. In order, however, that the portrait should be a genuine work of art the unity

of the spiritual individuality must, as I have already stated, be stamped upon it, and the spiritual impression of the characterization must be the one mainly emphasized and made prominent. Every feature of the countenance contributes to this result in a conspicuous degree, and the fine instinct for detecting such in the artist will declare itself by the way in which he makes visible the unique impression of any personality by seizing and emphasizing precisely those traits, and parts in which this distinctive personal quality is expressed in its clearest and most vitally pregnant embodiment. In this respect a portrait may be very true to Nature, executed with the greatest perseverance, and yet entirely devoid of life, while a mere sketch[323], a few outlines from the hand of a master, may be infinitely more vivacious and arresting in its truth. Such a study should, however, by indicating the lines or features of real significance, reflect that character in its structural completeness[324], if on the simplest scale, which the previous lifeless execution and insistence upon crude fact glosses over and renders invisible. The most advisable course, as a rule, is to maintain a happy mean between such studies, and purely natural imitation. The masterly portraits of Titian are of this type. The impression such make on us is that of a complete personality. We get from them an idea of spiritual vitality, such as actual experience is unable to supply. The effect is similar to that afforded by the description of great actions and events in the hands of a truly artistic historian. We obtain from such a much loftier and vitally true picture of the facts than any we could have taken from the direct evidence of our senses. Concrete reality is so overburdened with the phenomenal, that is incidental or accidental detail, that we frequently cannot see the forest for the trees, and often the most important fact slips by us as a thing of common or daily occurrence. It is the indwelling insight and genius of the writer which first adds the quality of greatness to events or actions, presenting them fully in a truly historical composition, which rejects what is purely external, and only

brings into prominence that through which that ideal substance is vitally unfolded. In this way, too, the painter should place before us the mind[325] and character of the impersonation by means of his art. If success is fully attained we may affirm that a portrait of this qualify is more to the mark, more like the personality thus conceived than the real man himself is. Albrecht Dürer has also executed portraits of this character. With a few technical means the traits are emphasized with such simplicity, definition, and dignity, that we wholly believe ourselves to be facing spiritual life itself. The longer we look at such a picture, the more profoundly we penetrate into it, the more it is revealed to us. It reminds one of a clear-cut drawing, instinct with genius, which completely gives expression to the characteristic, and for the rest is merely executive in its colour and outlines in so far as the same may make the characterization more intelligible, apparent, and finished as a whole, without entering into all the importunate detail of the facts of natural life. In the same way also Nature in her landscape paints every leaf, branch, and blade to the last shadow of a line or tint. Landscape painting, on the contrary, has no business to attempt such elaboration, but may only follow her subject to a principle of treatment, in which the expression of the whole is involved, which emphasizes detail, but nevertheless does not copy slavishly such particulars in all their threads, irregularities and so forth, assuming it is to remain essentially characteristic and individual work. In the human face the drawing of *Nature* is the framework of bone in its harsh lines, around which the softer ones are disposed and continue in various accidental details. Truly characteristic*portraiture*, however, despite all the importance we may rightly attach to these well defined lines, consists in other traits indicated with equal force, the countenance in short as *elaborated by the creative artist.*[326] In this sense we may say of the portrait that it not only can, but that it ought to flatter, inasmuch as it neglects what pertains to Nature's

contingency, and only accepts that which contributes to the characteristic content of the individual portrayed, his most unique and most intimate self. Nowadays we find it the fashion to give every kind of face just a ripple of a smile, to emphasize its amiability, a very questionable fashion indeed, and one hard to restrain within the limit imposed. Charming, no doubt; but the merely polite amiability of social intercourse is not a fundamental trait of any character, and becomes in the hands of many artists only too readily the most insipid kind of sweetness.

(*γγ*) However compatible with portraiture the course of painting may be in all its modes of production it should, however, make the particular features of the face, the specific forms, ways of posing, grouping, and schemes of colour consonant with the actual situation, in which it composes its figures and natural objects in order to express a content. For it is just this content in this particular situation which should be portrayed.

Out of the infinitely diversified detail which in this connection we might examine I will only touch upon one point of vital importance. It is this that the situation may either be on its own account a passing one, and the emotion expressed by it of a momentary character, so that one and the same individual could express many similar ones in addition and also feelings in contrast with it, or the situation and emotion strikes at the very heart of a character, which thereby discloses its entire and most intimate nature. Situations and emotions of this latter type are the truly momentous crises in characterization[327]. In the situations, for example, in which I have already referred to the Madonna, one finds nothing, however essentially complete the individualization of the Mother of God may be in its composition, which is not a real factor in the embracing compass of her soul and character. In this case, too, the characterization is such that it is *self*-evident that she does not exist apart from what she can express in this specific circumstance. Supreme masters consequently have painted the Madonna in

such immortal maternal situations or phases. Other masters have still retained in her character the expression of ordinary life otherwise experienced and actual. This expression may be very beautiful and life-like, but this form, the like features, and a similar expression would be equally applicable to other interests and relations of marriage lore. We are consequently inclined to regard a figure of this type from yet other points of view than that of a Madonna, whereas in the supremest works we are unable to make room for any other thoughts but that which the situation awakens in us. It is on this ground that I admire so strongly the Mary Magdalene of Correggio in Dresden, and it will for ever awake such admiration. We have here the repentant sinner, but we cannot fail to see that sinfulness is not here the point of serious consideration[328]; it is assumed she was essentially noble and could not have been capable of bad passions and actions. Her profound and intimately self-imposed restraint therefore can only be a return to that which she really is, what is no momentary situation, but her entire nature. Throughout this entire composition, whether we look at form, facial expression, dress, pose, or environment, the artist has therefore not in the slightest degree laid a stress on those circumstances, which might indicate sin and culpability; she has lost the consciousness of those times, and is entirely absorbed in her present condition, and this faith, this instinct, this absorption appears to be her real and complete character.

Such a complete reciprocity between soul-life and external surroundings, determinacy of character and situation, the masters of Italy have illustrated with exceptional beauty. In the example I have already referred to of Kügelchen's picture of the Prodigal Son, on the contrary, we have no doubt the remorse of repentance and grief expressed to the life; but the artist has failed to secure the unity of the entire character, which, apart from such an aspect of it, he possessed, and of the actual conditions under which such was depicted to us. If we examine quietly such features, we can only find in

them the physiognomy of any one we might chance to meet on the Dresden bridge or anywhere else. In the case of a real coalescence of character with the expression of a specific situation such a result would be impossible; just as, in true genre-painting, even where the concentration is upon the most fleeting moments of time, the realization is too vivid to leave room for the notion that the figures before us could ever be otherwise placed or could have received other traits or an altered type of expression.

These, then, are the main points we have to consider in respect to the content and the artistic treatment in the sensuous material of painting, the surface, that is, and colour.

3. HISTORICAL DEVELOPMENT OF PAINTING

In our consideration of this *third* section of our subject we are unable to confine ourselves, as we have hitherto done, to a wholly general examination of the content and purport appropriate to painting, and the mode of configuration, which follows from its principle, for in so far as this art is built up on the particularity of characters and their situation, and upon form and its pose, colour, and so forth, we are compelled to fix in our minds and discuss the *actual reality* of this art's separate productions. No study of painting is complete that does not take into its survey and is unable to enjoy and criticize the pictures themselves, in which the aspects of it we have examined are enforced. This is a general rule in the case of all art, but it applies with exceptional force to painting among those we have up to the present considered. In the case of architecture and sculpture, where the embrace of the content is more restricted, the means of exposition and configuration are to a less extent stamped with wealth and distinctive modification, and the particular aspects of their definition are simpler and more radical, we can more readily avail ourselves of copies, descriptions, and casts. It is essential in dealing with the art of painting that we should

see the actual works themselves. In this case mere descriptions, however important they may be in a subsidiary sense, will not suffice. In the infinite variety, however, of its explication, the various aspects of which are united in particular works of art, these works appear to us in the first instance as a mere motley array, which, by reason of the fact that our review of it is based upon no principle of classification, is only to a small extent able to disclose to us the unique quality of individual pictures. And it follows from this that galleries, as a rule, if we are not already able to connect with each picture our knowledge of the country, period, school, and master to which it belongs, is simply a collection without meaning, in which we lose ourselves. The most profitable arrangement for study and enjoyment with our eyes is therefore an exhibition based on *historical sequence.* A collection of this kind, co-ordinated in relation to such a principle, unique and invaluable of its class, we shall shortly be able to admire in the picture gallery of the royal museum in this city[329]. In this we shall not only possess a historical survey of the technique of art in its stages of development, but shall have set before our minds, as an essential process with a history, that articulation of its ideal content in the distinctions of its schools, their various subject-matter, and their different modes of artistic conception and treatment. It is only through having given us a survey as consonant as this is with that vital process that we can form an idea from its origins in traditional and eclectic types, of the living growth of art, its search after expression and individual characteristic, its liberation from the inactive and tranquil station of its figures, that we can appreciate its progress to dramatic movement, grouping, and all the wealth and witchery of its colour, or finally learn to distinguish its schools, which either to some extent treat similar subject-matter in a way peculiar to themselves, or are distinct from each other by reasons of the variety of their respective content.

A historical development of painting such as that referred to is of as great importance to *scientific* observation and exposition as it is to accurate study. The content of art as I have presented it, namely, the elaboration of its material, the distinct and fundamental changes in the mode of its conception, we find all this and more receives thus for the first time its concrete coherence in a sequence and under a classification which corresponds with the facts. It is therefore incumbent on us to glance at this process, if only by way of emphasis to what most immediately arrests attention.

In general the advance consists in this, that it originates in *religious* subjects conceived still in a *typical* way, with simple architectonic arrangement and unelaborated colour. After this, in an increasing degree of fusion with religious situations, we get actuality, vital beauty of form, individuality, depth of penetration, charm and witchery of colouring, until Art finally turns its attention to the world itself, makes itself master of Nature, the daily occurrence of ordinary life, or what is of significance in national history whether present or past, or portraiture and anything else down to the merest trifle and the least significant fact, and with an enthusiasm equal to that it devoted to the religious ideal, and pre-eminently in this sphere secures not merely the most consummate result of technical accomplishment, but also a treatment and execution which is most full of life and personality. This progress is followed in clearest outline if we take in succession the schools of Byzantine, Italian, Flemish, Dutch, and German painting, after noting the most prominent features of which briefly we shall finally indicate the transition to the art of music[330].

(*a*) In our review of Byzantine painting we may remark to start with that the practice of painting among the Greeks was to a definable degree always carried on; and examples of antique work contributed to the greater excellence of its results relatively to posture, draping, and other respects.

On the other hand the touch of Nature and life wholly vanished from this art; in facial types it adhered strictly to tradition; in its figures and modes of expression it was conventional and rigid; in its general composition more or less architectonic. We find no trace of natural environment and a landscape background. The modelling, by means of light and shadow, brilliance and obscurity, and their fusion, no less than perspective and the art of lifelike grouping, either were not elaborated at all, or to a very slight extent. By reason of this strict adherence to a single acknowledged type independent artistic production had little room for its exercise. The art of painting and mosaic frequently degenerated into a mere craft, and became thereby lifeless and devoid of spirit, albeit such craftsmen, equally with the workers on antique vases, possessed excellent examples of previous work, which they could imitate so far as pose and the folding of drapery was concerned. A similar type of painting spread its sombre influence over the ravaged West and more particularly in Italy. Here, however, although in the first instance with beginnings of little strength, we are even at an early date conscious of an effort to break away from inflexible forms and modes of expression, and to face, at first, however, in a rough and ready way, a development of loftier aim. Of Byzantine pictures we may, on the contrary, affirm, as Herr von Rumohr[331] has maintained of Greek Madonnas and images of Christ that "it is obvious even in the most favoured examples, their origin was that of the mosaic, and artistic elaboration was rejected from the first." In other words[332] the Italians endeavoured even before the period of their independent art development in painting, and in contrast to the Byzantines to approximate to a more spiritual conception of Christian subjects. The writer above-named draws attention also as noteworthy support of his contention to the manner in which the later Greeks and Italians respectively represented Christ on crucifixes. According to this writer "the Greeks, to whom the sight of terrible bodily suffering was of

common occurrence, conceived the Saviour suspended on the Cross with the entire weight of his body, the lower part of the body swollen and the slackened knees bent to the left, the bowed head contending with the pains of an awful death. Their subject was consequently in its essentials bodily suffering. The Italians, on the contrary, in their more ancient monuments, while we must not overlook the fact that the representation of the Virgin Mary with her Child no less than the Crucified is only of rare occurrence, were accustomed to depict the figure of the Saviour on the cross adopting, so it appears to us, the idea of the victory of the spiritual, not as in the former case the death of the body. And this unquestionably nobler conception asserts itself at an early date in the more favoured parts of Western Europe[333]." With this sketch I must here rest content.

(*b*) We have, however, *secondly*, another characteristic of art to consider in the earlier development of Italian painting. Apart from the religious content of the Old and New Testament and the biographies of martyrs and saints, it borrows its subjects in the main from Greek mythology, very seldom, that is, from the events of national history, or, if we except portraits, from the reality of contemporary life, and equally rarely, and only at a late stage and exceptionally, from natural landscape. Now that which it before all contributes to its conception and artistic elaboration of the subject-matter of religion is the *vital reality* of spiritual and corporeal existence, relatively to which at this stage all its forms are embodied and endowed with animation. For this vitality the essential principle on the spiritual side is that natural delightfulness, and on the corporeal side is that beauty which is consonant with physical form, a beauty which independently, as beautiful form, already displays innocence, buoyancy, maidenhood, natural grace of temperament, nobility, imagination, and a loving soul. If there is further added to a *naturel* of this type the exaltation and adornment of the soul in virtue of the ideal intimacy of religion and the spiritual characteristics of a

profounder piety established as a vitalizing principle of soul-life in this essentially more admitted and inviolable province of spiritual redemption[334], — in such a case we have presented to us thereby an original harmony of form and its expression, which, wherever it is perfected, vividly reminds us in this sphere of romantic art and Christian art of the pure Ideal of art. No doubt also within a new accord of this type the inward life of the heart will be predominant; but this inward experience is a more happy, a purer heaven of the soul, the way of return to which form what is sensuous and finite, and the return to God, albeit the passage may be through a travail in the profounder anguish of repentance and death, is, however, less saturated with trouble and its insistency. And the reason of this is that the pain is concentrated in the sphere of soul, of idea, of faith, without making a descent into the region of passionate desire, intractable savagery, obstinate self-seeking and sin, and only arriving at the hardly won victory through smiting down such enemies of the blessed state. It is rather a transition of ideal permanence[335], a pain of the inward life, which feels itself as such suffering rather simply in virtue of its enthusiasm, a suffering of more abstract type, more spiritually abundant, which has as little need to brush away bodily anguish as we have to seek signs in the characterization of its bodily presence and physiognomy of obstinacy, uncouthness, crookedness, or the traits of superficial and mean natures, in which an obstinate conflict is first necessary, before such are meet to express real religious feeling[336] and piety. This more benign[337] intimacy of soul, this more original consonancy of exterior forms to ideal experience of this kind is what creates the charming clarity and the untroubled delight, which the genuinely beautiful works of Italian painting excite and supply. Just as we say of instrumental music that there is tone and melody in it, so, too, we find that the pure song of soul floats here in melodious fusion over the entire configuration and all its forms. And as in the music of the Italians and in the

tones of their song, when the pure strains ring forth without a forced utterance, in every separate note and inflection of sound and melody, it is simply the delight of the voice itself which rings out; so, too, such an intimate personal enjoyment of the loving soul is the fundamental tone of their painting[338]. It is the same intimacy, clarity, and freedom which meet us again in the great Italian poets. To start with this artistic resonance of rhymes in their terzets, canzonets, sonnets, and stanzas, this accord, which is not merely satisfied to allay its thirst for reverberation in the one repetition, but repeats the echo three times and more, this is itself a euphony which streams forth on its own account and for the sake of its own enjoyment. And a like freedom is stamped upon the spiritual content. In Petrarch's sonnets, sestets, and canzonets it is not so much the actual possession of their subject, after which the heart yearns; it is not the consideration and emotion which are involved in the actual content of the poem as such, and which is therein necessarily expressed; rather it is the expression itself which constitutes the source of enjoyment. It is the self-delight of Love, which seeks its bliss in its own mourning, its laments, its descriptions, memories, and experience; a yearning, which is satisfied in itself as such, and with the image, the spirit of those it loves, is already in full possession of the soul, with which it longs to unite itself. Dante, too, when conducted by his master Virgil through hell and hell-fire, gazes at what is the culmination of horror, of awfulness; he is fearful, he often bursts into tears, but he strides on comforted and tranquil, without affright and anxiety, without the sullenness and embitterment which implies "these things should not be thus." Nay, even his damned in hell receive the blessedness of eternity. *Io eterno duro* is inscribed over the gates of hell. They are what they are, without repentance and longing; they do not speak of their sufferings; they are as immaterial to us as they are to them, for they endure for ever. Rather they are absorbed simply in their personal

experience and actions, secure of themselves as rooted in the same interests, without lamentation and without yearning[339].

When we have grasped this trait of happy independence and freedom of the soul in love we shall understand the character of the greatest Italian painters. It is in this freedom that they are masters of the detail of expression, and situation. On the wings of this tranquillity of soul they can maintain their sovereignty over form, beauty, and colour. In their most defined presentation of reality and character, while remaining wholly on the earth and often only producing portraits, or appearing to produce such, what we have are pictures of another sun, another spring. They are roses which are equally heavenly blossoms. And, consequently, we find that in their beauty we do not have merely beauty of form, we do not have only the sensuous unity of soul impressed on sensuous corporeal shapes; we are confronted with this very trait of reconciled Love in every mode, feature, and individuality of character. It is the butterfly, the Psyche[340], which in the sunlight of its heaven, even hovers round stunted flowers[341]. It is only by virtue of this rich, free, and rounded beauty that they are able to unfold the ideals of the antique art's more recent perfection.

Italian art has, however, not immediately and from the first attained to such a point of perfection; it had in truth a long road to traverse before it arrived there. And yet, despite this, the purity and innocence of its piety, the largeness of the entire conception, the unassuming beauty of form, this intimate revelation of soul[342], are frequently and above all in the case of the old Italian masters most conspicuous where the technical elaboration is still wholly incomplete. In the previous century it was fashionable to depreciate these earlier masters, and place them on one side as clumsy, dull, and barren[343]. It is only in more recent times that they have been once more rescued from oblivion by savants and artists; but the wonder and imitation thus awakened has run off into the excess of a preference which tends to deny the advances of a further development in mode of conception and presentment, and can only lead astray in the opposite direction.

In drawing the reader's more close attention to the more important phases in the development of Italian art up to this period of its fullest perfection, I will only briefly emphasize the following points which immediately concern the characterization of the essential aspects of painting and its modes of expression.

(α) After the earliest stage of rawness and barbarism the Italians moved forward with a fresh impetus from that in the main craftsmanship type of art which was planted by the Byzantines. The compass of subjects depicted was, however, not extensive, and the distinctive features of the type were austerity, solemnity, and religious loftiness. But even at this stage — I am quoting the conclusions of Herr von Rumohr — who is generally recognized as an authority upon these earlier periods[344], Duccio, the Sienese, and Cimabue, the Florentine, endeavoured to assimilate the few remains of antique drawing, which was grounded on laws of perspective and anatomical precision, and so far as possible, to rejuvenate the same in their own genius. They "instinctively recognized the value of such

drawings, but strove to soften the extreme insistence[345] of their ossification, comparing such insufficiently comprehended traits with the life such as we find it in fact or suggestion when face to face with their own productions[345]." Such are merely the first and mediating efforts of art to rise from the inflexibility of a type to lifelike and individual expression.

(*β*) The *further* step of advance consists in the complete severation from those previous Greek examples, in the full acceptance, relatively both to the entire conception and execution of what is distinctively human and individual, and along with this in the profounder suitability of human characters and forms which was gradually evolved to express the religious content thus to be expressed.

(*αα*) It is here before all we must draw attention to the great influence which Giotto and his pupils exercised. Giotto, along with the changes he effected in respect to modes of conception and composition, brought about a reform in the art of preparing colours. The later Greeks probably, such at least is the result of chemical analysis, made use of wax either as a medium of colour, or as a kind of varnish[346], and from this we get the yellow-green and obscure general tone, which is not sufficiently explained by the action of lamplight[347]. Giotto wholly dispensed with this glutinous medium of the Greek painters, and used instead, when preparing his colours[348], the clarified milk of young shoots, unripe figs, and other less oliginous limes[349], which Italian painters of the early Middle Ages had used, very likely even before they strenuously imitated the Byzantines[350]. A medium of this kind had no darkening effect on the colours, but left their luminosity and clarity unimpaired. Still more important was the reform effected by Giotto in Italian painting with respect to selection of subjects and their manner of presentment. Ghiberti himself praises Giotto for having abandoned the rude style of the Greeks, and without leaning in this direction to an excess having introduced the truth and grace of Nature. Boccaccio, too, says of him that

Nature is unable to create anything that Giotto could not imitate to the point of deception[351]. In Byzantine pictures we can hardly detect a trace of natural appearance. It was Giotto, then, who concentrated his attention on what is present and actual, and compared the forms and effects which he undertook to exhibit with Life as it existed around him. And we may associate with this tendency the fact that during the times of Giotto not only do we find that the state of society was more free and intent on enjoyment, but that the veneration of several later saints took its rise then, saints whose lives more or less fell in that period[352]. It was such Giotto utilized particularly in emphasizing the truthful presentment of the subjects of his art; there was, in fact, thus the further demand suggested by the content itself that he should bring into prominence the natural features of the bodily presence and exhibit more defined characterization, action, passion, situation, pose, and movement. What we find, however, to a relative degree disappears from this attempt is that imposing religious seriousness which is the fundamental characteristic of the phase of art which it followed[353]. The things of the world receive a stage and a wider opportunity for expression; and this is illustrated by the way Giotto, under the influence of his age, found room for burlesque along with so much that was pathetic. In this connection Herr von Rumohr states rightly, "Under conditions of this description I am at a loss to understand how certain critics, who have exclusively insisted on this feature of Giotto's work, can so overestimate Giotto's tendency and performance by claiming it as the most sublime effort of modern art[354]." It is a great service of the above-named critic to have once more placed in a true light the point of view from which Giotto can be justly appreciated; he throughout makes us careful to see, that in this tendency of Giotto to humanize and towards realism he never really, as a rule, advances beyond a comparatively subordinate stage in the process.

(*ββ*) The advance of painting continued under the manner of conception for which Giotto was in the main responsible. The typical representation of Christ, the apostles, and the more important events which are reported us by the evangelists, were more and more thrust into the background. Yet in another direction the embrace of subject-matter was for that reason extended. As our author expresses it: "All artists engaged in depicting the various phases in the life of latter-day saints, such as their previous worldliness, the sudden awakening of conscience, their entrance into the life of piety and asceticism, the miracles of their lives, more particularly after their decease, in the representation of which, as is to be expected from the external conditions of the art, the expression of the effect upon the living exceeded any suggestion of invisible powder[355]." Add to this that the events of the Life and Passion of Christ were not neglected. The birth and education of Christ, the Madonna with her Child were exceptionally favoured subjects, and were invested with a more life-like domesticity, touched with a more intimate tenderness, revealed to us in the medium of human feeling, and, moreover, to quote yet further: "In the problems[356] suggested by the Passion it was not so much the sublime and the triumph as simply the pathetic aspect which was emphasized, a direct consequence of the enthusiastic wave of sympathy with the earthly sufferings of the Saviour, to which Saint Francis, both by example and teaching, had communicated a vital energy hitherto unheard of."

In respect to a yet further advance towards the middle of the fifteenth century, we have to lay exceptional stress on two names, Masaccio and Fiesole. In the progressive steps through which the religious content was vividly carried into the living forms of the human figure and the animated expression of human traits Herr von Rumohr[357] draws attention to two essential aspects as of most importance. The one is the increase of rondure in all forms to which it applies; the other he indicates as "a profounder

penetration into the articulation, the consistency, the most varied phases of the charm and significance of the features of the human countenance." Masaccio and Angelico da Fiesole between them were the first to contribute effectively to the solution of this artistic problem, the difficulty of which in its entirety exceeded the powers of any one artist of that period. "Masaccio was mainly occupied with the problem of chiaroscuro, and the rounding and effective articulations of groups of figures. Angelico da Fiesole, on the other hand, devoted himself to sounding the depths of ideal coherence, that indwelling significance of human features, the mine of whose treasure he was the first to open to painting[358]." The effort of Masaccio was not so much one in the direction of grace as in that of imposing conception, manliness, and under the instinctive need for unity of the entire composition. The impulse of Fra Angelico was that of religious intensity, a love severed from the world, a cloistral purity of emotion, an exaltation and consecration of the soul. Vasari assures us in his account of him that he never commenced work without prayer, and never depicted the sufferings of the Redeemer without bursting into tears[359]. We have, then as aspects of this advance of painting a more exalted vitality and realism: but, on the other hand, the depth of piety, the ingenuous devotion of the soul in its faith overran itself and overpowered the freedom, dexterity, naturalism, and beauty of the composition, pose, drapery, and colour. If the later development was able to attain to a far more exalted and complete expression of the spiritual consciousness, yet the epoch we are now considering has never been surpassed in purity and innocence of religious feeling and serious depth of conception. Many pictures of this time may very well, by reason of the fact that the forms of life, which are used to depict the religious intensity of soul-life, do not appear fully adequate to this expression, give us something like a repulse; from the point of view, however, of spiritual emotion, which is the most vital source of these works

of art, we have still less reason to fail to acknowledge the naive purity, the intimacy with the most profound depths of the truly religious content, the assuredness of faithful love even under oppression and in grief, and oft, too, the charm of innocence and blessedness, inasmuch as the epochs that followed it, however much in other aspects of artistic perfection they made a step forwards, yet for all that never secured again the perfection of these previous excellencies, when once it had been lost.

(*γγ*) A *third* aspect attaches to the further development of the art, in addition to those already discussed, which may be described as the wider embrace of it relatively to the subjects accepted for presentation by the new impulse. Just as what was regarded as sacred had from the very commencement of Italian painting approached more closely to reality by reason of the fact that men whose lives fell about the time of the painters themselves were declared to be saints, so too Art received into its own sphere other aspects of reality and present life. Starting from that earliest phase of pure spirituality and piety, an art whose aim was wholly absorbed in the expression of such religious emotions, painting proceeded more and more to associate the external life of the world with its religious subject-matter. The gladsome, forceful self-reliance of the citizen in the midst of his professional career, the business and the craft that was bound up with such qualities, the freedom, the manly courage and patriotism, in one word, his weal in the vital activities of the Present, all this newly-awakened sense of human delight in the virtues of civil life and its cheer and humour[360], this harmonized sympathy with what was actual in both its aspects of ideal life[361] and the external framework of the same, all this it was which entered now into his artistic conceptions and modes of presenting such and was made valid therein. It is in this spirit that the enthusiasm for landscape backgrounds, views of cities, environment of church buildings and palaces becomes a real instinct of artistic life; the living portraits of famous savants,

friends, statesmen, artists, and other persons remarkable in their day for their wit and vivacity find a place in religious compositions; traits borrowed from both civil and domestic life are utilized with a greater or less degree of freedom and dexterity; and if, no doubt, the spiritual aspect of the religious content remained the foundation of all, yet the expression of piety was no longer exclusively isolate, but is linked together with the more ample life of reality and the open stage of the world[362]. No doubt we must add that by reason of this tendency the expression of religious concentration and its intimate piety is weakened, but art required also this worldly element in order to arrive at its culminating point.

(*γ*) Out of this fusion of the more embracing reality of life with the ideal material of religious emotion arose a new problem for genius to solve, the complete solution of which was reserved for the great masters of the sixteenth century. The supreme aim now was to bring the intimate life of soul, the seriousness and the loftiness of religious emotion into harmony with the animation, the actual presence of characters and forms both in its corporeal and spiritual aspect, in order that the bodily configuration in its pose, movement, and colour, may not simply remain an external framework, but become itself essentially an expression of spirit and life, and by virtue of that expression, made throughout all its parts wholly the reflex of soul-life no less than of external form, reveal a beauty without break or interruption.

Among the masters of most distinction, who set before themselves such an aim, we should pre-eminently mention Leonardo da Vinci. It was he, who, by virtue of his artistic thoroughness, his almost over-refined passion for detail, his exquisite delicacy of mind and feeling, not only penetrated further than any other[363] into the mysteries of the human form and the secrets of its expression, but, through his equally profound knowledge of all the technique of a painter, attained to an extraordinary infallibility in the

employment of all the means that his researches and practice had placed within his reach. And, along with this, he was able to retain a reverential seriousness in composing his religious subjects, so that his figures, however much they present to us the ideal of a more complete and rounded actuality, and disclose the expression of sweet, smiling joyfulness in facial traits and the delicate rhythm of drapery, do not thereby dispense with the dignity, which the worth and truth of religion demand[364].

The most unflecked quality[365] of perfection reached in this direction was, however, that first attained by Raphael. Herr von Rumohr assigns more particularly to the artists of the Umbrian School dating from the middle of the fifteenth century a mysterious fascination, which no sympathetic nature can resist, and endeavours to find the source of this attraction in the depth and tenderness of feeling no less than the marvellous unity into which these painters knew how to bring memories from the oldest essays of Christian art of a style only very partially understood by them[366] with the milder conceptions of a later time, and in this respect proved themselves superior to the Tuscan, Lombard, and Venetian fellow artists of that period[367]. It was just this expression of "flawless purity of soul and absolute surrender to the yearning and enthusiastic flow of tender feeling" to which Pietro Perugino, the master of Raphael, devoted his artistic efforts, and succeeded by doing so in fusing the objectivity and vitality of external forms, throughout all its actual realization and in every detail, an aim which had previously received the most marked attention in the elaborate work of the Florentines. Starting from the work of Perugino, to whose artistic taste and style he appears to have consistently adhered in his early work, Raphael proceeded yet further to realize to the most consummate degree the demand of the ideal above indicated. In other words we find united in him the highest ecclesiastical feeling for the themes of religious art and a complete knowledge and enthusiastic respect for natural phenomena in all the animation of their

colour and shape together with an insight fully as great for the beauty of the antique. This great admiration for the idealistic beauty of the ancients did not bring him in any way to imitate and adapt to his work the forms which Greek sculpture had elaborated in their perfection. What he seized from it was simply the general principle of their free beauty which in his hands was throughout suffused with a more individual vitality more applicable to his art and with a type of expression more deeply informed with soul-life, and at the same time with an open, blithesome clarity and thoroughness, in all the detail of the presentment that up to his time was as yet unknown among Italian artists. In the elaboration and consistent fusion and coherence of this ideal atmosphere he reached the highest point of his attainment. On the other hand, in the magical charm of chiaroscuro, in the exquisite tenderness and grace of soul-expression, of forms, movements, and grouping, it is Correggio who most excels, while the incomparable greatness of Titian consists in the wealth of natural life that he displays, the illuminating bloom, fervency, warmth, and power of his colour. We know nothing more delightful than the *naïveté* of Correggio's not so much natural as religious and spiritual grace, nothing more sweet than his smiling, unconscious beauty and innocence[368].

The artistic perfection of these great masters is a culminating point of art such as could only be mastered by one nation in the course of historical development.

(*c*) *Thirdly*, in so far as the question is that of German painting we may affiliate that which is entirely German with that of Flemish or Dutch painters. The general distinction between the above schools and that of the Italians, consists in this, that neither the Germans nor the painters of the Netherlands were willing as a creation of their own to attain to the free ideal forms and modes of expression characteristic of Italian art, or were able to

progress to that spiritually transfigured type of beauty which is essentially the result of such. What they did elaborate, however, was, in one aspect of it, the expression of depth of emotion and the austere seclusion of the individual soul, and, from another point of view, they attach to this intensity of faith the separate definition of individual character in the broader significance of it, that is to say, one which does not merely disclose the fact of its close interest with the claims of faith and salvation, but also shows how the individuals represented are affected by the concerns of the world, how they are buffeted by the cares of life, and in this severe ordeal have gained worldly wisdom, fidelity, consistency, straightforwardness, the constancy of chivalry and the sterling character of good citizens. Agreeably to this more restricted and depressed vision of the detail of life we find here, and it is particularly conspicuous in the German school, from the beginning, in deliberate contrast with the purer forms and characters of the Italians, rather the expression of a formal obstinacy of stubborn natures, which either oppose themselves to God with energetic defiance and brutal wilfulness, or are forced to impose restraint on themselves in order that they may, with sore travail, wrest themselves from their limitations and uncouthness, and fight their way to the reconciliation of religion; consequently the deep wounds which they inflict on their spiritual life inevitably contribute to the visible expression of their piety. In illustrating this more closely I will merely draw attention to certain prominent features, which are important indications of the contrast between the older Flemish school and the upper German and more recent Dutch masters of the seventeenth century.

(α) Among the early Flemish masters, the brothers Van Eyck, Hubert, and John are exceptionally distinguished in the early half of the fifteenth century, and it is only recently that their true merits have once more been established. It is now an established fact that they discovered, or at least they were the first to fully perfect, the process of oil-painting. Looking at

the great advance they made we must now assume that a distinct series of stages in the course of this progress to its culmination could be set forth. We have, however, no historical array of works of art preserved for us whereby we could illustrate such a gradual process. We are face to face at one moment of time with the beginning and final consummation. For painting of greater excellence than that of these two brothers it is almost impossible to imagine. Moreover, the works that have come down to us, in which the mere type is already dispensed with and overcome, not merely display a grand mastery in drawing, arrangement, grouping, ideal and exterior characterization, enthusiasm, clarity, harmony, and delicacy of colouring, dignity and repose of composition; but we must add that the entire wealth of painting respectively to nature's environment, architectonic accessories, backgrounds, splendour and variety of material, drapery, style of weapons, ornamentation, and much besides, is already treated with such fidelity, with such an instinctive sense of what is pictorial, and with such a technical virtuosity, that even later centuries, at any rate from the point of view of thoroughness and truth, have been unable to produce any more consummate result. We are, however, more strongly attracted by the master works of Italian painting, if we contrast them with this Flemish school, because the Italians, along with the completest expression of soul-life and the religious sense, retain throughout the ideal of spiritual freedom and imaginative beauty. The figures of Flemish art delight us, no doubt, by virtue of their innocence, *naïveté*, and piety; nay, in the depth of their emotional life they, in some measure, surpass the work of the most excellent Italian artists; but the Flemish masters have never been able to attain to a beauty of form and a freedom of soul comparable with that of the Italians. Their Christ-babes are, in particular, badly modelled; and for the rest their characters, whether men or women, however strongly, subject to their dominant expression of religious fervour, they may display a sterling character in their relation to

secular interests sanctified by the depth of their faith, nevertheless appear to us lacking in a significance which can exalt itself over such a piety, or rather, as dominated by it, do not appear able at the same time to be essentially free, instinct with imagination and the enterprise of superior qualities.

(*β*) A further aspect we shall do well to consider is the transition from the more tranquil, reverential piety to the representation of martyrdoms, and, in general, what is not beautiful in reality. It is more particularly the North German masters who excel in scenes borrowed from the Passion in which they emphasize the savagery of the soldiery, the evil aspects of the mocking, the fierceness of the hate against Christ during the course of His sufferings, with particular insistence on features of ugliness and distortion, and which are intended to denote external forms correspondent with the depravity of spirit. The tranquil and beautiful activity of an unassuming personal piety is thrown into the background, and the movements which are inseparable from the situations above mentioned unfold us hideous distortions, expressions of ferocity, and all the unbridled exhibition of passions. Where we have the contending tumult and the uncouthness of characters presented with such detail, it is not surprising that such pictures are defective in the ideal harmony of their composition no less than their colour, so that, more especially where a taste for old German paintings first crops up, critics when thus confronted with what is, as a rule, an inferior class of technical accomplishment, fall into many mistakes when determining the date of their production. Thus it has been maintained that they are previous to the more consummate pictures of the Van Eyck period, although, for the most part, they hail from a more recent time. However, the Upper German masters were not exclusively occupied with works of this type, but have likewise treated a variety of religious subjects, and, indeed — Albrecht Dürer, with others, exemplifies this — even in scenes from

Christ's Passion, have understood how effectively to grapple with the extremes of pure savagery, and even when treating such themes to preserve an ideal nobility and an external independence[369] and freedom.

(*γ*) Finally, the development of German and Flemish art is characterized in a complete identification of itself with the *ordinary* life of the Present; and, along with this, in a unified system of the most varied modes of presentation, which, both in respect to their content and technique, are distinct from one another and independently elaborated. We have seen already the advance made by Italian painting from the simple nobility of devotion to an ever-increasing assertion of secular motive, which here, however, as we pointed out in the case of Raphael, was in some measure permeated by ecclesiastical prepossessions, and in part limited by the coherent principle of antique beauty. We may add that the later course of this school is not so much a dissolution of that unity in the representation of every kind of subject-matter under the predominant interest of the colourist as a more superficial disposition, or rather, eclectic imitation of styles of draughtsmanship and painting. German and Flemish art, on the contrary, has in the most definite and exceptional degree traversed the entire scheme of content and modes of treatment, starting from its wholly traditional church pictures, single figures and half lengths, then on to thoughtful, pious, and devotional subjects, until we come to that animation and extension of the same in larger compositions and scenes, in which, however, the free characterization of figure, the heightened vitality effected by means of processions, retinues, incidental personages, embellishment of garments and utensils, wealth of portraiture, architectural works, environment, views of churches, cities, streams, forests, mountains, is still conceived and executed as a whole subject to religious motivation. This focal centre still persists; but we find that the range of subjects, which had hitherto been held together

in unity, is broken into division, and the separate parts become, in the specific singularity and contingent character of their alternations or independent modifications, subject to every possible type of conception and pictorial execution[370].

In order to arrive at a full appreciation of this aspect of art's development in the present context, for we have already referred to the point, we will pass briefly in review the national conditions which were operative in the change. We are under the necessity to justify, as we shall attempt to do in the following observations, a transition from direct relations to the Church and the outlook and pictorial modes of piety to a delight in the world simply, that is to say, to the objects and particular phenomena of Nature, to domestic life in its dignity, congeniality, and peaceful seclusion, to an enjoyment of national festivities and processions, rustic dances, the games and follies attendant upon church fêtes. Now the Reformation had thoroughly penetrated Holland. The Dutch had become Protestants and overcome the despotism of the Spanish Crown and Church. And what is more we do not, if we consider the political condition here, either find a distinguished nobility which drives forth its princes and tyrants, or imposes laws on them, nor yet an agricultural people, oppressed peasantry, who break free as the Swiss have done, but rather a population which, in by far the largest proportion of it, if we except the few brave souls that tilled the soil and its more than brave heroes of the sea, consisted of citizens of the town, men of business, well-to-do burghers, men who, rejoicing in their ordinary avocations, entertained no lofty pretensions, but, as became their courage and intelligence, with audacious reliance in God, stood up to defend the freedom of their hardly-won liberties and the particular privileges of their provinces, cities, and guilds, dared to oppose themselves to all hazards without fear of the transcendent prestige of the Spanish

dominion over half the world, to bravely let their blood flow for such an aim, and by virtue of this righteous boldness and endurance victoriously secured both their religious and civic independence. And if we may brand any single condition of soul-life as distinctively *deutsch*, it is just this loyal, well-to-do, and genial citizenship, which, in a self-respect that is without pride, in a piety which is not merely absorbed in enthusiasm and devotion, but which is concretely pious in the affairs of the world[371] and is homely and contented in its abundance, remains neat and clean, and in persistent carefulness and contentment under all circumstances, armed with its own enduring sense of independence and freedom, is able, with loyalty to its former life, to preserve the sterling character of its forefathers unimpaired. This intelligent and artistically endowed people furthermore seeks its enjoyment in the pictorial presentment of its vigorous, justly co-ordinated, satisfying, and comfortable existence; it is all for taking a renewed delight by means of its pictures in the cleanliness under all conditions of its towns, houses, and domestic arrangements, of enjoying thus its household felicity, its wealth, the generous adornment of its wives and children, the splendour of its civic feasts, the boldness of its seamen, the fame of its merchandise and the shipping, in which it rides over all the seas of the world. And it is just this instinct of orderly and cheerful existence, which the Dutch masters emphasize also in their landscape subjects. In one word, in all their pictorial accomplishment they succeed in combining with freedom, and truth of conception, with their enthusiasm for what is in appearance of inferior and momentary significance, with the freshness of open vision and the concentration of their entire soul on all that is most stamped with the seclusion and limitations of their life, the most ample freedom of artistic composition, no less than the finest feeling for accessories and the most perfect effects of studious elaboration. From one point of view this school of painting has developed to an incomparable degree the magic and mystery

of lighting and colour[372] generally in its scenes borrowed from war and military life, in its tavern jollifications, in its weddings and other rustic fêtes, in its pictures of domestic life, in its portraits, landscapes, animals, flowers, and the rest. From another aspect it has elaborated with a similar excellence the characterization which penetrates to the heart of life in all the truth of which Art is capable. And although its insistence on the insignificant and contingent includes the expression of what is boorish, rude, and common, yet these scenes are so permeated throughout with ingenuous lustiness and jollity, that it is not the common in its meanness and naughtiness so much as the gaiety and joviality which creates the artistic subject and its content. We do not look at mean feelings and passions, but simply what is boorish, in the sense of being rustic, near to nature, in the poorer classes, a quality which connotes geniality, waggishness, and comedy. In short the Ideal itself is not wholly absent from this unperturbed easy-way-of-life. It is the Sabbath of Life, which brings all to one level and removes all badness, simply as such. Men who are thus so whole-heartedly of good temper can neither be wholly bad nor mean. In this respect it is not one and the same thing, whether evil is of purely momentary appearance in a character, or lies at its root and essence. In the work of these Dutch painters what is humorous in a situation cancels what is evil, and it is at once clear to us that the characters could be something other than that in the guise of which they are for the time being set before us[373]. A gaiety and comedy of this description contributes much to the invaluable character of these pictures. If pictures of this rollicking type are attempted nowadays, the painter, as a rule, only places before us what is essentially mean, coarse and bad without the illuminating atmosphere of a comic situation[374]. A bad wife rails at her tipsy husband in the tavern with all her might. In a scene of this kind we have only put before us, as I have

already remarked, the bald facts that the man is a dissipated brute and the woman a rating wench.

If we look at the Dutch masters in this light we shall no longer entertain the view that the art of painting should have said good-bye to such subjects altogether, and merely confined itself to depicting the gods of old, myths, and fables, or even Madonna pictures, crucifixions, martyrs, popes, and saints of both sexes. What is a vital ingredient of every work of art is inseparable also from painting, and this is the observance of what generally concerns our humanity, the spirit and characterization of man, in other words what man is and what *each* individual is. This vital grasp of the conscious life of human nature and the external forms of its appearance, this naive delight and artistic freedom, this freshness and cheerfulness of imaginative sympathy, this absolute directness of execution is what constitutes the poetry that underlies the work of the majority of the Dutch painters of this period. In their paintings we may study and acquaint ourselves with human nature and mankind. Nowadays, however, our artist only too frequently will confront us with portraits and historical pictures, at which we have only to cast a bare glance, and we see that, while flatly contradicting the wildest dream of what is possible in mankind or anyone in particular, he neither knows aught at all about man or his natural colour, nor yet the modes of composition[375] in which we may justly express that humanity[376].

[214] *Die gesammte Menschen-brust.*

[215] *Die in sich gediegene Individualität des Gottes.*

[216] *Betrachtung*, here implying thought rather than vision.

[217] That is a unity which dissolves all difference.

[218] *Als Inneres.*

[219] *Als Reflexion in sich.* Probably Hegel means simply the ultimate fact of self-conscious life — which is to find itself in Nature as the antithesis of the synthetic unity of the ego. This is developed in the latter half of the sentence.

[220] Lit., “Is not an essentially persistent and stereotyped (*Erstarrtes*, stiffened) individual.”

[221] Less than sculpture.

[222] He may mean type of art generally, but I think the reference here is simply to painting. The passage is an important one.

[223] I presume Hegel uses the word *seeligkeit* in the ordinary sense, not “soulfulness.” The close relation with *Schmertz* necessitates this. But the spelling suggests the other interpretation.

[224] Which is absent in the classical treatment.

[225] That is, the creative artist.

[226] *Innerlichkeit.* It is impossible to express Hegel’s use of this word by one expression. It combines intimacy, ideal union, and inwardness of soul-life in its contrast to objective reality.

[227] That is the romantic type.

[228] *Die für sich seyende Subjektivität.* That is a process that elaborates itself in independent form consonant to its own substance.

[229] *Als dieses Subjekt.* That is, I assume, as the distinctive personality of the artist. This must appear on the face of the work as the crown of its independent type and concrete unity (*Zur Spitze des Fürsichseyns*) but must not dominate it to the extent of destroying all natural detail, not even to the extent of sculpture.

[230] *Zur Spitze des Fürsichseyns.* See note above.

[231] That is their union in sculpture.

[232] *Als solcher.* Hegel means that the universal present in emotion is objective therein as part of the self-conscious life, but is only presented in the concrete objective shape in the work of the artist who therein suffers to escape the wholly personal side.

[233] *Sein Inneres*, his ideal substance, with more direct reference to feeling.

[234] *Aus demselben in sich hineingehend.* I think what is meant is that the material is idealized out of one of its spatial conditions rather than that the artist selects his *medium* in consonance with his temperament and technique.

[235] That is, does not affect the stability and total effect of the work. Of course the actual effect may vary.

[236] *Für diesen festen Punkt des Subjekts.*

[237] *Die in sich besonderte Innerlichkeit.*

[238] The distinctions in matter conditioned in Space.

[239] The meaning, if rather obscurely expressed, appears to be this. The art of sculpture shows us when it treats the spatial dimensions as essential that we must have the entire spatial form to do this, and it shows us that if we wish to pass from the mere presentment of bodily form to a fuller ideal quality we must contract this exclusive appearance of physical matter.

[240] Lit., “Begins to be subjective.” Begins to possess a self-excluding centre of unity, *i.e.*, self-identity.

[241] That is to the point of a real subject or ego.

[242] *E.g.*, secure an abstract result in superficies only.

[243] Apart from artistic means.

[244] Though the statements here are suggestive, they are obviously influenced by Hegel’s belief in the false theory of light propounded by Goethe.

[245] This is a direct reference to the Newtonian theory, of course.

[246] *Zeichnung* here refers to line rather than technical excellence in draughtsmanship. It must be admitted Hegel's emphasis of these two aspects is carried rather too far.

[247] The above passage is open to criticism. Hegel hardly makes allowance for the fact that the defective technique, so far as it is defective, of the earlier masters, was mainly due to their state of knowledge. Art was, in a certain aspect of technique, in its infancy. Moreover to compare Dutch landscape with that of Bellini or Raphael is to compare things that are each unique of their kind and not comparable. Their aim was entirely different. In such pictures as the San Sisto Madonna of Raphael, the great Crucifixion of Tintoret, or the Entombment of Titian it is quite impossible to maintain that the earnestness of conception is in any way inferior to the technique, although we have no doubt a different degree of conviction expressed by Fra Angelico. And the classical landscape of Titian or Tintoret is of its type supreme.

[248] This statement of Hegel again requires parenthesis or at least interpretation. There is a realism such as that we find in the most consummate work of a Titian, or the genre work of the Dutch school, or our own Pre-Raphaelites, to say nothing of mere academical realism, which hardly comes within his remarks. It is obvious that the Ideal is subserved in different degrees by such examples, and in fact to preserve that unity of conception despite the greatest elaboration, *is* to serve the Ideal at least in one aspect of it. Hegel, at least in the concluding part of this paragraph, appears mainly to have in his mind still life and the genre pictures of the Dutch, and rather seems to overlook his own statement as to the necessity of selection and the power to express detail by the shorthand of genius rather than deliberate imitation.

[249] *Grossartigkeit.*

[250] *Innigkeit.* Intimate ideality, inwardness.

[251] I am not sure what Hegel means by the expression *Nicht das Niedrige ist zerdrückt.* If the text is correct I suppose it means the sensuous side does not make way for a more spiritual synthesis. What we should expect is some other verb than *zerdrückt* such as *ausgedrückt*, the sense being that "*though* the mean emotion is not expressed, and no rage, etc., is asserted, *yet* despite of it all," etc. I think there must be some misprint here.

[252] *Ein starres Beisichseyn.* Compare the expression lower down *affirmatives Fürsichseyn* with which it contrasts.

[253] *Für sich bestehende Herz.*

[254] *Als ein göttliches Moment.* It means an actual phase in the Divine existence.

[255] An important statement. Hegel's words are *Sondern wir müssen das geistige Daseyn im Bewusstseyn des Menschen als die wesentliche geistige Existenz Gottes ansehn.*

[256] A bad master at any rate for such a subject.

[257] This metaphor appears to me rather confused, and in fact I do not pretend wholly to understand its meaning. I suppose the idea is that beyond the clouds of soul-life there are the clouds that obscure Providence. In all this passage Hegel shows his limitations as an art student.

[258] *Näher.* That is our love of God is mainly through Christ.

[259] *Ein bloss eingelnes Moment.* A phase that passes or becomes relatively insignificant.

[260] *Innigste*, most intimate. A curious but characteristic conclusion of Hegel.

[261] This analysis must be accepted of course mainly as an analysis of the ideal proposed to us by the profoundest Christian art. It is obviously not true of much Italian art, Titian's work for example, and it is equally remote from many of the most probable facts of history.

[262] *Die Starrheit.* The rigid or unyielding character.

[263] *Der Gehalt ihres Gemüths.* It is possible to see in this analysis something rather capricious and far-fetched, and yet to appreciate its value as an analysis of Christian love for the deceased beloved as contrasted with pagan sentiment. The finest illustration I myself can recollect of this is not the mother Mary at all, but the figure of the Magdalene in Tintoret's "Deposition" in the S. Giorgio Maggiore Church in Venice. As a matter of fact the divine mother in sacred art is almost invariably depicted in a state of swoon under the stress of her grief, though Tintoret's Pietà in the Brera is a notable exception.

[264] I do not know this painter. For pathos I know no finer conception of the death than that of Rembrandt's etching. Blake's drawing, exhibited recently at Cambridge, shows us the tranquillity and dignity of the scene more finely than any other representation.

[265] I presume Hegel means this by the words *die Menschheit*, but it is a difficult passage.

[266] It is impossible in English to preserve the antithesis between *bitten* and *beten.*

[267] *Und nichts für sich hat.* That is to say reciprocity is of its essence. “Give and it shall be given unto you.”

[268] *Die Gestalt* may possibly refer to the suppliant.

[269] The Sistine Madonna.

[270] A good instance is the great Crucifixion of Fra Angelico in the S. Mark convent in Florence.

[271] And a painter like Carlo Dolci or the Caracci are even worse.

[272] It would perhaps have been more instructive to consider the difference of temperament in the artist when dealing with such subjects and its influence on his treatment. It is very far from an obvious truth that physiognomy upon which the conflict of soul-life is most marked loses thereby the characteristics of beauty. There is the beauty of gnarled oak no less than that of the rose and the lily.

[273] *Das Beisichseyn der Liebe im Absoluten.* Lit., the self-inherency cf Love within the Absolute.

[274] *Sondern auch selbständig.* He seems to mean that they receive from this relation the subsistent individuality of spirit. This reference to landscape is obviously very perfunctory and insufficient.

[275] See vol. I, p. 220.

[276] *Mit dem in sich particularisirten Innern.* With the ideal complexus of particular objects as related to one subject. Their particularity is due to their characterization, and that is dependent on idealization.

[277] *Diess Verwachsenseyn.* Lit., this growing up with.

[278] There is, however, the aspect of consummate execution which in itself is a very real source of artistic enjoyment, and Hegel rather seems to overlook this here.

[279] *Verzweigungen.* All off-shoots of attention or interest.

[280] Of course, even in the painting of still life, artistic composition itself implies by its selection and subordination to an idea a new result. And the characteristic technique of a painter inevitably has the same result.

[281] *Geistigen Ausdrück.*

[282] *Grundlage.*

[283] It is perhaps rather strange that Hegel should have considered the Dutch and Flemish schools as pre-eminently colourists. Apart from Rembrandt the truth is not very apparent. But he was mainly thinking of their dexterity in the lighting of a picture and the scintillation of colour.

[284] That is, as black and white and its gradations.

[285] It is not quite clear what is intended here by *Vervielfältigung*, probably power of being adapted to various subject matter and modes of expression.

[286] It is hardly necessary to point out that this discussion, being based on Goethe's false theory of colour in opposition to Newton's prismatic analysis, has no scientific value, though historically of interest. The blueness of the sky is due to the blue rays being detained.

[287] I presume by concrete unity Hegel refers in some form to a unity that is such owing to its intrinsic nature.

[288] But red quite as often symbolizes enthusiasm and love, and in Tintoret's Paradise the Virgin has the red tunic and the blue mantle.

[289] As a matter of fact violet or purple is a cardinal colour.

[290] Green is not a cardinal colour.

[291] Hegel seems to have in view the Flemish school rather than the Dutch in the restricted sense. It is rather strange that he should dwell on this rather than work of the Venetians such as Bellini.

[292] *Verschwemmte.* Carried away by a stream.

[293] Such as Ary Scheffer and others of the same monotony. The flesh tints of Leighton and Poynter and many less men suffer in the same way.

[294] *Farbenschein*, as Hegel uses it later on, I find it impossible to translate in one word. In fact it is not easy to seize precisely what he means. "Modulation of colour" partly expresses it. But he also

seems to refer to what we understand as the personal quality of a picture or its general atmosphere, not regarded simply as Nature's atmosphere, but as the communication of the artist's own afflatus.

[295] I crossed a young landscape-artist of growing fame the other day, who affirmed and endeavoured to express in his pictures the conviction that colour was as strong in distance as foreground. His pictures were of great interest, but I still think his robust theory unsound.

[296] We have no English equivalent for the German *das Incarnat* or colour incarnate.

[297] *Ein ideelles Ineinander.* By ideal Hegel means apparently that the distinctions of tint fine away beyond the grasp of sense vision. This of course is true in all natural colouring. Possibly he may mean that the idea of Life is contributive to the result.

[298] Hardly a just simile for the reason that, as Hegel himself points out, flesh does not reflect external objects.

[299] *Den Schein innerer Belebung.* This expression seems to prove that Hegel uses the word *ideel* in its ordinary sense of spiritual ideality.

[300] *Als selbst lebendiges Ganze.* The colour must appear as itself a part of the vitality, not a mere covering.

[301] *Vertreibung.* What Hegel exactly means I am not sure, probably finish by over-paintings.

[302] Fresco painting is strictly in tempera. I suppose Hegel has here before him the two processes of tempera painting on the wet wall of plaster and tempera painting on some other dry surface.

[303] *Zu grosser innerer Klarheit und schönen Leuchten.* I give what appears to me to be the meaning.

[304] I presume Hegel understands by *Deck und Lasurfarben* the distinction of our opaque and transparent colours such as flake white and the madders or umbers. He clearly refers to glazes.

[305] *Die Duftigkeit, Magie in der Wirkung des Kolorits.* This is a difficult passage to translate, and I am not quite sure what Hegel is aiming at. He seems to have in his mind both the ideal atmosphere of a composition and the presence of a personal style.

[306] Hegel has already related the effects considered to the artist's personality. He now endeavours to examine more closely what is implied in the relation.

[307] Adriaen van Ostade, 1610-1685.

[308] He means painting, of course. He never passed beyond the stage of the average amateur.

[309] *Spiel von Scheinen.* The play of appearance, that is, as it strikes on different natures.

[310] *Malerischen Auffassung.* Here the ideas on mental conception and artistic composition seem to be combined. But Hegel is rather loose in his use of them.

[311] Hegel has doubtless Albrecht Dürer and yet earlier German art in his mind.

[312] *Die besonderen Bestimmungen.* The lines of its definite exposition.

[313] I adopt Hegel's generic term. But he means here little more than delineation or composition.

[314] As between the art of painting and those of poetry and music.

[315] *Geistig.* We may say the same thing of Tintoret's great Golden Calf picture. But the objection to the composition as a work of art remains more strongly than is the case with Raphael's picture.

[316] The same thing is a characteristic of Tintoret's Annunciation in the S. Rocco Scuola and several pictures of Dürer.

[317] Fine examples of this are Rembrandt's Descent from the Cross in the Munich Gallery, and the group of mourners in Tintoret's Great Crucifixion.

[318] They have in this respect been well contrasted with the characters of Euripides in the play of Aristophanes which particularly emphasizes the difference between the heroic type of Aeschylus and the realism of Euripides, "The Frogs of Aristophanes," text and translation of B. B. Rogers; see Introd., pp. XVIII, XIX, XLV.

[319] As to ugliness and its treatment by Hegel, see Professor Bosanquet's "History of Aesthetik," pp. 338, 355, and generally pp. 432-436.

[320] That is sculpture. Hegel calls it *im Plastischen.*

[321] An ideal with Hegel is not necessarily an image of the mind, but far more generally the concrete realization of life.

[322] He should have added Tintoretto at least. What could be more pertinent than his Sages in the Palazzo Reale in Venice.

[323] Applies to the study rather than the talent exercised.

[324] *Aber ganze Grundbild des Charakters darstellen.*

[325] *Den geistigen Sinn und Charakter.* He means the entire spiritual impression, heart, soul, and intelligence, with its practical effect in substantive character.

[326] I think this is implied here in Hegel's use of the words *verarbeitet durch den Geist.* But it may mean "in the face as worked upon the soul within the *person portrayed.*"

[327] *Die wahrhaften absoluten Momente für die Characteristik.*

[328] The German expression is, "It is not a serious affair with her sinning." I am not sure that Hegel's view here does not lean towards the sentimentalism he generally so strongly opposes. No doubt a clear conception of the Magdalene's character is difficult. But it is obvious that the less stress we lay upon her sin, the less weight her conversion carries from the religious point of view, and the less great appears the effect of the interposition of her divine Master. Correggio was not a master likely to penetrate profoundly into his subject. But, on the other hand, it must be admitted that Hegel's contention is in one aspect of it supported by the far finer conceptions of the Magdalene in Tintoret's work. At least this great master clearly shows us that in his view of her she was strongly emotional, heart and soul in everything whether for good, under good influence, or for evil under opposite direction. It is possible to understand Hegel's interpretation as one mainly aesthetic.

[329] In Berlin. The statement is made in February 1829.

[330] The omission of the Spanish school at least omits a most important link with modern impressionism and its close relation to that transition to music. And it is impossible to indicate the progress of landscape without reference to the English school.

[331] "Ital. Forsch.," vol. I, p. 279.

[332] The words *in ähnlicher Weise* make no sense.

[333] "Ital. Forsch.," vol. I, p. 280.

[334] Literally the sense is “Which (apparently agrees with the trait of piety) invigorates with soul that assuredness and accepted fact (*Fertigkeit*) of existence, which is from the very first (*von Hause aus*) more decisive (*entscheidenere*) in this province of salvation (*des Heils*).” *Heils* must obviously be used in the same sense as *Heiland* above. My translation is necessarily rather free, but I hope I have emphasized the meaning.

[335] *Ein ideal bleibender Uebergang.* The transition is rather one the soul imagines than an actual fact. “Ideal persistence” is perhaps better.

[336] *Religiosität* here used in good sense.

[337] Lit., “More free from struggling.” Compare Saint John and Saint Paul as examples on the higher levels.

[338] That is Italian painting.

[339] Hegel’s delight in Italian opera is well known to readers of his correspondence. In the above fine passage he to some extent unbelts himself from his ordinary tone of rather austere reticence.

[340] The distinction seems to be between the more formal unity of personality and the peculiarly seductive charm of Italian art. It is rather a fine one and it seems to me rather confusing. Moreover I do not quite see the pertinency of the simile of a Psyche that is wafted as a butterfly even round blooms that have been spoiled of their treasure, for such I understand to be the sense of *verkümmerte Blumen.* A butterfly comes into no active relation with such unless the idea is pictorial decoration. But possibly Hegel was thinking of his reference to Dante, and in that case employed the metaphor loosely, rather too loosely I should say.

[341] “Stunted” is perhaps the best translation. The fault of the simile lies in its superficiality. It does not penetrate the conception Hegel has before him.

[342] Giotto, Mantegna, Carpaccio, Masaccio, would be leading names in point here. Hegel mentions two himself lower down.

[343] “Ital. Forsch.,” vol. II, p. 4.

[344] *Grelle.* That is harsh and flagrant outline.

[345] *Ihrer* must refer I think to the Italians, though the sentence might mean, “In contrast to these Greek productions.”

[346] *Als Ueberzug.* The expression suggests it was used as a facial glaze or varnish.

[347] “Ital. Forsch.,” vol. I, p. 312.

[348] That is mixed with the attrited colour in its dryness.

[349] *Leimen. Leim* is size or lime, in the compound word *leim-farbe* signifying distemper.

[350] “Ital. Forsch.,” vol. II, p. 42.

[351] Decam. Giorn., 6. Nov. 5.

[352] Such as S. Francis as presented us in Giotto’s great frescoes in Assisi.

[353] No doubt the serious aspect is less imposingly emphasized; but if the opinion condemned below is too sweeping it remains the fact that we can imagine nothing more profoundly serious in the religious sense than the frescoes in the Arena Chapel in Padua.

[354] “Ital. Forsch.,” vol. II, p. 73.

[355] “Ital. Forsch.,” vol. II, p. 213.

[356] *Aufgaben*, artistic problems, themes.

[357] “Ital. Forsch.,” vol. II, p. 243.

[358] This of course is too strong a statement, and indeed is ridiculous to anyone who has complete knowledge of the best work even of Giotto.

[359] “Ital. Forsch.,” vol. II, p. 252.

[360] The frescoes of Mantegna, and those of Ghirlandaio, we would mention in particular the fine examples in the S. Maria Novella church in Florence, or for Mantegna our own cartoons at Hampton Court and the invaluable but now hopelessly ruined frescoes of Gozzoli, in the Campo Santo of Pisa, are fine illustrations of the text.

[361] *Des inneren Geistes* may here refer to the ideal aspects of civil and domestic life, but I think Hegel is contrasting the two extremes and it refers to the religious content.

[362] "Ital. Forsch.," vol. II, p. 282.

[363] To make this judgment in any degree a sound one we must assume the stress is laid on the mysterious aspect of expression and form. The genuine examples of Leonardo are so very few. But quite apart from that unless we exclude the great triumvirate of the Venetian school altogether Tintoret, Titian, and Veronese, the praise here given to Leonardo as a consummate master of the technique in oil-painting can only be received with considerable reserve and qualification.

[364] Compare "Ital. Forsch.," vol. II, p. 308.

[365] *Die reinste Vollendung.* The adjective refers to the character of the perfection as an expression of artistic feeling and execution.

[366] *Halbdeutliche Erinnerungen.* Not I think memories that are obscure themselves so much as memories which have failed to grasp the content of what is recollected. The expression is rather confused.

[367] Modern criticism would doubtless have a good deal to say in qualification of this. The name of Bellini alone is sufficiently suggestive.

[368] This emphasis on the work of Raphael and Correggio is characteristic of the best art criticism of the times of Hegel, but marks its limitations. Neither Raphael nor Correggio can be called religious painters in the sense that those profound masters Tintoret and Michelangelo were such. The essentially academic aspect of so much of Raphael's later production is not noticed. And it is these three great names, Titian, Tintoret, and Michelangelo, who most truly mark the transition to our modern outlook.

[369] *Eine aüssere Abgeschlossenheit.* This must mean, I think, a dignified and reserved treatment of the technique mainly of such themes.

[370] The technical and somewhat long-worded aspect of Hegel's style is here at its worst and I find it hard to make complete sense of this doubtless unrevised passage. The main difficulty is this, that the sentence appears to assert that "the centre" (*der Mittelpunkt*) of religion persists (*fortbleibt*) and yet asserts in the same breath that the informing unity is broken up. I have done my best.

[371] A piety which is not merely emotional, but is concrete in active life, possesses practical content.

[372] See note at end of chapter.

[373] This appears rather to contradict what Hegel has said before of the impression a fine picture such as Correggio's Magdalene leaves upon us that we cannot imagine the character to be other than it is. See note below.

[374] More literally, "Without the alleviating effect of what is comic."

[375] I presume *die Formen* refers here rather to the artistic forms of grouping and composition than the traits of vital expression. But perhaps the latter interpretation would be more natural to the words.

[376] The above survey of Dutch art is of great interest, and in its careful comparison of the type of that art with the national development of the Dutch may be contrasted favourably with the somewhat prejudiced criticism of such a critic as John Ruskin. At the same time I think it must be obvious that Hegel is a little inclined to overrate the ideal aspect of that portion of it we may indicate in the work of painters such as Wouvermans or Teniers, many examples of which are little removed from the defects of theme he points out in more modern work. Also personally I should say that, if we exclude the supreme genius of Rembrandt, he rather exaggerates their rank as supreme colourists in respect to the scintillation, mystery, and other effects of light. To consider that they rank above the Venetians in this respect is wholly impossible, to say nothing of Velasquez. Rubens, however, may add some support to the view, but he is hardly in the school described, and Van Dyck stands with him.

CHAPTER II

MUSIC

INTRODUCTION

If we glance back at the course the evolution of the several arts has taken, we shall find that it began with *architecture*. It was the art which was least complete; for, as we discovered, it was, by reason of the purely solid material, which it attached to itself as its sensuous medium, and made use of according to the laws of gravity, incapable of placing before us under an adequate mode of presentation what is spiritual; it was consequently constrained to limit itself to the task of preparing from the resources of the mind an artistic external environment for Spirit in its living and actual existence.

Sculpture, on the contrary, and in the *second* place, was able, it is true, to accept the spiritual itself as its object. It was, however, neither one in the sense of a particular character, nor as the intimate personal life of soul, but rather as a free individuality, which is as little separate from the substantive content as it is from the corporeal appearance of Spirit; a presentment which only displays itself as such individuality, in so far as the same enters into it, in the degree that the same is actually required to import an individual vitality into a content which is itself intrinsically essential. Moreover, it only, as such ideal spiritualization, is fused with the bodily configuration to the extent of revealing the essentially inviolable union of Spirit with that natural embodiment which is consonant therewith. This necessary identity in the art of sculpture of Spirit's independent existence wholly with its *corporeal* organization, rather than with the medium of its own *ideal*

essence, makes it incumbent upon the art still to retain solid matter as its material, but to transform the configuration of the same, not, as was the case with architecture, into a purely inorganic environment, but rather into the classical beauty adequate to Spirit and its ideal plastic realization.

And just as sculpture in this respect proved itself to be pre-eminently fitted to give vitality to the content and mode of expression of the *classical* type of art in its products, while architecture, despite all the service it rendered in the content which belonged to it, was unable in its manner of presentation to pass beyond the fundamental mode of a purely *symbolical* significance, so, too, *thirdly*, with the art of painting, we enter the province of the *romantic.* No doubt we find still in painting that the *external* form is the means by virtue of which the ideal presence is revealed. In this case, however, this ideality is actually the ideal and particular *subjectivity*, is, in short, the soul-life returning upon itself from its corporeal existence, is the individual passion and emotion of character and heart, which are no longer exclusively delivered in the external form, but mirror in the same the very ideal substance and activity of Spirit in the domain of its own conditions, aims, and actions. On account of this intimate ideality of its content the art of painting is unable to rest satisfied with a material that, in one aspect of it, is in its shape merely solid matter, and in another as such crude form is merely tangible and unparticularized, but is forced to select exclusively the show and *colour semblance* of the same as its sensuous means of expression. The colour, however, is only present in order to make still apparent spatial forms and shapes as we find them in the actuality of Life, even in the case where we see the art developed into all the magic of colouring, in which the objective fact at the same time already begins to vanish away, and the effect is produced by what appears to be no longer anything material at all. However much, therefore, painting is evolved in the direction of a more ideal independence of a kind of appearance which is

no longer attached to shape as such, but is permitted to pass spontaneously into its own proper element, that is, into the play of visibility and reflection, into all the mysteries of chiaroscuro, yet this magic of colour is still throughout of a spatial mode, it is an appearance growing out of juxtaposition on a flat surface, and consequently a *consubsistent* one.

1. If, however, this ideal essence, as is already the case under the principle of painting, asserts itself in fact as *subjective soul-life*, in that case the truly adequate medium cannot remain of a type which possesses independent subsistency. And for this reason we get a mode of expression and communication, in the sensuous material of which we do not find objectivity disclosed as spatial configuration, in order that it may have consistency therein. We require a material which is without such stability in its relation to what is outside it, and which vanishes again in the very moment of its origin and presence. Now the art that finally annihilates not merely *one* form of spatial dimension, but the conditions of Space entirely, which is completely withdrawn into the ideality of soul-life, both in its aspect of conscious life and in that of its external expression, is our second romantic art — *Music.* In this respect it constitutes the genuine centre of that kind of presentment which accepts the inner personal life as such, both for its content and form. It no doubt manifests as art this inner life, but in this very objectification retains its subjective character. In other words it does not, as plastic art, suffer the expression in which it is self-enclosed to be independently free or to attain an essentially tranquil self-subsistency, but cancels the same as objectivity, and will not suffer externality to secure for itself an inviolable presence[377] over against it.

In so far, however, as this annihilation of spatial objectivity, regarded as a means of manifestation, is an abandonment of the same which is itself already in anticipation asserted of the sensuous spatiality of the plastic arts

themselves[378], this principle of negation must also in a similar way have its activity conditioned by the *materiality*, which, up to this point, we have indicated as one of tranquil independent self-subsistency, just as the art of painting reduces in its province the spatial dimensions of sculpture to the simple surface. This cancelling of the spatial form therefore merely consists in this, that a specific sensuous material surrenders its tranquil relation of juxtaposition, is, in other words, placed in motion but is so essentially affected by that motion that every portion of the coherent bodily substance not merely changes its position, but also is reacted upon and reacts upon the previous condition[379]. The result of this oscillating vibration is *tone*, the medium of music.

In tone music forsakes the element of external form and its sensuous *visibility*, and requires for the apprehension of its results another organ of sense, namely hearing, which, as also the sight, does not belong to the senses of action but those y of contemplation; and is, in fact, still more ideal than sight. For the unruffled, aesthetic observation of works of art no doubt permits the objects to stand out quietly in their freedom just as they are without any desire to impair that effect in any way; but that which it apprehends is not that which is itself essentially ideally composed[380], but rather on the contrary, that which receives its consistency in its sensuous existence. The ear, on the contrary, receives the result of that ideal vibration of material substance[381], without placing itself in a practical relation towards the objects, a result by means of which it is no longer the material object in its repose, but the first example of the more ideal activity of the soul itself which is apprehended. And for the further reason that the negativity into which the oscillating medium here enters is from one point of view an annihilation of the spatial condition, which is itself removed by means of the reaction of the body[382], the expression of this twofold negation, that is tone, is a mode of externality which, in virtue of its very mode of existence,

is in its very origination self-destructive, and there and then itself fundamentally disappears. And it is by virtue of this twofold negation of externality, in which the root-principle of tone consists, that the same corresponds to the ideal personal life; this resonance which, in its essential explicitness[383], is something more ideal than the subsistent corporeality in its independent reality, also discloses this more ideal existence[384], and thereby offers a mode of expression suited to the ideality of conscious life.

2. If we now, by a reverse process, inquire of what type this inner life must be, if we are to prove it on its own account adapted to the expression of sound and tones, we may recall the fact already observed that by itself, that is, accepted as a real mode of objectivity, tone, in contrast to the material of the plastic arts, is wholly abstract. Stone and colour receive the forms of an extensive and varied world of objects, and place them before us in their actual existence. Tones are unable to do this. For musical expression therefore it is only the inner life of soul that is wholly devoid of an object which is appropriate, in other words, the abstract personal experience simply. This is our entirely empty ego, the self without further content. The fundamental task of music will therefore consist in giving a resonant reflection, not to objectivity in its ordinary material sense, but to the mode and modifications under which the most intimate self of the soul, from the point of view of its subjective life and ideality, is essentially moved.

3. We may say the same of the *effect* of music. The paramount claim of that, too, is the direct contact with the most intimate ideality of conscious life. It is more than any other the art of the soul, and is immediately addressed to that. The art of painting, no doubt, as we have observed, is able to express in physiognomy and facial traits with other things the inner life and its activity, the moods and passions of the heart, the situations, conflicts, and fatalities of the soul; what, however, we have before us in

pictures are objective appearances, from which the self of contemplation, in its most ideal self-identity, is still held distinctly apart. However much we become absorbed in or penetrate into the object, the situation, the character, the forms of a statue or a picture, admire a work of art, lose ourselves in or possess ourselves with it, the fact still remains that these works of art are and remain objects of independent subsistency, in respect to which it is quite impossible for us to escape the relation of external observation disappears. In music, however, this distinction disappears. Its content is that which is itself essentially a part of our own personal[385] life, and its expression does not result at the same time in an objective mode of spatial *persistency*, but discloses, in virtue of the continuity and freedom of its flight as it appears and vanishes[386], that it is a manifestation, which, instead of possessing itself an independent consistency, is dependent for its support on the ideality of conscious life, and only can exist for that inward realm. Tone is therefore no doubt a mode of both expression and externality; but it is an expression which inevitably disappears precisely at the point of and in virtue of becoming externality. At the very moment that our organ of sense receives the sound it is gone. The impression that should be given is at once transferred to the tablets of memory. The tones merely resound in the depths of the soul, which are thereby seized upon in their ideal substance, and suffused with emotion. This ideality of content and mode of expression in the sense that it is devoid of all external object defines the purely *formal* aspect of music. It has no doubt a content, but it is not a content such as we mean when referring either to the plastic arts or poetry. What it lacks is just this configuration of an objective other-to-itself, whether we mean by such actual external phenomena, or the objectivity of intellectual ideas and images. We may indicate the course of our further examination as follows:

In the *first* place we have to define more accurately the *general* character of music and its effect in contradistinction to the other arts, not merely from

the point of view of its material, but also from that of its form, which the spiritual content accepts.

Secondly, we shall have to discuss the particular *distinctions*, in which musical tones and their modes[387] are developed and mediated partly in respect to their temporal duration, and partly in relation to the qualitative distinctions of their actual resonance.

Thirdly, and in conclusion, music possesses a relation to the content, which it expresses, either by being associated as an accompaniment[388] with emotions, ideas, and considerations independently expressed by word of mouth, or by its free expansion within its own domain in unfettered independence.

In proposing now, however, after having thus in a general way specified the principle and division of the subject-matter of Music, to enter into a more detailed examination of its particular aspects, we are inevitably confronted with a peculiar difficulty. In other words, for the reason that the musical medium of tone and ideality, in which the content moves as a process, is of so abstract and formal a character, it is impossible for us to attempt such a closer survey without at the same time broaching technical formulae and definitions such as belong to the relations of tone-measure or distinctions that apply to different instruments, scales, or chords. I must admit to no expert knowledge in this sphere of musical science, and can only offer my apologies for being unable to do more than limit myself to more general points of view and a few isolated observations.

1. THE GENERAL CHARACTER OF MUSIC

The essential points of view which are of general importance in a survey of music we may examine under the following heads of division:

First, we have to compare music on the one hand with the plastic arts, and on the other with poetry.

Secondly, we shall by means of the above comparison be in a better position to understand the way in which music is able to master and disclose a given content.

Thirdly, and as a result of the latter inquiry, we may with more accuracy explain the peculiar effect which the art of music, in contradistinction to the other arts, exercises on the soul.

(*a*) With regard to the first point we should, if we are desirous of setting it forth clearly in its specific individuality, compare music with the other two arts from three distinct points of view.

(*α*) And, *first*, it may be observed that it stands in a relation of affinity to *architecture*, although it is in strong contrast with it.

(*αα*) Our meaning is this. In the art of building the content which should be made apparent in architectonic forms, does not, as is the case in works of sculpture and painting, wholly enter into the configuration, but remains distinct from it as an external environment; so, too, in music, under its aspect of the most specifically romantic art, the classical identity of ideality and its external existence receives its resolution in a similar, if converse, way to that in which architecture, as the symbolical type of presentation, was not as yet wholly able to secure such a unity. For this ideality of Spirit proceeds from what is purely the concentration of soul-life, to ideas and images and the forms of such, as elaborated by the imagination, whereas the art of music is throughout more occupied in expressing merely the element of feeling and furthermore surrounds the independently expressed ideas of the mind with the melodic chime of emotions, just as architecture in its province places around the statues of the god, no doubt in an unyielding way, the reasonable forms of its columns, walls, and entablatures[389].

(*ββ*) In this way tone and its formative combinations is for the first time a medium *created* by art and entirely artistic expression of a wholly different type from that we find in painting and sculpture acting through the

material of the human body and its pose and physiognomy. In this respect, too, music may be more nearly compared with architecture, which does not accept its forms from what is actually presented, but as the creation of human invention, in order to inform them, partly according to the laws of gravity, and in part according to the rules of symmetry and harmonious co-ordination. Music does the same thing in its own sphere, in so far as it from one point of view follows the harmonious laws of tone which depend on quantitative relations independently of the expression of emotion, and in another aspect of it, in the recurrence of time and rhythm no less than in the further development of the tones themselves, in many respects is subject to the forms of regularity and symmetry. Consequently we find operative in music not merely the profoundest ideality and soul, but the most rigorous, rationality. It unites, in fact, two extremes, which readily lend themselves to emphatic contrast in their independent self-assertion. In this aspect of independence music more particularly assumes an architectonic character when we find in it a coherent temple of harmony of its own creatively composed and co-ordinated according to the laws of music, and released from the direct expression of soul-life[390].

(*γγ*) Despite all this similarity, however, the art of tones moves to quite as large a degree in a sphere wholly opposed to that of architecture. We find, no doubt, in both arts as a basis quantitative or more accurately measure relations; the material, however, which in each case is informed, agreeably to such relations, is totally different. Architecture attaches itself to the heavy sensuous material in its tranquil juxtaposition and external form in Space. Music, on the contrary, lays hold of the tone-spirit[391] as it rings freely out of the spatial material in the qualitative distinctions of musical sound and in the flow of a movement subject to the condition of time. For this reason the works of both arts belong to two entirely distinct spheres of spiritual activity. The art of building places in an enduring form its colossal

constructions for external contemplation in symbolical forms. The swiftly evanescent world of tones, on the other hand, directly penetrates through the ears of man to the depths of his soul, attuning the same in concordant emotional sympathy.

(*β*) And if we, in the second place, consider the closer relation of music to the two other plastic arts[392], we shall find that the similarity and distinction, which attaches to such a comparison, is in some measure founded upon the truths already enunciated.

(*αα*) Of these music is furthest removed from sculpture; and this is not merely so in respect to material and type of configuration, but also in that of the completed coalescence of its ideal and external aspects. There is in short a closer affinity between painting and music. In part this is due to the predominant ideality of expression exemplified in both; in part it is referable to treatment of material, in which, as we have already seen, it is permissible for the art of painting to approach the very boundary of music itself. Painting has, however, for its aim in common with sculpture the representation of an objective form in Space, and is restricted in its material to the actual form of things already present outside the sphere of art. It is unquestionably true that neither in the case of the painter nor the sculptor do we accept a human countenance, a position of the human body, the outlines of a mountain, the leafage of a tree precisely in the forms they present to us as here or there in Nature; in both cases we are bound to justify what we have before us under the conditions of the art in question, to adapt it to a particular situation, no less than to employ it as a means of expressing the inevitable artistic result of the entire content of the work. We have, therefore, in both cases on the one hand an independently recognized content, which has to receive artistic individualization, and, on the other, we are confronted with the forms of Nature as they are similarly presented in isolation; and the artist is bound, if he be truly an artist, and seek to unite

these two sources of inspiration in his composition, to discover in both the material and support[393] for his conception and execution. In short, he will, acting in the first instance on the security of such general principles[394], endeavour on the one hand to fill out with more concrete detail the generality of his imaginative idea, and on the other to idealize and spiritualize the human or any other of the forms of Nature, which are submitted to serve him as particular models. The musician, on the contrary, it is true, does not abstract from all and every content, but finds the same in a text, which he sets to music, or with absolute freedom gives musical utterance to some definite mood in the form of a theme, which he proceeds to elaborate. The actual region, however, of his compositions remains the more formal ideality, in other words pure tones, and his absorption of content becomes rather a *retreat* into the free life of his own soul, a voyage of discovery into that, and in many departments of music even a confirmation, that he as artist is free of the content. If we are in a general way permitted to regard human activity in the realm of the beautiful as a liberation of the soul, as a release from constraint and restriction, in short to consider that art does actually alleviate the most overpowering and tragic catastrophies[395] by means of the creations it offers to our contemplation and enjoyment, it is the art of music which conducts us to the final summit of that ascent to freedom. Or in other language that which the plastic arts secure through the objective fact of a plastic beauty, which displays the entirety of human life, human nature as such, its universal and ideal significance, in the detail of its particularity, without losing that essential harmony, this effect music must produce in a wholly different manner. The plastic artist need only *exhibit*, in that which is enclosed in the conception, what *was already therein from the first*, so that every detail in its essential determinacy is merely a closer explication of the totality which already floats before the mind in virtue of the content which is there to exhibit it. A

figure, for example, in a plastic work of art, requires in this or that situation a body, hands, feet, bust, a head with a given expression, a given pose, other figures, or other aspects to which it is related as a whole, etc., and all these aspects presuppose the others, in making collectively essentially complete work. The elaboration of the theme is in such a case merely a more accurate analysis of that which already itself essentially contains it, and the more elaborate the picture is, which thereby confronts us, the more concentrated is the unity, and the stronger becomes the connection of the parts. The most consummate expression of detail must be, if the work of art is the best class, at the same time an elucidation of the highest form of unity. No doubt the ideal articulation and rounding off in a whole, in which the one part follows inevitably from another, ought to be present in a musical composition. But in some measure the execution here is of a totally different type, and moreover we can only accept the unity in a restricted sense.

(*ββ*) In a musical theme the significance which has to be expressed is already exhausted[396]. If it is repeated or carried on to further oppositions and mediations these repetitions, modulations, and elaborations by means of other scales may very readily appear superfluous, and rather are appertinent to the purely musical development and the assimilation of the varied content of harmonic progressions which are neither demanded by the content itself[397], nor remain dependent upon it, whereas in the plastic arts the execution of the detail and the passage to it is simply and always a more accurate exhibition and analysis of the content itself.

But of course it is impossible to deny that another theme is actually motived by the way a theme is developed, and each of them, then, in their alternation or their interfusion progress, change, are at one time suppressed, at another emphasized, and by their victory or defeat are able to make a content explicit in its more definite features, oppositions, transitions, developments, and resolutions. But in this case, too, the unity is not made

more profound and concentrated by virtue of such elaboration as is the case in sculpture and painting, but is rather an expansion, an extension, a correlative series[398], an addition of remoteness or a return, for which the content, which is thus expressed, remains no doubt the universal centrum, yet does not keep the whole so securely together as we find it is possible to do in the plastic arts, particularly where their subject-matter is confined to the human organism.

(*γγ*) Looked at from this point of view the art of music, as contrasted with the other arts, lies too close to the medium of that formal freedom of soul life, and thereby cannot fail to a greater or less degree to be diverted beyond what is actually presented, in other words the content[399]. The recollection of a theme proposed is likewise a self-revealment[400] of the artist, in other words is an ideal realization, to the effect that this self is the artist, and he may progress just as he likes, and by what by-paths he likes. But on the other hand the free exercise of imaginative caprice of the above description is expressly to be distinguished from a musical composition which is essentially conclusive, that is to say, which constitutes a fundamentally self-integrated totality. In the free improvization[401] the absence of restrictions is itself an object, so that the artist is able to assert his caprice in the acceptance of any material he chooses, to interweave acknowledged melodies and motives in his improvized productions, to emphasize some new aspect of such, to elaborate them in a variety of modifications, or make them steps in his progression to other material, and advance from thence in the same way to developments of still more arresting contrasts.

In general, however, a musical composition determines the freedom of the composer, either by limiting it to a more self-contained execution, and the observance of what we may describe as a more plastic unity, or by permitting him with the full force of his personality and caprice to pass at

every point into more or less important digressions, to let spontaneous ideas travel hither and thither as they please, to lay stress for the moment on this or that motive, and then once more to drown it in an overwhelming torrent. While, then, the study of Nature's forms is essential to both painter and sculptor, the art of music can look for no such fixed body of fact outside its own prescribed forms, with which it would be forced to comply. The extent of the regularity and necessity of its formal character is almost wholly determined within the sphere of tone itself, which does not come into so close an association[402] with the definition of the content that is therein reposed, and consequently in respect to deviations beyond the same permits for the most part a considerable opportunity for the free play of the characteristic impulse of the composer.

And this is the main point of view, from which we may contract music with the strictly plastic arts.

(*γ*) Looked at from *another* aspect music is, in the third place[403], most nearly affiliated to *poetry*; both in fact make use of the same sensuous medium, that is, tone. Despite this, however, these arts are very strongly distinct from one another not only in virtue of the mode of treating tones in each case, but also in respect to their different modes of expression.

(*αα*) In poetry, as we have found already in our general differentiation of the several arts, tone is not as such elicited and artistically produced by various humanly constructed instruments, but the articulate sound of the human organ of speech is reduced to the mere symbol of speech, retaining thereby nothing more than the value of a sign of ideas, which is by itself devoid of significance. Consequently we find here that tone remains throughout a self-subsistent sensuous entity, which, as the mere symbol of emotions, ideas, and thoughts, possesses the externality and *objectivity* which is *inherent in itself* simply in virtue of the fact that is a *sign* and nothing more. For the true objectivity of the soul-life as such does not

consist in utterance and words, but in this fact, that I, as subject, am aware of a thought, a feeling, and so forth, that further I confront it as an object, and in this way have it present to the imagination, or forthwith develop for myself what is implicit in a thought or a conception, setting forth in a series the external and spiritual relations of the given content, and relating the particular features of it to one another. Unquestionably we think throughout in language, without, however, needing actual speech as spoken. By reason of this ability to dispense with speech-utterance in its sensuous aspect as contrasted with the spiritual content of ideas, etc., to elucidate which they[404] are employed, tone receives once more self-subsistency. In the art of painting no doubt colour and its arrangement, regarded simply as colour, is likewise by itself without significance, and in the same way, as contrasted with the spiritual embodied, thereby a self-substantive sensuous medium; but we get no painting from colour simply as such: we must first attach to it form and its expression. With these spiritually animated forms colouring is brought into an association by many degrees more constrained than that which pertains to uttered speech and its coalescing result of words with ideas.

If we will now look at the distinction between the poetical and musical use of tones we shall find that music does not depress the tone sound to the mere speech-utterance, but creates out of tone simply its own independent medium, so that, in so far as there is musical tone, it is treated as the object of the art[405]. And on account of this the realm of tone, inasmuch as it cannot serve merely as a symbol, is by virtue of this emancipated function of its life[406] able to attain to a mode of configuration, which makes the form that is its peculiar possession, that is to say, the modes of tone as artistically developed, its fundamental aim and object. In recent times especially, the art of music, by its wresting itself from all content that is independently lucid, has withdrawn into the depths of its own medium. But on this very

account and to this extent it has lost its compelling power[407] over the soul, inasmuch as the enjoyment, which is thus offered, is only applicable to one aspect of art, in other words, is only an interest in the purely musical characteristics of the composition and its artistic dexterity, an aspect which wholly concerns the musical expert, and is less connected with the universal human interest in art.

(*ββ*) All that poetry loses, however, in external objectivity by being able to place on one side its sensuous medium, in so far as that can be wholly dispensed with by art, it secures for itself, in the ideal objectivity of its vision and ideas, which poetical speech presents to soul and mind. For it is the function of imagination to clothe these concepts, emotions, and thoughts in a world that is itself essentially complete[408] with its events, actions, moods, and exhibitions of passion, and by this means it creates works, into which the entire fabric of reality, both in its external aspect as phenomena and in the ideal significance of its content, is brought home to the emotions, vision, and imagination of spiritual life. It is this type of objectivity which the art of music, in so far as it asserts its independent claims in its own province, is compelled to renounce. In other words, the realm of tone possesses, no doubt, as I have already indicated, a relation to the soul, and an alliance which is consonant with its spiritual movement; but it fails to pass beyond a sympathetic relation which is always of an indefinite character, albeit in this aspect of it a musical composition, if originating in the soul-life itself, and permeated by genius and emotions of a rich quality, cannot fail to react on our nature with an equivalent power and variety. In the case of a content and the ideal and personal creation such as poetry implies our emotions pass more completely out of their elementary medium of undefined conscious life into the more concrete vision and more universal[409] imagination which is embodied in such content. This may also be the effect of a musical composition, so soon as the emotions which it

excites in ourselves by virtue of its own nature and the artistic energy that animates it are involved more closely in ourselves with a distinct vision and ideas, and thereby present to consciousness the tangible definition of soul-impressions in a more stable outlook and more universally accepted ideas. This is, however, *our* imagination and vision, which no doubt has been suggested by the musical work, but which has not been itself directly disclosed by virtue of the artistic elaboration of musical tones. Poetry, on the contrary, expresses emotions, perceptions, and ideas as they are[410], and is further able to delineate a picture of external objects, although it cannot itself either attain to the plastic clarity of sculpture and painting or the spiritual intimacy of music, and is consequently obliged to call as auxiliary to its powers the direct vision we otherwise receive through the senses and the speechless apprehension of soul-life in music.

(*γγ*) *Thirdly*, however, the art of music does not confine itself to this independent position over against that of poetry and the spiritual content of conscious life. It allies itself with a clearly expressed content already completely elaborated by poetry, and as the accompaniment of emotions, opinions, events, and actions. If, however, the musical aspect of such a work of art remains the fundamental and predominant one, the poetry, whether in the form of poem, drama, or any other, has no right to assert an independent claim of its own therein. And as a general rule in this association, of music and poetry the preponderance of one art is injurious to the other. If therefore the text, a poetical creation, possesses a fully independent value of its own, the support to be expected from music should be merely an insignificant one, as we find, for example, was the case with the dramatic choruses of the ancients where the music was nothing more than an incidental accompaniment. If, conversely, the music is composed with a more independent individuality of its own, then the text in its turn should be of a more superficially poetical execution, and should as an

independent production confine itself to emotions of a general character and ideas depicted on universal lines. The poetical elaboration of profound thoughts is as little appropriate to a good musical text as is the delineation of the objects of external Nature or descriptive poetry generally. Songs, operatic arias, the texts of oratorios, and so forth may be consequently, so far as the detail of their execution as poetry is concerned, jejune and of a certain degree of mediocrity. The poet must not make his merits as poet too conspicuous if the musician is to find in his text a genuine opportunity. In this respect it is especially the Italians, such as Metastasio and others, who have displayed the greatest skill, while Schiller's poems, which were never written with such an object in view at all, have been shown to be ill adapted and indeed useless for musical composition[411]. In cases where the music receives a more artistic elaboration, the audience understands next to nothing of the text, and this is more particularly so with our German speech and pronunciation[412]. For this reason it is not in the interest of music that the weight of interest should be reposed in the text. An Italian audience, for example, chatters away during the unimportant scenes of an opera, takes refreshment, plays cards, and so on; but the instant an aria of emphatic appeal or an important musical movement begins, every section of it is all attention. We Germans, on the contrary, take the greatest interest in the fortunes and speeches of the princes and princesses of opera with attendants, squires, intimates, and waiting-maids, and we do not doubt there are many among us still who regret the fact, when the singing begins, that the interest is interrupted, and take their refuge in conversation.

In religious music also the text is either for the most part a well-known *credo*, or a selection of single psalms, so that the words are regarded as merely an incitement to a musical commentary, which possesses an independent style peculiar to itself, that is to say one which not merely is used to expound the text, but which for the most part simply emphasizes the

universal character of the content much in the same way that painting selects its material from sacred history.

(*b*) The second aspect of our present inquiry is that of the distinction that obtains between the way in which the art of music lays hold of its subject-matter as contrasted with the other arts, the form, that is, in which, whether it be as an accompaniment or independently of a given text, it is able to apprehend and express a particular content. As to this I have already observed that music is not only more capable than the other arts of liberating itself from an actual text, but also from the expression of a definite content, in order that it may find its satisfaction in an essentially complete series of combinations, modifications, contrasts, and modulations, which are comprised within the realm of absolute music[413]. In such a case, however, music is empty, without significance, and is, for the reason that one fundamental aspect of art, namely spiritual content and expression, is absent, not really genuine music at all. It is only when that which is of spiritual import is adequately expressed in the sensuous medium of tones and their varied configuration that music attains entirely to its position as a true art, and irrespective of the fact whether this content receives an independent and more direct definition by means of words, or is perforce emotionally realized from the tone music itself and its harmonic relations and melodic animation.

(*α*) In this respect the unique function of music consists in this, that whatever its content may be it is not so created by the art for human apprehension as though it either was held by consciousness as a *general concept* is so contained, or as definite external form is ordinarily presented to our perception, or as such receives its more complete reflection in the artistic counterfeit, but rather in the way in which a content is made a living thing in the sphere of the *personal soul.* To make this essentially veiled life and in weaved motion ring forth through the independent texture of tones,

or attach itself to expressed words and ideas, and to steep such ideas in this very medium, in order to re-emphasize anew the same for feeling and sympathy, such is the difficult task assigned to the art of music.

(*αα*) The life of soul itself is consequently the form in which music is able to grasp its content, and thereby seeks to absorb within itself everything that can generally enter into the shrine of the soul and above all disclose itself under the veils of emotional movement. But from this it necessarily follows that the art of music must not attempt to minister to sense-perception, but must restrict its effort to making soul-life intelligible to soul, whether this is effected by its making the substantive and ideal depth of a content as such penetrate to the very core of soul itself, or by its preferring to disclose the life and motion of a content in the soul of some particular person, so that this inward life of itself becomes its actual object.

(*ββ*) This abstract inwardness of soul is in the most intimate sense differentiated, under the mode in which music is related to it, by *feelings* in other words the self-expanding medium of the personal subject, which unquestionably moves in a content, but suffers the same to persist in this direct self-seclusion of the Ego, and in a relation to the Ego, that is, void of externality. Consequently feeling is throughout simply all the envelope of that content, and it is the sphere which is claimed by music[414].

(*γγ*) It is a province which unfolds in expanse the expression of every kind of emotion, and every shade of joyfulness, merriment, jest, caprice, jubilation and laughter of the soul, every gradation of anguish, trouble, melancholy, lament, sorrow, pain, longing and the like, no less than those of reverence, adoration, and love fall within the appropriate limits of its expression.

(*β*) Tone as interjection, as the cry of grief, as sigh and laughter, is already, outside the province of art, the most immediately vital expression of soul-conditions and feelings, the ah and oh of the soul. We find in it a

self-production and objectivity of soul as such, an expression which stands intermediately between unconscious absorption and the self-return to thoughts ideally determinate, a disclosure, which has no relation to external fact, but is confined to the contemplative state, just as the bird, too, in its song possesses this enjoyment and this production of its inner self.

The purely natural expression, however, of interjections is not as yet music, for though these outcries are no doubt no intentionally articulate sign of ideas as speech is and consequently express no conceived content in its generalized form as concept, but give vent to a mood and emotion in and through tone itself, a state which is reposed immediately in similar tones and opens the heart in the outburst of the same, yet this emancipation is not one which is promoted by art. The art of music must on the contrary bring the emotions into tone relations of definite structure, and wean the expression of Nature of its wildness, its uncouth deliverance, and ameliorate it.

We may perhaps say that interjections constitute the point of departure of music; but it is only music when an interjection in the form of a cadenza, and in this respect it has to elaborate its senuous material artistically in a higher degree than either painting or poetry before it is qualified to express the content of spirit. We shall have to examine later on more narrowly the particular way in which the content of music is worked up to such a pitch of adaptability; at present I will merely repeat the observation that the tones are themselves essentially a totality of differences, which are capable of disuniting and uniting themselves in the most varied kinds of immediate concords, essential discords, oppositions and transitions. To these opposed and united tones, no less than the differentiation of their movements and transitions, their entry, their progression, their conflict, their self-resolution and their disappearance, the ideal character both of this or that content and of the emotions, in the form whereof both heart and soul obtains the

mastery of such content, corresponds in closer or more remote affinity, so that the like tone relations, apprehended and informed conformably thereto, disclose the animated expression of that which is present to Spirit as definable content.

The medium of tone asserts itself as more cognate with the ideally simple essence of a content than the senuous material previously dealt with for this reason that tone instead of making itself secure in spatial form and coming to a halt as the varied presentment of juxtaposition and extension, is comprised in the ideal realm of *Time*, and for this reason does not progress to a condition under which simple ideality and concrete bodily shape and appearance are differentiated. And this is equally true of the form of the *feeling* of a content whose expression mainly falls upon the art of music. In other words in sense-perception and conception we have already, as in self-conscious thought, the necessary distinction between the perceiving, conceiving and thinking Ego and the object of perception, conception, and thought. In emotion, however, this distinction is resolved, or rather it is never propounded, but the content is interwoven with the inner life without such division. When consequently music is united as an art of accompaniment with poetry, or conversely poetry is united with music as an interpreter to its elucidation, in such a case music is unable to render conspicuous in an external form or to reflect with intention ideas and thoughts as they are thus apprehended by self-consciousness; it is obliged as stated either to offer the simple character of a content in true relations to feeling, as they are cognate with the ideal relation of this content, or to seek more nearly to express, by means of tones which accompany and give intensity to poetry, that feeling itself, which the content of perceptions and ideas can arouse in the spirit that is both sympathetic and imaginative.

(*c*) Following the course of these remarks it is possible in the *third* place to form an estimate of the unrivalled power which is thereby directly

exercised by music on the soul, which is neither carried forward to the vision of reason, nor diverts consciousness in isolated points of view, but is accustomed to live within the ideal range and secluded depths of pure emotion. For it is precisely this sphere, the intimacy of soul-life, the abstract appropriation of its own realm, which is grasped by music, which thereby sets in movement the source of these ideal changes, namely, the heart and soul, which we may consider at this concentrated focus and centre of our entire manhood.

(α) In a particular sense sculpture endows its art products with a wholly independent subsistency, an objectivity essentially exclusive whether we regard it from the point of view of its content, or that of its external art-manifestation. Its content is the substantive being of the life of Spirit possessed no doubt with individual vitality, but along with this reposing in self-subsistent coherence on itself; its form is the material configuration under the condition of space. For this reason a work of sculpture retains as an object of sense-perception the highest degree of self-subsistency. A picture, as we have already pointed out in our consideration of the art of painting, comes into closer contact with the spectator. In part this is due to the essentially more subjective[415] content thereby depicted; in part it is referable to the fact that it is merely the show of reality which it displays, thereby making us aware that it is not a thing independently substantive, but rather essentially something intended for something else, and exclusively so, in other words for the human vision and soul. Yet even in the case of a picture we have still left us a freedom more independent it fails to absorb; even here we have still only to do with an object externally presented, which only reaches us through sense perception, and only thus excites our emotion and imagination. The spectator may consequently approach the work of art as he likes; he may observe this or that aspect of it; he may analyse the whole, as it throughout persists confronting him, may make it

the object of various reflections, and in short remain throughout at liberty to continue his independent review of it.

(*αα*) The musical work of art, on the contrary, no doubt, as such a work, posits in like manner the incipiency of a distinction between the work itself and the individual that enjoys it; that is to say in its actually resonant tones it receives a sensuous existence that is distinct from the soul of the listener. But on the one hand this opposition does not proceed, as in the case of the plastic arts, to an external subsistency in Space and the visibility of a mode of objectivity that coheres independently, but on the contrary makes its real existence vanish in the immediate passage through Time. On the other hand the art of music does not make the separation of its external material from its spiritual content in the same way that poetry does so, in which the aspect of idea is elaborated with more definite independence from the sound of speech[416], and more cut off as it is than any of the arts from this aspect of externality, issues as such in a unique progression of mental ideas constructed by the imagination. No doubt the observation may readily be made here that, agreeably with what I have already stated, the art of music is able to conversely to release tones from their content and thereby give them independent form; this liberation is, however, not that which really falls within Art's province, which on the contrary wholly consists in employing harmonious and melodic motion for the expression of the content originally selected and the emotions, which the same is qualified to excite. Inasmuch as, therefore, musical expression has for its content the inward life itself, the ideal significance of fact and emotion, and a tone-world which, at least in art, does not proceed to spatial configuration, and in its sensuous existence is wholly evanescent, it follows that music directly penetrates with its movements to the ideal *habitat* of all the fluctuations of soul-life. In other words it seizes on consciousness, where it is no longer confronted with an object, and in the loss of this freedom from the flood of

tones as it streams on is itself whirled away with it[417]. Yet there is here, too, by reason of the divers directions which music may separately follow, an effect of varied character. In other words, when a more profound content, or, to put it generally, an expression more steeped in soul, is absent, we may find as a result that we experience on the one hand delight in the purely sensuous sound and harmony without any further emotional movement, or, on the other hand, we follow the course of the harmony and melody with our critical judgment, a progression by which the inmost heart of us is no further touched or affected. Or rather we may say that pre-eminently in the case of music there is such a purely critical analysis, for which there is nothing else presented in the work of art to evoke it beyond the skill of an expert in its laboured production[418]. If we, however, withdraw ourselves from this critical science, and give ourselves up unreservedly, we become entirely possessed with the musical composition and are carried with it quite independently of the power, which the art of it simply as art exercises upon us. And the peculiar power of music is an *elementary* force, that is to say it lies in the element *of tone*, in which the art here moves.

(*ββ*) The individual is not only carried away by this medium in virtue of the character of its exposition in any particular case, or simply drawn to it by the specific content thereof; but, viewed simply as self-conscious subject, the core and centre of his spiritual existence is interwoven with the work and himself placed in active relations with it. We have, for example, in the emphasis of the music's current rhythms, an opportunity to beat in time with it, or unite our voices with the melody, and in the case of dance-music at least, we may associate the movement of our legs. And, generally speaking, the claim is made upon us as distinct *personalities*. Conversely, in the case of purely methodical action, which, in so far as it is subject to time relations, is compatible with a distinct beat in virtue of its regularity and possesses no further content, we require on the one hand an expression of

this regularity as such in order that this action shall be present to the individual under a mode that is itself subjective; and, on the other, we require a more intimate realization of this rhythm. Both requirements are supplied by the musical accompaniment. This is effected, for instance, by music as associated with the march of soldiers. Such arouses the soul to the rhythmical beat of the march, makes the individual full of the fact of his marching[419] and steeps him in the harmonious action of it. In something of the same sense the unregulated bustle of a *table d'hôte* and the unsatisfactory excitement it arouses annoys many people. Such feel that the moving up and down, the clatter and chatter should be subject to rule, and as we have in our eating and drinking an empty space of time to deal with, we should have that emptiness filled up for us. Such, therefore, is also an occasion among many others when music will help us considerably, suggesting as it does other thoughts, recreations, and ideas.

(*γγ*) In these instances we are made aware of the connection between the individual soul with *Time* simply, a condition in which the medium of music consists. In other words the inward life regarded as subjective unity is the active negation of the indifferent[420] juxtaposition in Space, and thereby *negative* unity. In the first instance, however, this identity remains in itself entirely *abstract* and void of content, and consists merely in this that it makes itself an object, though it then annuls this objectivity, which is itself of a wholly ideal type and of the same character which the subject of consciousness is, in order thereby to enforce itself as subjective unity. An ideal negative activity of the same kind in its sphere of *externality* is Time. For in the *first* place it effaces the indifferent *co-extension* of the spatial condition and concentrates the continuity of the same in the *point* of Time, the Now. The point of time, however, *secondly*, discloses itself at the same time as *negation* of itself; in other words *this* Now no sooner is than it annuls itself in another Now, and by doing this makes apparent its negative

activity. *Thirdly*, we no doubt do not get, on account of externality[421], in whose element Time is in motion, the truly *subjective* unity of the first point of Time with the next, to which the Now by self-effacement proceeds, but the Now remains throughout in its change always the same[422]. For for every point of Time is a Now, and is as undifferentiated from the other Now, taken as the bare point of Time, as is the abstract Ego from the object, relatively to which it annuls itself[423], and in which it falls into self-coalescence, for the reason that this object is itself merely the empty Ego. The actual Ego itself, too, belongs yet more closely to Time, with which it coalesces, in so far as it is, if we abstract from the concrete content of consciousness and self-consciousness, nothing but this empty movement which posits itself as another and then cancels the exchange, in other words cancels itself, in order thereby to conserve the Ego and here only the abstract[424] Ego therein. Ego is in Time, and Time is the being of the conscious subject itself. Inasmuch, then, as Time and not the spatial condition as such supplies the essential element, in which tone secures existence in respect to its validity as music, and the time of tone is likewise that of the conscious subject, for this reason tone, by virtue of this fundamental condition of it, penetrates into the self of conscious life, seizes hold of the same in virtue of the most simple aspect of its existence, and places the Ego in movement by means of the motion in Time and its rhythm; while in addition to this the other configuration of tones, as the expression of emotions, brings yet further a more definite material to enrich the unity of consciousness, a wealth by which it is at once affected and carried forward.

We find, then, that the fundamental ground for the elementary might of the art of music is of this nature.

(*β*) In order, however, that music may exercise its full effect we must have something more than the purely abstract tone in its movement in Time. The *further* aspect we have to attach to it is a *content*, an emotional wealth

steeped in spirit presented to the soul, and the expression, the soul of this content in tones.

We have no right, then, to entertain any exaggerated[425] opinion of the sovereign might of music simply as music, about which ancient writers, both sacred and profane, have told us so many fabulous tales. If we go back to the miracles which Orpheus performed as a pioneer of civilization we find indeed that tones and their movements spread their influence to the wild creatures, which encircled him shorn of their wildness, but they did not extend to humankind, who required the content of a nobler strain. It is something of this latter kind that we must attach to the hymns ascribed to Orpheus, which, in the form we have received from tradition, even though it be not their original one, support mythological and other ideas. In a similar way, too, the warlike songs of Tyrtaeus are famous, by means of which, so we are told, the Lacedaemonians, after long and fruitless conflicts, were stirred up to an irresistible enthusiasm and finally were wholly victorious over the Messenians. In this case, too, the content of the ideas which these elegies excited was the main thing, although pre-eminently in the case of barbaric peoples and in times of deeply moved passions we cannot deny that the musical aspect of them exercised a real force and effect. The pipes of the Highlanders contribute essentially to the animation of their courage, and the power of the Marseillaise as sung in the French Revolution is undeniable. The real source of enthusiasm is, however, to be looked for in the definite idea, in the true interest of the Spirit with which a nation is steeped, and which can be exalted to a more direct and living feeling when the notes of music, the rhythm and the melody carry along whoever may give himself up to them. In our own days, however, we can hardly hold that music is capable by itself of evoking such a courageous temper and contempt of death. Almost all armies nowadays have excellent regimental music, which calls the soldiers to their duties, releases them from such,

gives life to the march and incites them to the attack. No one, however, dreams of beating the enemy with such means. The courage of the field of battle does not come with the blast of trumpets and the beat of drums, and it will indeed take a host of trombones before a fort will tumble in ruin at their blast like the walls of a Jericho. It is the enthusiasm born of ideas, cannon, and the genius of generals which are the main thing now rather than music, and this can only act as a support of the forces which have already filled and taken hold of the soul.

(*γ*) In conclusion, we may point out in respect to the personal effect of musical sound there is an aspect which is referable to the particular manner in which the musical work of art approaches us in its distinction from other works of art. In other words, inasmuch as musical tones do not as buildings of construction, statues, and pictures possess independently a permanent objective consistency, but vanish in the act of passing by the musical work of art requires in virtue of the fact of this purely momentary existence a continuously repeated *reproduction.* And what is more, the necessity of such a renewal of life points to a further more profound significance. For, in so far as it is the personal soul itself, which music accepts for its content with the object, to make manifest itself not as external form and objectively subsistent product, to this extent the expression of it must also assert itself immediately in the form of a communication disclosed by a *living* person, in which that person reposes his entire and unique personality. This is to the fullest extent the case in the song of the human voice, but it is relatively so in all instrumental music, which can only be executed by means of a practised artist and his living and spiritual no less than technical powers as such.

It is only by virtue of this personal relation in respect to the active effect of the musical work of art that the significance of the subjective aspect of music is substantiated, which, however, too, it is possible in this direction to

carry to the extreme length of isolation in the case, that is, where the personal virtuosity of the reproduction as such is made the exclusive focus and content of the enjoyment to be derived.

With the above observations I will now close what I have to say with regard to the general character of music.

2. THE PARTICULAR DEFINITION OF THE MEANS OF EXPRESSION IN MUSIC

We have hitherto contemplated music purely under the aspect, that its function is to embody and give life to tone as the musical expression of the personal life of soul; we have now to ask ourselves the further question, by reason of what it is both possible and necessary that tones are no purely natural outcry of emotion but the articulate artistic expression of the same. For feeling as such possesses a content; tone regarded as mere tone is without such. It must consequently first be rendered capable by means of an artistic treatment of essentially assimilating the expression of an ideal life. Speaking generally, we may establish the following conclusions on this head.

Every tone is a substantive, essentially accepted real thing, which, however, is neither articulated nor consciously apprehended in a living unity, as is the case with the animal or human form, nor from the further point of view demonstrates in itself, as a particular member of the bodily organism, or any isolated trait of the animated body, whether in its spiritual or physical aspect, that this individualization can only exist in vital association with the other limbs and traits, and secure thus its meaning, significance, and expression. Viewed according to external material, a picture no doubt consists in single strokes and colours, which can also independently exist, but the real material on the other hand, which first

creates a work of art from such strokes and colours, the lines and surfaces that is to say of the form, have only a meaning when viewed as a concrete totality. The *separate* tone, on the contrary, is *independently substantive* and can also be animated up to a certain degree by means of emotion and receive a definite expression.

Conversely, however, inasmuch as tone is no purely indefinite rustle and sound, but only possesses in general musical validity by virtue of its clear definition and pure tonality, it stands immediately, by reason of this definite articulation, not merely according to its actual sound, but also its temporal duration, in a relation to *other* tones; nay, this *relation* is that which first contributes to it its real and actual definition and along with this its difference and contrast as opposed to other tones or its unity with such.

In presence of the more relative self-subsistency this relation, however, remains as something *external* to the tones, so that the relations into which they are brought do not appertain to the single tones under the mode of *their notion*, as we find such in the members of the animal and human organism, or also in the forms of natural landscape. The coalescence of different tones in different relations is consequently something which albeit not contradictory to the essence of tone, is, however, in the first instance *artificial*, and not otherwise presented in Nature. Such a relation proceeds to that extent from a *third party* and only exists for such, namely, for the person who apprehends[426] it.

On account of this externality of the relation the definition of tones and their co-ordination subsist in the relation of *quantity*, in relations of number, which of course have their foundation in the nature of tone itself, yet are employed by music in a system which is, in the first instance, discovered by Art and modified[427] in the most varied manner.

From this point of view it is not essential vitality, regarded as organic unity, which constitutes the foundation of music, but equality, inequality,

etc., and generally the form of the understanding[428], as it is asserted in quantitative relations. If we consequently speak definitely of musical tones we indicate the same purely by numerical relations as also by letters selected at will by virtue of which we are accustomed to indicate the tones according to such relations.

In such a reference back to mere quantities and their intelligible, external definition music possesses its most pronounced affinity with architecture, inasmuch as it, just as this latter art does, builds up its inventions upon the secure basis and scheme of proportions, a basis which does not essentially expand and coalesce through vital unity in an organically free articulation, in which the remaining differentiated parts are given with the one aspect of definition, but only begins to grow into free art in the further elaborations, which are enabled by it to arise out of the aforesaid conditions.

Although architecture carries the process of liberation no further than a harmony of forms and the characteristic animation of a mysterious eurhythmy, music, on the contrary, for the reason that it has for its content the most intimate, personal, and free life and essence of the soul, strides into and emphasizes the profoundest opposition that exists between this free life of soul and those quantitative relations on which it is based. It is, however, unable to persist in this opposition; rather it is its difficult function to overcome it as essentially as it accepts it, by assigning to the free movements of the soul, which it expresses, a more secure foundation and basis by means of these necessary proportions, a basis on which it then, however, gives movement to and develops the inner life in the freedom which for the first time receives its fulness of content by virtue of such fundamental necessity[429].

In this respect there are in the first instance two aspects of tone we should distinguish, according to which it is artistically to be employed. First, we have the abstract foundation, the universal but not as yet

physically specified element, that is, *Time*, in the domain of which tone falls. After that we get sound itself, the *real* distinction of tones, not merely according to aspects referable to the difference of the sensuous material, which sounds, but also in that aspect of the tones themselves as they are related to one another, whether in their singularity or as a whole. To such we must then adjoin *thirdly*, the *soul*, which gives animation to the tones, rounds them off in a free totality, and gives to them a spiritual expression in their temporal movement and their real sound. By virtue of these aspects we receive for their more definite classification a series of stages as follows.

First, we have to occupy our attention with the purely temporal duration and movement, which it is the function of art not merely to leave to chance in their arrangement, but to determine according to definite measures, and to render various by virtue of their differences, and once more again to establish their unity in these distinctions. From this we deduce the necessity for *time-measure*, *beat*, and *rhythm.*

Secondly, however, music has not merely to deal with abstract time and the relations of longer or shorter duration, musical phrase and so forth, but with the concrete time of their *sound* according to definite tones, which consequently are not merely distinct from one another according to their duration. This difference reposes, in the first place, on the specific quality of their sensuous material, by reason of whose oscillations the tone is produced; on the other hand it depends on the different number of such oscillations, in which the resonant bodies oscillate in an equal measure of time. And furthermore these differences assert themselves as essential aspects for the relation of tones in their concord, opposition, and mediation. We may give this portion of our subject the general designation of the theory of *harmony.*

Thirdly, and finally, it is the *melody*, by virtue of which on these foundations of a beat characterized by rhythmical vitality and of distinctions

and movements of harmony itself that the realm of tones is unitedly discharged in a spiritually free mode of expression, and conducts us thereby to the final main section of our subject, which will undertake to consider music in its concrete unity with the spiritual content it is intended to express in beat, harmony, and rhythm.

(*a*) *Time-measure, Beat, Rhythm*

So far as in the *first* place the purely *temporal* aspect of musical tone is concerned, we have *first* to discuss the necessity, which generally in musical time is the dominant factor. *Secondly*, we shall consider beat under the aspect of time-measure wholly regulated under scientific rule. *Thirdly*, we shall treat of the rhythm, under which a start is made in animating this abstract rule by the prominence or subordination it attains to definite divisions of time.

(*α*) The figures of sculpture and painting are placed side by side in space and present the extension of reality in actual or apparent totality. Music, however, can only place before us tones in so far as it makes a body under the spatial condition tremble, setting the same in an oscillating motion. These oscillations only affect art under the aspect, that they follow one another; and for this reason the sensuous material generally only enters into music with the *temporal* duration of its movement instead of taking with it its spatial form. No doubt that motion of a body is always present in space, so that painting and sculpture have the right to exhibit the appearance of movement, albeit their figures are in their reality at rest. In respect to this aspect of Space, however, music does not accept movement, and there remains consequently as part of its configuration only the time, into which the oscillation of the body falls.

(*αα*) Time, however, in consequence of what we have already above considered, is not as Space is, the positive condition of juxtaposition, but on the contrary *negative* externality. As juxtaposition, which is cancelled, it is

the point of passage, and as negative activity it is the abrogation of this point of time in another, which is itself immediately cancelled, and becomes another and so on continuously. In the continuous series of these points of time every single tone not merely is asserted independently as single, but is brought from a further point of view into quantitative association with other tones, by which process Time is referable to *number*. Conversely, however, for the reason that time is the unbroken rise and passage of such points of time, which, regarded as mere points of time, possess in this unparticularized abstraction no distinction one to another, for this reason to a like extent time appears as the equable stream, and the duration essentially undifferentiated.

(*ββ*) In this indeterminacy, however, music is unable to leave time. Rather it is compelled to define it more narrowly, to give it a measure, and regulate its stream according to the rules of such a measure. By virtue of this regular treatment we get the *time-measure* of tones. And here at once arises the question, wherefore then once and for all music requires such measure. The necessity of definite periods of time may be evolved from this fact, that time stands in the closest affinity with, the self in its simplicity, which apprehends, and has a right to apprehend, its inward life through the medium of tones; time, in fact, regarded as externality, essentially possesses the same principle, which is active in the Ego as the abstract foundation of all that pertains to the soul and spirit. If, then, it is the simple self, which as soul-life has to be made objective in music, so, too, the universal medium of this objectivity must be treated conformably to the principle of that subjective life. The Ego, however, is not the indefinite continuance and the unbroken[430] duration, but is only self-identity when we regard it as an aggregate and a return upon itself[431]. The assertion of itself, wherein it becomes object, is doubled back in the being thus self-for-itself; and it is only through this relation to itself that it becomes self-feeling, self-

consciousness and so forth. In this aggregate, however, we find essentially a *breaking off* of the purely indefinite change, such as we held time to be in the first instance, in which the rise and suppression, the disappearance and renewal of the points of time were nothing but a wholly formal passage from every now to another present of similar character, and consequently nothing but an uninterrupted progression. In contrast to this empty process the self is that which itself *persists by itself*, the totality whereof essentially breaks up the undefined series of time points, creates an infraction into the abstract *continuity*, freeing the Ego, which recollects itself in this process of discrete division and finds itself again therein, from what is a purely external process of change.

(*γγ*) The duration of a tone does not, agreeably to this principle, pass away in a process of relative indeterminacy, but emphasizes with its beginning and end, which accordingly is a definite beginning and cessation, the series of the time moments, which, apart from it, are not thus distinguishable. If, however[432], many tones follow one after another, and every one of them receives a duration which can be separately distinguished from each other, then we must assume that instead of having that original *indefinite* series *devoid of content*, we only once more get by a converse process the fortuitous, and, along with this to a like extent, the *indefinite variety* of particular quantities. This unregulated rambling about contradicts quite as much the unity of the Ego as the abstract progress forward; and it can only find itself reflected and satisfied in such a varied mode of definition in so far as single quantities are brought under *one* unifying principle, which for the reason that it subsumes the *particular parts* under its synthetic embrace, must itself be a *definite unity*, yet in the first instance as merely an identity of external application can only persist as one of an external type.

(*β*) And this carries us to the further principle of co-ordination which we find in the *time-beat.*

(*αα*) The first thing to be considered here consists in this, that, as stated, distinct divisions of time are united in a unity, in which the Ego independently creates its identity with itself. Inasmuch as the Ego in the first instance only supplies the foundation as *abstract* self this equability, in respect to the advance of time and its tones, can only assert itself as operative under the mode of a uniformity that is itself abstract, that is to say as the *uniform repetition* of the same unity of time. Agreeably to the same principle the beat according to its simple definition can only consist in this, that it establishes a definite unity of time as measure and rule not merely for the deliberate[433] breaking up of the time-series held previously without such distinction, but also for the equally capricious duration of single tones, which are now apprehended together under a definite bond of union, and that it permits this measure of time to be continuously renewed in abstract uniformity. In this respect time-beat possesses the same function as the principle of symmetry in architecture, as, for instance, when this places side by side columns of similar height and thickness at intervals of equal distance, or co-ordinates a row of windows, which possess a definite size, under the principle of equality. We find present in this case, too, an assured distinction of parts and a repetition in every way complete. In this uniformity self-consciousness discovers itself once more as unity, in so far as it in part recognizes its own equality in the co-ordination of a fortuitous variety; partly, too, in the return of the same unity, it is recalled to the fact that it has already been there, and precisely by means of its return asserts itself as the prevailing principle[434]. The satisfaction, however, which the Ego receives through the time-beat in this rediscovery of itself is all the more complete because the unity and regularity do neither apply to time or tones as such, but are something which is wholly appertinent to the Ego,

and is carried into the time relation by the same as a means of self-satisfaction. We do not find this abstract identity in what is wholly of Nature. Even the heavenly bodies retain no regular time-measure[435] in their motions, but accelerate or retard their course, so that they do not pass over equal spaces in identical periods of time. The same thing may be said of falling bodies, with the motion of projectiles, etc., and we may add that animal life to a still less degree regulates its running, springing, and seizing of objects on the principle of an exact recurrence of one definite time-measure. In this respect the time-measure of living things proceeds far more completely from spiritual initiative than the regular definitions of size applicable to architecture for which we may more readily discover analogies in Nature.

(*ββ*) If, however, the Ego is to return upon itself by means of the time-beat by thus appropriating throughout an identity which it itself is and which proceeds from itself, we imply in this, in order that the distinct unity may be felt as a principle, that in a similar degree what is presented to it should be that which is *unregulated* and *not uniform.* It is in short only through the fact that the definite beat of the measure prevails over and co-ordinates what is capriciously unequal, that it asserts itself as unity and regulating principle of a fortuitous variety. It must consequently appropriate the same within itself, and suffer uniformity to appear in that which is not so. This it is which first gives to the time-beat its specific and essential definition to be asserted too in contrast to other measurements of time, which can be repeated relatively to the same principle.

(*γγ*) By reason of this the multiplicity which is enclosed in a given time-measure possesses its definite *standard* according to which it is divided and co-ordinated. From this we arrive, in the *third* place, at distinct *kinds* of *time-measure.* The first thing of importance to notice in this connection is the division of time according to either an *even* or an *uneven* number of

equally divided parts. Of the first kind we have, for example, the two-four and the four-four time. In these even number is predominant. Of the opposite kind is the three-four time, in which the co-ordinate divisions constitute a unity of equal parts, of course, but in a number that is uneven. Both types are to be found united in six-eight time, to take an example, which no doubt numerically appears to be similar to the four-four time, but as a fact, however, does not fall into three but into two divisions, of which, however, the one no less than the other, relatively to its closer aspect of division, accepts three, that is an uneven number, as its principle.

A particularization of this kind constitutes the constantly repeated principle of every particular measure of time. However much notwithstanding the definite time-measure is bound to control the *variety* of the time-duration and its longer or shorter sections, we must not therefore extend its effective power to the length that it places this variety in subjection in a wholly abstract way, that in short, for example, in the four-four measure only four notes of equal length as fourths can appear, in the three-four time only three, and so forth. The regularity restricts itself to this, that as, for instance, in the four-four time the sum of the separate notes are only equal to four equal parts, which may not only be divided into eighths and sixteenths, but conversely may again contract into less divisions, and indeed are capable moreover of more diffuse division.

(*γ*) The further, however, this elastic mode of differentiation is carried the more necessary it is that the essential divisions of the time should be asserted as predominant and also should be indicated in an effective way as an illustration of the fundamental principle of their co-ordination. This is carried out by the *rhythm*, which first gives vital significance to time-measure and the beat. With respect to this vitalization[436] we may distinguish the following points.

(*αα*) In the first place we have *accent*, which to a greater or less degree attaches in an audible way to definite divisions of time, while others pass by on the other hand without an accent. By virtue of such emphasis, or lack of emphasis, which is itself of various kinds, every particular measure of time possesses its particular rhythm, which is placed in exact association with the specific mode of division to which its rhythm applies. The four-four time, for instance, in which an even number is the principle of division, has a twofold arsis; on the other hand there is that on the first note or fourth division, and then, though in weaker power, on the third. The first is called on account of its stronger accentuation, the *strong* accent, the second in contrast to it the *weak* one. In the three-four time the accent rests entirely on the first fourth, in six-eight time on the contrary it is on the first of the eight divisions and the fourth, so that in this case the twofold accent asserts a division of equal length in two halves.

(*ββ*) In so far as music is an accompaniment rhythm is brought into essential relation with *poetry.* In the most general way I will on this merely venture the observation that the accents of the musical beat ought not to directly contradict those of the metre. If, for example, one of the unaccentuated syllables, relatively to the rhythm of the verse, is placed in a strong accent of the beat, while the arsis, or it may be the caesura, falls in one of the weak accents of the music, then we get a false opposition between the rhythm of the poetry and that of the music which it is better to avoid. We may affirm the same thing with regard to the long and short syllables. These also ought in general to fall into harmony with the duration of the tones, so that the longer syllables are coincident with the longer notes, the shorter with the shorter, albeit this accordance is not to be pressed with absolute precision, inasmuch as music is frequently permitted greater play for the duration of its long notes, no less than for the exuberant subdivision of the same.

(*γγ*) In the *third* place we may at once in anticipation observe that we have to distinguish the animated *rhythm of melody* from the abstractly considered and severely regular return of the beat rhythm. In this respect music possesses a similar and, in fact, yet greater freedom than poetry. In poetry the beginning and termination of *words*[437] need not necessarily coincide with the beginning and end of the verse feet; rather a thoroughgoing coincidence of this nature gives us a verse that halts and is without caesura. And, furthermore, the beginning and ending of the sentences and periods ought not throughout to mark the beginning and conclusion of a verse. On the contrary, a period will terminate more satisfactorily in the beginning or even in the middle and near the last feet of the verse. From which point we begin with a new one which carries the first verse into the one that follows. The same thing holds good in the case of music relatively to its time-beat and rhythm. The melody and its different phrases[438] need not absolutely commence with the fall of a beat and close with the conclusion of another: such may in a general way move freely to this extent that the main-arsis of the melody may be incident to that portion of a musical beat, on which, relatively to its ordinary rhythm, no such emphasis applies; whereas, conversely, a tone, which in the natural process of the melody would necessarily receive no accentuated prominence, may quite conceivably be placed in the strong accent of the time-measure, which requires an arsis, so that consequently such a tone, relatively to the time-rhythm, has a different effect from that which the same tone claims to assert as distinct from that rhythm and purely in the melody. This opposition, however, asserts itself most strongly in so-called syncopations. If, on the other hand, the melody absolutely adheres in its rhythms and divisions to the time rhythm it tends to drag, and lacks warmth and invention. In short, what is required is a freedom from the pedantry of metre and the barbarism of a uniform rhythm. A deficiency in more free movement readily increases

the limpness and sluggishness to the point of actual gloom and depression; and in this way, too, many of our popular melodies possess aspects of mournfulness, drag and burden, in so far as the soul merely possesses a means of advance as its expression more monotonous than itself, and in virtue of such is constrained to consign to it also the doleful emotions of a broken heart. The speech of Southern peoples, on the other hand, more especially the Italian, offers a rich field for a rhythm and flow of melody which is more notable for its variety and movement. And it is precisely here that we mark an essential distinction between German and Italian music. The uniform coldness of the Iambic mode of scansion, which recurs in so many German songs, kills the free and jubilant impulse of the melody, and restrains any further rise and devolution[439]. In more recent times Reichard and others, owing to this very fact that they have said good-bye to this iambic drone, have imported into their lyrical compositions a new and rhythmical life, although we still find traces of the former type in some of their songs. However, we do not only mark the influence of the iambic rhythm in songs, but also in many of our most important musical compositions. Even in the Messiah of Handel the composition does not only in many arias and choruses follow the meaning of the words with declamatory truth, but also adheres to the fall of the iambic rhythm, partly in the distinction simply that it makes between its long and short duration, partly in the fact that the protraction of the iambic rhythm requires a more elevated tone than the corresponding short syllable in the metre. I have no doubt this is one of the characteristic features of Handelian music, owing to which we Germans feel so much at home with the same, quite apart from its excellences in other respects, its majestic swing, its victorious onward movement, the wealth it discloses of profoundly religious no less than more simple idyllic emotions. This rhythmical substance of the melody comes more directly to our sense of hearing than that of the Italians, who are

inclined to find in it a want of freedom, as something, too, that strikes the ear as strange and alien.

(*β*) *Harmony*

The further aspect, in virtue of which alone the abstract basis of time-beat and rhythm receives its fulfilment, and thereby is enabled to become actually concrete music is the kingdom of tones regarded as such. This more essential domain of music is dominated by the laws of *harmony.* We have here a further elementary fact to deal with. In other words, a material substance[440] does not only through its oscillation for art emerge from the mere visible reproduction of its *spatial* form, and is carried further into the elaboration of its configuration *in Time*[441], but it produces *distinct* sounds according to its particular physical constitution no less than its different length and brevity and number of vibrations through which it passes in a given period of time, and consequently in this respect, too, Art is compelled to take account of it and give it form agreeably to its own nature.

With regard, then, to this second element we have to emphasize with more accuracy three main points.

The *first* one presented to our consideration is the difference between the various *instruments*, whose invention and elaboration has been found essential to create that totality of musical sound, which in respect to musical sound constitutes a sphere of different tones independently of all distinction of the relation of pitch whether it be a high or a low one.

Secondly, however, musical tone is, quite apart from the different peculiarities of either instruments or the human voice, itself an articulated totality of different tones, tone-series, and scales, which in the first instance repose on quantitative relations, and in the determination of these relations are tones which it is the function of every instrument and the human voice, according to its specific quality, to produce in less or greater completeness.

Thirdly, music neither consists in single intervals nor in purely abstract series of tones, that is, keys unrelated to each other, but is a concrete interfusion of opposed or mediating sound, which necessitates a forward progression and a passage from one point to another. This juxtaposition and change does not depend on mere contingency and caprice, but is subject to definite rules, which constitute the necessary foundation of all true music.

In passing now to the more detailed consideration of these several points of view I am forced, as already stated, to limit myself for the most part to the most general observations.

(*α*) Sculpture and painting discover their sensuous material, such as wood, stone, metals, and the like, or colours and other media of that type more or less straight to hand, or, at least, they are only compelled to elaborate the same in a subordinate degree, in order to adapt them to the uses of art.

(*αα*) Music, on the contrary, which throughout is set in motion through a medium artificially prepared for the purposes of art from the first, must necessarily pass through a distinctly more difficult preparation before the production of musical tones is secured. With the exception of the human voice, which returns us Nature in her immediacy, Music is compelled itself to create all its other instruments of genuine musical tone throughout before it can exist as an art.

(*ββ*) With regard to these means as such we have already above formed our conception of the *timbre* proper to them in the sense that it is the result of a vibration of the spatial medium, is the first excitation thereof of ideal import, which enforces itself as such in contradistinction to the purely sensuous juxtaposition, and, by virtue of this negation of spatial reality, asserts itself as the ideal unity of all the physical qualities of specific gravity and the purely sensuous type of corporeal coalescence. If we inquire further as to the qualitative peculiarities of the medium thus made to emit musical

sound we shall find that in its character as material substance no less than as artificially constructed, it varies greatly. We may have a longitudinal or oscillating[442] column of air, which is limited by a fixed channel of wood or metal, or we may have a longitudinally stretched string of gut or metal, or in other cases a stretched surface of parchment or a bell of glass or metal. In this connection we may draw attention to the following distinguishing features. In the *first* place it is the *lineal* direction[443] which is mainly predominant, and produces the instruments most effective in musical employment; and this is so whether, as in the case of wind-instruments, the main principle is represented by a column of air which is relatively more deficient in cohesion or by a material line adapted to tension, but of sufficient elasticity to be made to vibrate, as is the case with stringed instruments.

Secondly, we have the principle of surface rather than line represented in instruments of inferior significance, such as the kettle-drum, bell, and harmonica. There is, in fact, a subtle sympathy between the self-audible principle of ideality and that type of rectilinear tone[444], which, by virtue of its essentially simple subjectivity, demands the resonant vibration of simple line extension rather than that of the broad and round surface. In other words, ideality is as subject this spiritual point, which is made audible in tone as its *mode of expression.* But the closest approach to the exposition and expression of the mere *punctum* is not the surface, but the simple linear direction. From this point of view broad or round surfaces are not adapted to the requirements and enforcement of such audibility. In the case of the kettle-drum we have a skin stretched over a kettle or basin, which by being struck at a single point sets the entire surface vibrating with a muffled sound. Though a musical sound, it is one which from its very nature, as belonging to such an instrument, it is impossible to bring either to clear definition or any considerable degree of variety. We find a difficulty of an

opposite type in the case of the harmonica and the bells of glass which are set in vibration in it. In this case it is the concentrated intensity of tone which fails to project itself, and which is of such an affecting character that not a few, when hearing it, receive actual nervous pain. But, despite this specific effect, this instrument is unable to give permanent pleasure and is with difficulty combined with other instruments on the rare occasions such an attempt is made. We find the same defect on the side of differentiation of tone in the bell and a similar punctually repeated stroke as in the case of the kettle-drum. The ring of a bell, however, is not so muffled as in the latter; it rings out clearly, although its persistent reverberation is more the mere echo of the single beat as struck at regular intervals.

Thirdly, the human voice may be regarded in respect to the tones emitted as the most complete instrument of all. It unites in itself the characteristics of both the wind instrument and the string. That is to say we have here in one aspect of it a column of air which vibrates, and, further, by virtue of the muscles, the principle of a string under tension. Just as we saw in the case of the colour inherent in the human skin, we had what was in its aspect of ideal unity, the most essentially perfect presentment of colour, so, too, we may affirm of the human voice that it contains the ideal compass of sound, all that in other instruments is differentiated in its several composite parts. We have here the perfect tone, which is capable of blending in the most facile and beautiful way with all other instruments. Add to this that the human voice is to be apprehended as the essential tone of the soul itself, as the concordant sound which by virtue of its nature expresses the ideal character of the inner life, and most immediately directs such expression. In the case of all other instruments on the contrary we find that a material thing is set in vibration, which, in the use that is made of it, is placed in a relation of indifference to and outside of the soul and its emotion. In the human song, however, it is the human body itself from which the soul

breaks into utterance. For this reason, too, the human voice is unfolded, in accord with the subjective temperament and emotion, in a vast manifold of particularity. And this variety, if we consider its distinguishing features sufficiently generalized, is based on national or other natural relations. Thus, for example, we find that the Italians are pre-eminently the people among whom we meet with the most beautiful voices. An important feature of this beauty is to start with the content of the sound simply as sound, its pure metallic quality, which neither fines away in mere keenness or vitreous attenuation, nor maintains a persistent muffled and hollow character, but, at the same time, though never carried to the point of tremolo in its tone, preserves in the compact body of its tone something of the vital vibration of the soul itself. Above all else the purity of voice-production is most essential, or in other words we must have no foreign element of sound asserted alongside of the freest expression of essential tone.

(*γγ*) Such a totality of instruments the art of music can employ, either in separation or complete combination. In the latter case of late years we may note an exceptional artistic development. The difficulty of such artistic collaboration is enormous. Every instrument possesses a character of its own, which is not directly congenial to the peculiarity of some other instrument. It follows from this that whether we are considering the harmonious co-operation of various instruments of different type, or the effective production of some particular quality of sound such as that of wind or strings, or the sudden blast of trombones, or the successive alternations of change that are inseparable from the music of a large choir, in all such cases knowledge, circumspection, experience, and imaginative endowment are indispensable, in order that, in every example of the kind, whether of tonal quality, transition, opposition, progression, or mediation, we do not lose sight of an ideal significance, the soul and emotional value of the music. For example, I find in the symphonies of Mozart, who was a

great master of instrumentation and its sense-appealing, that is its vital no less than luminous variety, a sort of alternation between the different instruments which frequently resembles in its dramatic interplay a kind of dialogue. In one aspect of this the character of some particular type of instrument is carried to a point, which anticipates and prepares the way for that of another; looked at in another way, one kind of instrument replies to another; or asserts some typical mode of expression which is denied to the instrument it follows, so that in the most graceful fashion we thus get a kind of conversation of appeal and response, which has its beginning, advance and consummation.

(*β*) The *second* material which enlists our attention is no longer the physical quality asserted in the sound, but the essential definition of the tone itself, and its relation to other tones. This objective relation, whereby musical tone in the first instance, not merely in its essential and emphatically defined singularity, but also in its fundamental relation to simultaneously persistent tones, expatiates, constitutes the actual *harmonious* element of music, and is based, regarded under its own original physical conditions, upon *quantitative differences* and numerical proportions. A closer examination of the contents of this system of harmony presents, as understood to-day, the following points of importance.

First, we have *separate* tones in their definite metrical relation, and associated with other tones. This is the theory of particular *intervals.*

Secondly, there is the connected series of tones or notes in their simplest form of succession, in which one tone immediately leads up to another; such are the *scales.*

Thirdly, we have the distinctive characteristics of these scales, which, in so far as each starts from a different tone, as its fundamental tone, is thereby

differentiated into the particular *keys* distinct from each other, and into the system of keys which they constitute.

(*αα*) The particular notes do not only receive their tone, but also the more inclusively positive[445] determination of such sound by virtue of a corporeal substance in vibration. In order to get at this determinacy we have to define the type of vibration itself not in any chance or capricious manner, but once for all as it essentially is. The column of air, for example, or the string or surface under tension, which produces sound possesses invariably a certain length or extension. If we take a string, for instance, and fasten it between two points, and set the part of it thus stretched in vibration, the points of initial importance to discover are the thickness of the string, and the degree of tension. If we have these two aspects identical in the case of two strings then the all-important question follows, as was first noticed by Pythagoras, what is the string's length, the reason being that strings, in other respects identical, if of different lengths give a different number of vibrations in the same interval of time. The difference of one of these numbers from another and the relation of any one to another constitutes the fundamental ground for the distinction and relation between different tones in their degrees of pitch as high or low. Doubtless when we listen to notes thus related our perception carries little resemblance to one of numerical relations. It is not necessary for us to know anything of numbers and arithmetical proportions; and indeed when we do actually perceive a string vibrating, such vibration passes away without our being able to apprehend the numerical relation, while of course it is equally unnecessary for us to glance at the body in vibration at all, in order to receive the impression of its tone. An association, therefore, between the tone and its numerical relations may very possibly at first sight strike us, not merely as incredible, but we may receive the impression that its acceptance implies that our sense of hearing and ideal apprehension of harmonies suffer even depreciation

when we look for their cause in that which is purely quantitative. However this may be, it is an undoubted fact that the numerical relation of vibrations in identical periods of time is the foundation of the specific definition of tones. The fact that our sense of hearing is essentially simple is no valid objection. The apparently simple impression, no less than the complex may, in respect to its essential character and existence, carry within its compass other aspects essentially multifold and related fundamentally to something different. When we perceive, for example, blue or yellow, green or red, in the specific purity of these colours, we receive in like manner the appearance of a perfectly simple determinacy, whereas violet readily is decomposed into its constituent colours of blue and red. Despite this fact the pure blue is not a simple fact, but a distinct correlation and fusion of light and shadow[446]. Religious emotions, a sense of right in any particular case, appear to us in the same way as simple; nevertheless all religious feeling, every impression that partakes of this sense of right, is related to ourselves in entirely different ways, though producing this simple feeling as its point of unity.

In just such a manner, then, tone is based upon a manifold, however much we hear and perceive it as something entirely ultimate; a varied nature, which, for the reason that musical tone comes into being by means of the vibration of a body, and thereby together with its vibrations is subject to temporal condition, is deducible from the numerical relation of this oscillation in *time*, in other words from the *determinate number* of vibrations in a given period. I propose to draw attention merely to the following points in respect to this deduction.

Tones that accord in the fullest sense, and on hearing which a distinction is not perceptible as opposition, are those in the case of which the numerical relation of their vibrations is of the *simplest* character; those on the contrary which are not so out and out accordant possess proportionate numbers more

complex. As an example of the first kind we have *octaves.* In other words, if we tune a string, where we shall have the keynote given us by a definite number of vibrations, and then halve the same; in that case this second half will give us in the same time precisely the same number of vibrations as the previous entire string[447]. Similarly in the case of *fifths* we have *three* vibrations to two of the keynote; in the case of *thirds* we have *five* to *four* of the keynote. In the case of seconds and sevenths we have a different kind of proportion; here to *eight* vibrations of the keynote we have in the former case *nine* and in the latter *fifteen.*

(*ββ*) Inasmuch then — we have already referred to this — as these relations cannot be posited as we like, but disclose an ideal necessity for their particular aspects[448], no less than the totality they together constitute, for the like reason the particular intervals, which are fixed by such numerical relations, do not persist in their relation of indifference to each other, but are inevitably comprised together in and as a whole. The first form of this totality of notes thus created is, however, as yet no *concrete* concord of different notes, but an entirely abstract series of a system, a series of notes related under the most elementary mode to each other, and their position within the totality thus comprised. This is no other than the simple series of notes known as scales. The fundamental basis of this is the tonic, which repeats itself in its octave, and is extended through the remaining six notes placed between these limits, which by virtue of the fact that the keynote directly falls into unison with its octave makes a return upon itself. The remaining notes of the scale either harmonize completely[449] with the keynote, as is the case with the fifth and the third, or possess a more fundamental distinction of sound in conflict with it, as is the case with seconds and sevenths, and take their place consequently in a definite series, which, however, I do not now propose to discuss or explain further.

(*γγ*) *Thirdly*, in these scales we find the source of different *keys.* In other words, every note of the scale can, in its turn, be posited as the keynote of a fresh series of notes, which is co-ordinated precisely as the first is. With the development of the scale through an increase of notes the number of keys has correspondingly increased. Modern music avails itself of a larger variety of keys than that of the ancients. Further, inasmuch as generally the different notes of the scales, as already observed, are related to one another in unobstructed harmony, or a relation that deviates from such immediacy in a more fundamental way, it follows that the different series which arise from these notes, taken severally as keynotes, either display a closer relation of affinity, and consequently permit of a passage readily from one to another, or, on account of their alien character, do not so admit of this. Add to this that the keys are divided from each other by the distinction of hardness and softness, that is, as major or minor tonality; in conclusion they possess, in virtue of their key-note, from which they are generated, a definite character, which of itself responds to a particular kind of emotion, such as lamentation, joy, mourning, and so forth. In this particular even writers in ancient times have anticipated much on the subject of distinction between the keys, and applied their theory in many ways to actual composition.

(*γ*) The *third* important matter, with the discussion of which we may conclude our brief remarks upon the theory of harmony, is concerned with the simultaneous concord of the notes themselves, in other words, the *system of chords.*

(*αα*) We have no doubt already seen that the intervals constitute a whole; this totality, however, is in the first instance comprised in the scales and the keys merely in the form of an associated series, in the succession whereof each note is asserted separately in isolation. In consequence the tonal sound remained abstract, because we find here that it is only one particular and

determinate tone that is asserted. In so far, however, as the notes in fact are what they are[450] merely in virtue of their relation to one another, it follows necessarily that their tonal modality should attain also an existence as this concrete body of tone itself, in other words different notes will have to coalesce in one and the same body of tone. In this conjoint fusion, in the composition of which, however, the mere number of notes capable of such coalescence is not the essential point, for we may have a unity of this kind with merely two[451], we possess our definition of *chords.* For inasmuch as the different notes are not definable for what they are as a result of caprice or chance, but are necessarily regulated by virtue of an ideal principle and co-ordinated in their actual succession, it follows that a regularity of similar character will have to declare itself in the chords, in order that we may determine what kind of associations will be adapted to musical composition, and what on the contrary must be excluded. It is these rules which first give us the theory of harmony in the full sense; and it is according to this we find again that the chords are embraced in an essentially regulated system.

(*ββ*) In this system chords are particularized and distinguished in their passage from one to another, inasmuch as it is clearly *defined* notes which thus sound together. We have consequently to consider as an immediate fact a totality of separately distinguishable chords. In attempting the most general classification of these we shall find that the original distinctions we cursorily alluded to in our discussion of intervals, scales, and keys will once again serve us.

In other words the *first* kind of chords are those in which notes come together, which are completely consonant. In the musical effect of these consequently there is no opposition, no contradiction perceptible; the consonance remains completely undisturbed. Such is the case in the so-

called *consonant* chords, the foundation of which is supplied by the *triad.* This confessedly is generated from the key-note, the third, the mediant[452] and the fifth or dominant. In these we find the notion of harmony expressed in its simplest form, or rather the intrinsic idea of harmony generally. For we have a totality of distinct notes under consideration, which assert this distinction while they also declare an undisturbed unity.

We have here an immediate identity, which moreover is not without the element of separation and mediation, albeit this mediation is not at the same time limited by the self-subsistency of different tones[453], satisfied with the mere transitional passage from one note to another in the relation of a series, but the unity is here an actual one and a return in immediacy upon itself.

But in the *second* place we may observe as a further incident of distinct types of the triad, which I cannot now examine in more detail, the deliberate appearance of a deeper mode of opposition. We have, however, already at an earlier stage seen that the scales contain over and above those notes, which coalesce without opposition, others which annul such consonance. Examples of these are the diminished and augmented seventh. Inasmuch as these notes equally belong to the totality of tones, they too will necessarily find an entrance into the triad form. And when this happens it follows that the immediate unity and consonance above mentioned is disturbed, to the extent that we have added a tone essentially of another character, by means of which for the first time we meet with a *genuine difference* which actually asserts itself as contradiction. In this way we have the true depth of musical tone really asserted. It proceeds to contradictions that are fundamental and does not flinch from the acerbity[454] or fracture they involve. And, in fact, the notion in its truth is no doubt essential unity; but it is not only immediate unity, but one which ideally is disrupt, which falls into contradictions. In this sense I have for example in my Logic developed the

notion as subjectivity, but at the same time disclosed how this subjectivity, as ideal transparent unity, is resolved in that which confronts it in opposition, namely, objectivity. And further such subjectivity regarded as itself wholly ideal is nothing more than a one-sided and abstract presentment of it, which as such retains a something else, an opposed other over against it, namely, objectivity, and only becomes subjectivity in the profounder significance of its truth, in so far as it enters into this opposing other-than-itself, overcomes it and resolves it. And for this reason in the world of reality it is to the higher natures that power is given to endure the pain of that fundamental contradiction of conscious life and to overcome it. In order that music therefore may as an art express the ideal significance no less than purely subjective emotion of the profoundest content, that of religion for example, and above all that of the Christian religion, in which the profoundest depth of suffering is an essential constituent, it must possess the means within its empire of tone to depict such a conflict of opposing forces. And a means of this kind it does possess in the so-called dissonant chords of the seventh and ninth[455]. The function of these, however, I cannot venture further to discuss here.

Looking, however, from a general point of view at the nature of these chords I would draw attention to the *further* important point, that they hold what is contradictory, under the mode of contradiction already explained, in one and the same unity. That, however, what is contradictory as such should remain in unity is a contradiction in terms and unintelligible. The very nature and notion of a contradiction assumes that assured repose in it and what it implies is impossible. On the contrary it is as such self-destructive. Harmony is therefore unable to remain in chords of this character; our ear and feeling, in order to obtain satisfaction, imperatively demands their resolution. To the extent of this contradiction we are inevitably impelled to seek a *resolution* of dissonance and a return to the consonant triad. And this

motion, as the return of the principle of identity upon itself, is the movement of truth in the widest sense. In the art of music, however, this completed identity is only possible as a succession of its moments in time, which appears consequently as a series, but declares its collective dependence in this that a necessary movement of an advance, which is essentially self-caused and a movement of change belonging to its very nature, is thereby asserted.

(*γγ*) And this suggests a *third* point it may be as well to draw attention to. In other words just as the scale was an essentially co-ordinate, albeit in the first instance still abstract series of tones, so too the chords do not persist in their isolation and self-consistency, but possess an ideal relation to one another, and a necessary impulse to change and progress. In this advance, although the same can be changed and extended to a far more considerable extent than in the scales, yet again mere caprice is not more possible in the one case than the other. The transition of chord to chord is effected in part by the nature of the chords themselves, and in part by the keys, to which these chords lead us. It is in virtue of this that the theory of music has established many rules, to enumerate and adequately explain which would, however, extend our survey into much too difficult and discursive matters. I must therefore rest content with having confined myself to a few observations of most general interest.

(*c*) *Melody*

Taking now a glance in retrospect on that which, as connected with the means of musical expression, has already engaged our attention, it will be seen that first in order came the mode of configuration appropriate to the *temporal* duration of tones considered as time-measure, beat, and rhythm. We then proceeded to discuss the *actual tones* of musical sound themselves; *first*, that is to say, in the sound produced by musical instruments and the human voice; *secondly*, in the fixed and determinate measure of the

intervals, and the abstract succession of notes that are subject to them in the scale and the various keys; *thirdly*, in the rules which appertain to the different chords and their conjoint progression. The concluding subject, which still remains for us to consider, and in which those previous to it discover their synthetic unity, and disclose in the same the fundamental form by virtue of which tones are for the first time in veritable freedom and union unfolded and co-ordinated, is *melody.*

In other words, harmony possesses merely the essential relations, which establish the law of necessity in the world of tone; but these are not in themselves, any more than beat and rhythm are, actually music: they are rather the substantive basis, the foundation of rule and principle, upon which the soul in its freedom expatiates. The poetry of music, that speech of human souls, which pours forth the ideal atmosphere and the pain of emotional life, and in this overflow is raised with a sense of alleviation above the natural constraint of feeling, by making present to the soul that which actually affects it strongly; by enabling it freely to dally round its essential being, and by liberating it by this very means from the oppression of joys and sufferings — well, this power of soul-expression in the domain of music is in the first instance melody[456]. It is this concluding section of our inquiry, in so far as it constitutes the more supremely poetic aspect of music, the realm of its really artistic creations, while availing itself of the elements previously discussed, which obviously possesses an exceptional claim to our attention. Unfortunately it is just in this direction that we find ourselves confronted with the difficulties already adverted to. In other words, to mention one of them, a detailed and scientific treatment of the subject implies a more accurate knowledge of the laws of composition, and a totally different sort of acquaintance with the masterpieces of musical composition to any I possess or indeed am able to secure, for we seldom hear anything of a definite or conclusive character on this head either from

musical experts or practical musicians, from the latter, only too frequently men of very average intelligence, least of all. And we may further observe that it is a characteristic of the art of music itself, that we should find the task of presenting and expounding particular detail in general terms a less easy matter than in the case of the other arts. It is true enough that music, as other arts, deals essentially with a spiritual content, and propounds the ideality of this subject-matter, or the ideal movements of emotional life, as the object of its expression: yet for all that this content remains more indefinite in outline and more vague, for just this very reason that it is apprehended with exclusive regard to its ideality, or is reflected in sound as subjective feeling; and the transitional states of music are not in each case at the same time the change of a particular emotion or idea, a thought or an individual form, but are merely a musical progression, which consists in self-exposition or play, and avails itself of artistic method for this purpose. I will consequently limit myself merely to the following general observations, which have fallen in my way and strike me as of interest.

(α) From a certain point of view, no doubt, melody, in its free disclosure of musical tone, floats independent of beat, rhythm, and harmony; but none the less the only means employed in its realization are just these rhythmical and metrically constructed movements of tone in their essentially necessary relations. The movement of melody, therefore, is inseparable from the means employed to create it, and, if merely opposed to the practical necessity of the subjection of these means to rule, is unable to exist at all. In this intimate association between melody and harmony, however, no real surrender of freedom is involved: what melody is thus emancipated from is a purely capricious fancy of the composer exercised in odd or eccentric progressions and transitions. It is united by this very association to a stable and self-consistent art. Genuine liberty is not opposed to the principle of

necessity as a foreign and therefore oppressive and suppressive power; rather it possesses in the substantive character of the same what is a constituent of and identical with the core of its being; in following the demands of it it therefore is only conforming to its own laws, acting in accordance with its own nature. And in fact it is by the rejection of such proscriptions and only then that it proves an alien to its nature, untrue to itself. Conversely, it is sufficiently obvious that beat, rhythm, and harmony are, taken independently, merely abstractions, which as thus isolated have no musical[457] significance, and are able only to acquire real existence as music in virtue of melody, and as within the domain of this, supplying moments to or aspects in its realization. It is precisely in the manner that the distinction between melody and harmony is thus effectively mediated and resolved that the secret power of great compositions is disclosed.

(*β*)*Secondly*, in this question of the *individual* character of melody the following points appear to me of importance.

(*αα*) In the *first* place, melody may be restricted, if we consider its harmonious progression, to a very simple compass of chords and keys, extended within the embrace of tone-relations destitute of all opposition in their harmonious fusion, which it employs merely as the fundamental ground on which to develop its more appropriate form and movement. Song melodies, for instance, which be it understood are not on that account in the least superficial, but may express the depths of soul-life, as a rule are motived by constructive harmony of this most simple character. They do not propound the more difficult problems of chords and keys in so far as they deal with such things and their modulation at all. They are mainly satisfied with obtaining a simple harmonious accompaniment, which is not carried to the point of serious opposition, and consequently requires few resolutions in order to recover the final impression of unity. Such a mode of composition no doubt may lead to superficial results, such as we find in a great many

modern Italian and French melodies. In such cases the development of the harmony is entirely superficial. The composer endeavours to substitute for the genuine demand of his work in this aspect of it a merely piquant charm of rhythm or flavour of some kind. Generally speaking, none the less the emptiness of a melody is not the inevitable result of a simple harmonic basis.

(*ββ*) A further distinction consists in this that melody in the case supposed is no longer developed, as in our previous example, merely in the exposition of separate notes composed upon a relatively independent harmonic progression, regarded simply as the base of it: in the melody now under consideration every separate note of the melody is substantially complete as a concrete whole In a chord. In this manner it, on the one hand, includes a world of tones, and from another it is so closely interwoven with the movement of the harmony, that it is now impossible to retain the distinction previously accepted between a melody unfolded in relative independence, and a harmony which supplies the emphatic pauses of the accompaniment and its more fixed and determinate musical basis. Harmony and melody are here one and the same compact whole, and a modification of the one implies a correspondent and necessary alteration of the other[458]. This may be pre-eminently illustrated by chorales written in four parts. In like manner the same melody can be so interwoven in the varied vocal expression of its parts, that this interlacery itself creates a harmonic progression; or we may have different melodies in a similar way elaborated harmonically in association, so that the union of particular notes of these melodies produces musical harmony. We often, for example, meet with this in the compositions of Sebastian Bach. In such cases the music progresses by means of parts that vary greatly from one another in their character and movement, which appear to associate or inter-thread with each other on

independent lines, yet retain at the same time an essential harmonic relation to each other. A necessary and coherent union is thereby asserted.

(*γγ*) In composition of this kind it is not merely necessary for music which has any claim to profundity to be developed to the bare limits of undisturbed consonance, nay, even first to pass beyond it in order that it may return thereto: rather the first simple mode of concord will have to be rent asunder in dissonances. It is only through such conflict that the profounder combinations and mysteries of music in which an independent necessity reposes, discovers their source and ground; and for the same reason it is only in such profounder harmonic progressions that the arresting moments of melody originate. A bold style of musical composition will consequently part company with a purely consonant progression. It will pass into the sphere of opposing forces, will summon to its aid the most discordant contrasts, and disclose its unique power amid the tumult of all the resources of harmony, the conflicts of which it is equally able to calm, wholly confident in its ability to celebrate finally the grateful triumph of melodic tranquillity. We have in short here a battle waged between freedom and necessity; a conflict between the freedom of inventive genius, seeking to yield itself to its upward flight, and the necessary constraint of those harmonic conditions, which it is forced to acknowledge as the means of its expression, and in which its own ideal significance is reflected. On the other hand if the harmony, the employment, that is, of all its resources, the unrelenting nature of its conflict in the disposal of them and in its attitude to them is the main interest, the composition may very easily become heavy and overweighted with science, in so far at least as the freedom of movement is really impaired, or at least we are not allowed to feel the complete effect of its triumph.

(*γ*) To put the matter in other words, in every genuine melody a truly melodic, songful impulse, which is its essential type as music, must declare

itself as predominant and independent, as something which it neither forgets nor loses in the plenitude of its expression. Thus regarded melody presents, no doubt, an infinite power of adaptation and co-ordination in the progressive motion of tones, but the mode or form of this must be such that throughout we are made aware of an essentially complete and self-subsistent whole. This totality contains, it is true, a varied complexity, and implies in itself a forward advance; but it must for all that, regarded as a whole, be beyond all doubt rounded off and secure. It must therefore have a distinct beginning and termination to the extent at least that the intermediate part of it may be simply presented as the mediating link between that beginning and end. Only as such a movement, asserted with unmistakable emphasis, itself self-differentiated and returning on its own unity, does the melody of music reflect the free self-consciousness[459] of soul-life, whose expression it ought to be; only as thus perfected can music, in its own peculiar medium of ideality, enforce expression in its pure immediacy, or avail itself of the ideal freedom of that mode of expression which is the untarnished reflection of the inner life, an expression which, despite its subordination to the necessary laws of harmony, enables the soul to perceive a more exalted vision.

3. THE RELATION BETWEEN MEANS OF EXPRESSION IN MUSIC AND ITS CONTENT

After passing in review the general nature of musical art we considered the particular aspects according to which notes and their duration in time secured their necessary form. Having now arrived in our discussion of melody at the confines of a world of free artistic invention and actual musical composition, what we have now to deal with is a *content*, which, under its rhythm, harmony, and melody, is capable of receiving an expression conformable to art's requirements. After fixing clearly in our

minds general modes of this expression we shall as our conclusion be in an advantageous position to review the different provinces of musical composition. With these objects before us we may in the first instance advert to the following important distinction.

On the one side music may be, as already observed, in the nature of an *accompaniment.* This is the case where its spiritual content is not merely seized in the abstract ideality of its significance, or as individual emotion, but enters into the movement of the music subordinate to the significance it has already received from idea and words. As a type of music opposed to this we have the composition which is disconnected with any such content already prepared for it; music in this case establishes itself in its own proper sphere, so that it either, if it still is forced to deal with a definitely received content, resolves the same wholly in melodies and their harmonic development, or asserts its *absolute independence* in the medium of musical tone simply and its harmonic or melodic configuration. We have already seen that a similar distinction is apparent in a wholly different section of our inquiry. I refer to the case of architecture considered either as an independent art, or in the service it renders to that of building generally. But in music the mode of its accompaniment is of an essentially freer type than that of our illustration; it is far more intimately united with its content than is ever possible in the case of architecture.

In the actual domain of art this distinction marks the difference between *vocal* and *instrumental* music. We are not, however, entitled to accept it in the purely external interpretation of it, as though in vocal music it was merely the sound of the human voice, while in instrumental music it was the more varied tones of the many distinct instruments which were made serviceable. We must not in other words overlook the fact that the voice expresses at the same time in its song deliberate speech, presenting us the ideas of a specific content, so that music, regarded as the *word that is sung*,

if the twofold aspect of the same in tone and human speech is not to fall into a condition of indifference or absence of relation, is obviously bound, so far as the art enables it to do so, to supply its musical expression to this *content*, which as such *content* is brought before the receptive faculties in its nearest approach to definition, and no longer is left unrelated in more indefinite feeling. In so far, however, as the presented content, as libretto, is, despite of the above union, independently ascertainable in legible form, and is also consequently distinguishable in the mind itself from its musical expression, to this extent the music attached to a libretto is an *accompaniment*, whereas in sculpture and painting the unfolded content does not already attain to any presentment independently of its artistic form. At the same time we must be careful not to go to the other extreme and entertain an idea of such accompaniment, as though its entire purpose were one solely of subordination; the truth is precisely the reverse. The libretto is written in the interest of the music, and has no further importance save in so far as it brings home to the mind a more intimate knowledge of the actual subject the artist has selected for his work. Music maintains this freedom pre-eminently by virtue of the fact that it does not apprehend the content in the manner the libretto may be assumed to make it intelligible. Rather it exhibits its mastery of a medium, to which sense-perception and imaginative idea do not belong[460]. In this respect I have already, when discussing the general characteristics of music, pointed out that music expresses the principle of ideality in its intrinsic quality. The ideality of soul-life, however, may be of a *twofold* type. That is to say, to accept an object in its *ideal presentation*[461] may, in the first place, mean that we do not conceive it in its actual appearance in the phenomenal world, but relatively to its *ideal significance.* We may, however, mean by this, secondly, that a content is expressed as we find it realized in the experience of personal

emotion. Both forms of idealization are represented in the art of music. I will therefore endeavour to explain in more detail how this comes about.

In old church music, take the movement of a *crucifixus est* for example, we find that the profound meanings unfolded in the central idea of the Passion regarded as Christ's suffering, death, and burial, are severally so conceived, that it is not simply one merely *personal* feeling of sympathy or individual pain over these facts that is expressed, but along with this the very facts themselves, or in other words the depth of their significance is motived by the harmony of the music and its melodic progression. It is, of course, true that even here the impression is one which acts upon the emotion of those who hear it. We do not actually *perceive* the pain of the crucified, we do not merely receive a general *idea* of it; the aim is throughout that we experience in the depths of our being the ideal substance of this death and this divine suffering, that we absorb with heart and soul its reality, so that it becomes as it were a part of ourselves, permeating our entire conscious life to the exclusion of everything else. And in like manner must the soul of the composer, if his work is to disclose such a power of impress upon others, entirely lose itself in these facts and only in them. It must not merely have experienced a personal emotion of them. It must accept as its aim the task of making in its music the facts themselves live again for the ideal sense.

Conversely, I may read a text, a libretto, which narrates an event, places before me an action, gives to feelings the impress of speech, and thereby become moved even to tears in my profoundest being. This effect of *personal* emotion, which may attend all human action and conduct, every expression of inner life, and further may be excited by the perception of every such event and by participation in the presentment of such, the art of music is able to regulate; by so doing it ameliorates, tranquilizes and

idealizes by its influence the fellow-feeling in the listener who finds himself attuned to it. In both cases, therefore, the content rings through the inner life, in which music, for the very reason that it subdues consciousness in the simple attitude of rapt attention[462], is able to restrain the unfettered range of thought, imagination, sensation, and passage beyond the true boundary-line of the subject on hand. Music, in short, keeps the soul absorbed in a particular content, fructifies its energy therein, and moves and fills the life of feeling up to the brim within these limits.

Such is our conception and description, so far as the present occasion permits, of the manner of which music, as an accompaniment, when dealing with a definite content which is, as previously explained, set before it by means of a libretto, elaborates that aspect of it we have termed ideality. Inasmuch, however, as music is pre-eminently called up to do this in vocal music, and the human voice is added to this associated with instruments, it is customary to speak of instrumental music in a special sense as the music of accompaniment. It is no doubt true that it accompanies the voice, and should not either assert unqualified independence or claim an unqualified precedency. But for all that vocal music is placed, as thus associated, in a more direct relation still under the definition previously given of an accompanying tone. The voice expresses words articulate to the mind; and song is merely a fresh or additional modification of the content of these words, or in other words it is the explication of them in the language of the emotions. In the case of instrumental music, if taken by itself, the expression of imaged idea vanishes, and such music must necessarily confine itself to the means and modes of purely musical expression[463].

The discussion of these points suggests a *third* one, which, in conclusion, it is well not to overlook. I have previously drawn attention to the fact that the reality of a musical composition, in its full and vital embodiment, depends on a continually repeated reproduction. In this respect it is at a

disadvantage as compared with sculpture and painting. The sculptor, no less than the painter, conceives a given work and executes it throughout. The entire artistic activity implied therein is centred in one single individual, and by this means absolute reciprocity between the creative idea and its execution is secured. The architect, on the contrary, is in a less favourable position, who, in carrying through all the variety of structure in a building, has to entrust such work to other hands than his own. The composer in a similar way, must leave the execution of his work to other hands and voices. But in his case there is this difference, that the execution, from the point of view of mere technique, no less than that of the vital spirit of his work, itself demands an artistic activity, not one of mere craftsmanship. In this respect we may in our own time, no less than previously in that of the older Italian opera, whereas in other arts there has been little or nothing fresh of the kind, point to a marvellous advance in two respects in music. The first is to be noted in the conception, the second in the increased virtuosity of execution. It is due to these results the very notion of what music implies and is able to perform has, even in the case of acknowledged experts, been increasingly enlarged[464].

We may now briefly summarize the heads of the concluding sections of this portion of our work.

First, we shall investigate more carefully music regarded as *accompaniment*, and raise the question with what modes of expression in a given content it is as a rule most compatible.

Secondly, it will be necessary to consider this question more closely as viewed in relation to musical composition that is *exclusively independent.*

Thirdly, our conclusion will be reached with a few observations upon artistic *execution.*

(*a*) *Music as Accompaniment*

It follows, as a necessary result of what I have already described as being the relative position of libretto and music, that, in this sphere of its activity, musical expression is compelled to concern itself far more exclusively with a defined content than in the alternative case where it is able to surrender itself without restraint to its own movement and inspiration. A libretto offers us to start with definite ideas, and compels the attention to forsake that field of more visionary emotion destitute of distinct idea, in which we are permitted to range without interruption, and are not forced to abandon our licence to receive from pure music whatever chance impression or wave of emotion it may arouse. In this act of artistic interlacery with words, however, it is not right that music should carry its loyalty so far as to impair the free course of its progressions, even though it do so with the object of emphasizing the full character of what is contained in the libretto. To do this is to employ the mere pedantry of learning, to adapt means of musical expression for the most faithful presentment possible of a content which is not in the first instance its own, but supplied it externally. It is to accept this artificial result rather than the creation of a real self-subsistent work of art. And to that extent we have here evidenced a definite check and hindrance to free artistic activity. It is equally wrong in the opposite extreme that music should, as is almost invariably the fashion with modern Italian composers, wholly emancipate itself from the contents of the libretto, as though its specific character were only a bond, and with no other aim than that of approaching independent music as closely as possible. The true function of such music is this. It ought to steep itself in the meaning of the expressed words, situation, or action, and by virtue of such impregnation, ideally conceived, discover therefrom a vitally arresting expression, and elaborate the same in terms congenial to art. That is the course followed by all great masters. They appropriate everything of vital interest in the words; but the stream of their music, the tranquil flow of the composition, remains for all

that as free as ever. We acknowledge the natural growth of the music no less than its affinity to the text it illustrates. We would draw attention to *three* distinct types of expression all illustrative of this free spirit.

(*α*) To start with, there is that aspect of musical expression which we may describe as the truly *melodic*. We have here simply emotion, the utterance of soul itself, which, apart from anything else, finds self-enjoyment in such expression.

(*αα*) The domain here, in which the composer moves, is coincident with the human heart and the moods of the soul; and melody, which is the pure musical utterance of this inward world, is in the most profound sense the soul of music. Musical tone only attains to expression that is really vital when emotion is embodied in it or reflected in sound from it. Connected with this the purely natural cry of feeling, whatever it may be, of horror, for example, or the sobbing of grief, or the exclamation or outburst of uncontrolled jubilation, are themselves highly expressive; and indeed I have already referred to them as the starting-point of music, subject of course to the statement that art is unable to accept them under the mode of purely natural utterance. Here, too, we find a distinction between music and painting. The art of painting is frequently able to produce the most beautiful and artistic effect by its realization in every respect of the actual form, the colour and animation of a particular human being in some definite situation and environment, and its complete reflection of all that it has thus assimilated and received in its bare vitality. The truth of Nature, if presented conformably to artistic truth, is here entirely justified. But the art of music ought not thus to repeat emotional expression in the form it assumes as a purely natural utterance of passion; what it should do is to vitalize with the emotional forces musical sound elaborated under the definite conditions of its tonal progression, and to this extent resolve the expression in a medium of sound wholly created by art and inseparable from the artistic purpose, a

medium in which the mere cry becomes a series of musical tones with a definite progression, the transitions and course of which are subject to the laws of harmony and unfolded in the completeness of a melodic phrase.

(*ββ*) The essential significance of this melodic quality and its bearing on the human spirit is best apprehended if we view the latter as a whole. The fine arts of sculpture and painting give an objective existence to the ideality of soul-life; moreover, they liberate the mind from this externality of their presentation in so far as, from a certain point of view, it discovers itself therein as an ideal, spiritual work, and from another everything which partakes of adventitious singularity[465], of capricious idea, opinion, and reflection, is rejected, the content thereof being placed before us in its entirely appropriate individuality. The art of music, on the contrary, as we have repeatedly pointed out, possesses as a means to such objectivity merely the element of the soul-life itself, by means of which that which purely belongs to this enters into conversation with itself, and as expressed in the utterance of emotion itself returns, as it were, upon itself. Music is spirit or soul, which ring forth in their untrammelled immediacy, and derive satisfaction in this record of their self-knowledge. As a fine art, however, it is its necessary function to regulate the expression of such life no less than its effects. It ought not to permit that expression to be whirled away in bacchantic thunder and tumult, or be left in the distraction of despair, but retain the blessed freedom of its deliverance in the extremity of sorrow no less than the jubilant outburst of delight. And this is the character of truly ideal music, the utterance of melody such as we find it in Palestrina, Durante, Lotti, Pergolese, Glück, Haydn, and Mozart. Tranquillity of soul is never lost in the compositions of these masters. Grief is no doubt often expressed, but the resolution is always there; the luminous sense of proportion never breaks down in extremes: everything finds its due place knit together in the whole; joy is never suffered to degenerate into unseemly

uproar and even lamentation carries with it the most benign repose. I have already, when discussing Italian painting, emphasized the fact, that a spirit of reconciliation is not wanting even in extreme examples of sorrow and distraction of soul; by virtue of this, even where we have tears and suffering, some trait of tranquillity and assurance is preserved; the tenderness and grace which assert themselves in the harlequin's rôle illustrates the same truth. In like manner a feeling for nature and the endowment of musical expression is pre-eminently a characteristic of the Italians. In their earlier church music we find that, along with the deepest devotional feeling, the sense of reconciliation is expressed in its purity; and though grief may stir the soul most profoundly, yet beauty and rapturous joy, the simple greatness and impress of an imagination which discovers delight in its own varied expatiation, is equally present. It is a beauty of an apparently sensuous type, so that it is not unusual to refer to such melodious contentment as a purely sensuous enjoyment. But it is sometimes overlooked that it is precisely in this realm of the senses that art discovers its life and movement, and thereby transfers Spirit to a sphere in which, as in the world of Nature, this essential wave of self-satisfaction is throughout the fundamental tone.

(*γγ*) Albeit, therefore, *particularity* of emotional content must be duly represented, yet it is right that music, while permitting passion and imagination to stream forth in its harmonies, should at the same time lift the soul that is absorbed in such emotion over the same, enable it to hover around such content, and in short create an atmosphere wherein the recovery from such an absorption, and the pure reflection of itself is possible. This it is which gives us in fact the really melodious character to song-music. The important feature of it is not merely the progression of determinate emotion such as we indicate by the words love, yearning, jollity, and so forth; it is rather that inward sense, which presides over it,

which expatiates in its suffering no less than its delight, and finds satisfaction in doing so. Precisely as the bird in the brake, the lark on high sings its glad and touching song for the mere sake of singing, an outburst of Nature herself, having no further thought or intention whatever, it is just the same with human song and the expression of its melody. Consistently with this not infrequently Italian music, in which this truth is pre-eminently emphasized, will, just as poetry will, pass into mere melodious sound simply, and can readily appear to part company with the emotional stimulus and its particular mode of expression, or even in fact do so, for the very good reason that its object is the enjoyment of art by itself, and the contentment of all who thus are able to enjoy themselves. And apart from the Italians this is more or less the characteristic of all right melody. The specific nature of the expression, albeit present also, passes away, in so far as our hearts are absorbed in what we appropriate rather as our own, than in that which belongs to another, a something beyond us. By reason of this and this alone — it is much as we receive the impression of pure light — we are admitted to the most intimate conception of ideal blessedness and attuned spirits.

(*β*) In the art of sculpture the predominant impression is ideal beauty or self-repose. Painting, on the other hand, already presents a movement in the direction of specific characterization, and the emphasis it attaches to articulate expression is an essential feature of its executive purpose. In a similar fashion the art of music is unable to rest satisfied with melodious expression as above indicated. The purely emotional grasp by the soul of its intrinsic nature, and the play in musical sound of this apprehension is, regarded as the mere atonement of mood, when we take it strictly, too general and abstract. It is inseparable from the danger not merely of an alienation from the more careful interpretation of the content expressed in the libretto, but of that of becoming generally empty and trivial. If sorrow,

joy, yearning, and so forth are to find adequate reflection in melody, the soul that is actual and concrete only comes by such emotions in the downright reality of the same as involved in a veritable content, that is, in particular situations, events, actions, and so on. If, for example, a song arouses the emotion of mourning, the lament at a loss, we inevitably ask ourselves, what is the nature of that loss. Is it, shall we say, the loss of life with all its many interests? Is it a loss of youth, happiness, wife, beloved, children, friends, or anything else? For this reason it is further incumbent upon music that it should of itself differentiate in like manner its mode of expression when dealing with a *specific* content and the *various relations* and situations, which the soul has experienced, and the more ideal or intimate life of which it seeks to reflect in its harmonies. Music in short is not primarily concerned with the bare form of the inward soul, but with that innermost life as replenished, the specific content of which is most closely related to the particular character of the emotion roused, so that the mode of the expression will, or should, inevitably assert itself with essential differences, according to the varied nature of the content. In a similar way the soul, precisely in the degree that it takes a headlong plunge into any distracting experience, proceeds through an accumulating series of effects, and, in opposition to our previously described state of benign self-contentment, passes through conflicts and distraction, wrestlings with passions, and in short reaches an extreme of division, for which the mode of expression hitherto observed is no longer adequate.

Now what we mean by the detail of the content is just that which is supplied by the *libretto* or words. In the case of a simple melody, which is less concerned with this specific character, the more defined characteristics of the *libretto* are appreciably of less importance. A song, for instance, although it essentially implies as a poem and text a whole of variedly motived moods, perceptions, and ideas, none the less as a rule asserts

throughout one fundamental progression of emotion; it is primarily one chord of the soul that it emphasizes. To grasp this, and to reflect the same in the language of music, this is what such song-melody is mainly called upon to do. Consequently we may have identically the same music through all the verses of our poem, although the meaning they carry admits of much variety; and what is more, this very repetition, so far from proving injurious to the effect, may serve to enforce and enhance it. We may see the same thing in a landscape, where, too, the most varied objects confront the vision, and yet for all that the prevailing mood and aspect of Nature, which animates the whole, is one and the same. It is just such a prevailing tone that ought to assert itself in the song, and this, though it only applies strictly to some of the verses, but does not so apply to others; and the reason of this is that here the specific sense of the words is not to be taken as of most importance. What comes first is the simple melody that floats freely over all variety of content. In the case of many compositions which infringe this principle, and which start every fresh verse with a novel melody, which not unfrequently varies from the preceding one in beat, rhythm, and even scale, it is quite impossible to understand why, if such essential modifications were really inevitable, the poem itself ought not to have been altered in metre, rhythm, and rhyme, through all its verses.

(*αα*) What is, however, appropriate for the song, which is a genuine melodious utterance of the soul, is not applicable to every kind of musical expression. It is necessary, therefore, to draw attention to a *further* aspect in contrast to pure melody as such, one of equal importance, and by virtue of which alone song is really brought into line with accompanying music. We find this in that mode of expression which is dominant in the *recitative.* Here we have no independently exclusive melody, which at the same time reflects the fundamental mood of the content, in the elaboration of which soul-life, as at home with itself, receives back in musical sound some

portion of its ideal activity; rather in the case before us the content of the words, to the full compass of its specific character, is imprinted upon the musical expression, the import of which no less than the course it determines; and this is so whether we regard it from the point of view of the elevation or profundity which distinguishes it, or the prominence or subordination of its particular features. By such means music, as contrasted with melodic expression, approximates to an emphatic declamation, one accurately corresponding with the movement of the words, whether the view we take of them be that of their meaning, or that of their syntactical arrangement. And in so far as it adds also, as a novel element, the aspect of a more exalted emotion, it stands midway between the pure melody and poetical speech. Conformably to such a station, therefore, we have a free accentuation, which adheres strenuously to the specific sense of particular words. Moreover it is not necessary for the libretto in this case to be written in any particular metre, nor need the musical exposition, as the pure melody does in a like case, follow beat and rhythm with absolute precision; rather the music under this condition of it, that is in its acceleration, suspension, or pause in particular progressions, or rapid passage over such, is entitled to adapt itself freely to the emotion aroused by the meaning of the words. For the same reason the modulation is not so restricted as in the case of melody. Precisely as the text which it attempts to express may suggest, it may begin, proceed, pause, break off, begin again, or stop with absolute licence. Unexpected accents, progressions only partially mediated, sudden transitions and resolutions are equally permissible; and, in direct contrast to the continuous stream of melodious music, provided always that the libretto's content requires it, this latter mode of expression is equally in its place, though delivered in fragments, and torn asunder by passionate emotion.

(*ββ*) Being of this character this form of declamatory expression, known as recitative, is suitable for tranquil statement of situation, or facts, no less than the presentment of the entire compass of the emotions, under which the distraction of the soul in exceptional circumstances is depicted, and which in its soul-full harmonies stirs the heart sympathetically with its every movement. The recitative is first mainly applicable to the oratorio, either as the declamed narration, or the more vivacious presentment of instantaneous occurrence; or, secondly, we find it in dramatic song, in which case it can appropriately express every shade of parenthetical statement, no less than every sort of passion, it matters not whether the result be expressed in abrupt, curtailed, or fragmentary variation, or with aphoristic violence, or in a dialogue of rapid lightning flashes and counter flashes, or in a more continuous stream. In both these provinces of epic or dramatic poetry, we may add that instrumental music is a possible accompaniment. Its function in either case is either quite simply to emphasize the pauses in the harmonic progression, or to interrupt the course of melody with incidental music, which, agreeably to the general import of the former, depicts in musical language other aspects and movements of the situation.

(*γγ*) What, however, we find defective in this declamatory recitative is just the qualities which are essentially characteristic of the pure melody; these are the definite articulation and unification of its parts, the expression of that spiritual homogeneity or unity of which we have spoken, that which, it is true, is confined in a particular content, but at the same time asserts its own sense of unity in that content, being enabled to do this through its refusal to be distracted or broken up by its absorption in particular aspects of it, or rather, instead of this, still retaining in them as predominant its ideal coalescence. For this reason the art of music cannot rest satisfied, even where we are dealing with the more sharply defined features of the libretto proposed, with such recitative of declamation; nor in general can it remain

content with the unmediated *difference* between the pure melody, which, in comparison with it and as above explained, floats over the particularity of the words, and the recitative, whose task it is so far as possible to identify itself with it. On the contrary we must look for some mode of *mediation* between these extremes. We may compare with this new type of unity a constituent which entered into our consideration of the distinction between harmony and melody. This harmony was acknowledged as being not merely the general, but to a like extent the essentially specific and particularized foundation of melody; and far from the latter being thereby deprived of its freedom of movement, we found that it only thus secured for the same a power and definition comparable to that the human organism secures by virtue of its consistent bone-structure, which only impedes inappropriate postures and movements, while it adds stability and security to the right ones.

This brings us to the final point of view of our discussion of music as an accompaniment.

(*γ*) This *third* mode of expression consists in this that the melodic song, which accompanies words, is also involved in their particularized substance, and thereby is not permitted to remain wholly indifferent to the principle of most force in recitative; rather it appropriates this with the result that while it repairs its own defects in clear definition, it confers on the characteristic recitative an organic articulation and a unified self-consistency. For, as already observed, even that which is throughout melody is impossible without a certain defined content. When, therefore, I mainly emphasized the fact that in all and every mode of it the tranquil self-reflection of the soul's own essential substance and ideal unity is the mode of expression peculiarly that of simple melody, inasmuch as, musically considered, it presents a similar unity and a similarly complete return upon itself, I did so because I then had in view this aspect as the distinctive point

of contrast between the pure melody and the recitative. It is, however, further incumbent on the melodic phrase to bring it about that its mode come into actual possession of that which in the first instance appears necessarily to have its movement outside it, and by means of this replenishment, in so far as it then is equally of a declamatory or a melodic character, for the first time attain to a truly concrete expression. It follows also from the converse point of view that the declamatory part of it is no longer independently aloof from it, but finds its own one-sidedness supplemented in like manner by the accretion of melodic expression. This is what constitutes the necessary condition of such concrete unity. In order to examine this more closely we had better keep distinct the following points of view.

First, it will be as well to glance at the kind of *libretto*, or text, which is adapted to musical composition, and for this reason that it has been now proved that clear definition in the content of words adapted to music and its expression is of essential importance.

Secondly, we have now introduced as a fresh constituent of *composition* declamatory characterization; it will therefore be necessary to consider this in its relation to the principle, which we, in the first instance, identified as that of melody.

Thirdly, we must endeavour to specify the more prominent *modes* under which we may review this type of musical expression.

(*αα*) Music[466] is not merely in a general way an accompaniment of the content of a work in a sphere which already engages our attention, but it is part of its function, as already observed, to define still further the characterization of such a work. It is consequently an injurious assumption that the construction of the libretto is a matter of indifference to the musical composition. We find, on the contrary, that really distinguished musical compositions presuppose an excellent libretto, carefully selected by the

composers or actually written by them. It is impossible that an artist should treat with indifference the material with which he is dealing and a musician least of all, precisely in the degree that poetry has already worked out and settled for him the epic, lyrical, or dramatic configuration of the content in question.

What is of first importance in the construction of a good text is this that its content should be stamped by essential *self-consistency.*[467] It is impossible that music should conjure forth an artistic product of real strength and penetration from what is commonplace, trivial, barren, or absurd. With all the spices and seasonings in the world your musical chef will never make a hare pie out of a roasted cat. In the case of song compositions no doubt the nature of the words is less decisive, yet even here we require words with a really genuine content. From a further point of view, however, it is equally necessary that such a content should not tax our reflection too much, or aspire to philosophical profundity, as is rather the case with the lyrics of Schiller. In such an example the extraordinary range of pathos exceeds the musical expression of lyrical emotion. The same thing may be said of the choruses of Aeschylus and Sophocles. The penetrative power here displayed in imaginative conception is so exceptional, they are so elaborate in their detail whether regarded in their scenic or ideal presentment, they are already so absolutely complete as poetry that we have nothing left for music to add to them[468]. We have literally no room left us for any further play or exposition of ideal significance or movement beyond that already presented. The more modern material and mode of treatment we find in the so-called romantic poetry are in their type the strongest contrast to these. Their pretension, as a rule, is that of being naive and popular; but we only too frequently find a *naïveté* which is finical, artificial, and stilted. Instead of pure and genuine emotions we get a *simplicitas* that is nothing but feeling worked upon and acting under the constraint of

reflection; a false kind of yearning and affectation, which is far too complaisant with dulness, stupidity, and vulgarity, and is equally blind to the defects of passions, envy, licence, and even devilish wickedness wholly without ideal content; which is, moreover, as self-satisfied with its assumed excellence in the one case as it is with the dissolution and baseness of the other. Emotion that is spontaneous, simple, thorough, penetrative, is here entirely absent, and music, in any attempt to reproduce it, can suffer no greater injury. We may therefore accept the fact that neither mere depth of thought, nor the vanity or worthlessness of mere emotion can give us a satisfactory content. On the contrary what is most adapted for music is a certain intermediate type of poetry, which we Germans are loth even to admit as poetry, and the true feeling and talent for which is more largely possessed by Italians and Frenchmen. It is a poetry of a genuine lyrical quality, extremely simple, which indicates situations and emotions in a few words. Where it is more dramatic it remains luminous and vital without too involved a development; detail is not so much elaborated, but it is rather, as a rule, concerned to supply general effects, than the completely articulate results of a poet's activity. We find here that the composer receives, in accordance with his demand, merely the general foundation, upon which he can, in subordination to his own invention, and his own threshing out of motives of every kind, erect his building, treating many aspects of the subject as part of his own life and movement. For inasmuch as music has to adapt itself to words, these words should not particularize the picture too closely; if they do the musical declamation becomes absorbed in trifles, lacking in a common impulse, too contracted in the direction of particular features, and the unity and general effect is impaired. In this direction people are only too frequently at fault when expressing an opinion upon the excellence or insufficiency of a libretto. It is one of the most common verdicts, for example, that the libretto of the Magic Flute is hopelessly bad,

though this piece of manufacture is nevertheless among the best of opera librettos. Among the many wildly fantastic and commonplace productions of his pen Schickaneder has in this for once hit the right track. The empire of Night, with its queen, the empire of the Sun, these mysteries, these initiations, this Wisdom, Love, these ordeals, and with it all this typically world-wise ethic, excellent in the breadth of its applicability — all this when combined with the depth, the bewitching loveliness and soul of the music expands and floods our imagination, and warms the heart.

To mention further examples, the old Latin texts of great masses and other services are unrivalled for religious music. This is in part due to the fact that they set before us in the greatest simplicity and brevity the most general content of religious faith, in part also to this that they present in the same spirit the varied stages of emotion that accompany the substance of this in the consciousness of the community of the faithful, and by doing both offer the musician a wide field for his own particular development. The great Requiem and many selections from the Psalms are equally serviceable. In a similar way Handel welded his texts, partly from religious dogmas themselves, but, above all, from scriptural passages and situations of symbolical import, into a completely consistent whole.

In the field of lyrical poetry the more suitable for this purpose are the emotional and shorter poems, in particular the simple ones, in content no less than speech, steeped in emotion, which penetrate into one prevailing mood or affection, or those too of lighter and more gay character. There is hardly a nation that does not possess such. In the sphere of drama I will only mention Metastasio, and with him Marmontel the Frenchman, who, himself richly emotional, cultured, and lovable, instructed Piccini in French, and knew so wisely how to combine in the drama grace and vivacity with the skill and interest of the action and development. But before all else we shall do well to emphasize the libretti of the famous operas of Glück.

Without exception we shall find their motives simple. The content they offer to the emotions is in a sphere the most sterling of all, depicting as they do the love of mother, wife, sister, friendship, honour, and so forth, and permitting these simple motives and the form of their essential collisions to unfold in an atmosphere of tranquillity. And for this reason the passion they disclose is throughout pure, great, noble, and of plastic simplicity.

(*ββ*) It is, then, the function of music, by the characterization of its expression no less than its wealth of pure melody, fittingly to reproduce a content of the above nature. And that we may obtain such a result it is not merely necessary that the text contain in itself earnestness of heart, the comic and tragic greatness of human passion, the depth of religious idea and emotion, the powers and fatalities that the human breast discloses, the composer also on his part must be absorbed wholly in the composition, and must have lived in and through it heart and soul.

What is equally important is the relation under which what is characteristic and melodious in such music is on either hand associated. The main point appears to be, that as between them it is the melodic expression which without exception, as the factor of synthetic unity, which gains the day, rather than that which tends to distract and break up the whole into particular characterization. To take an example of the latter case from modern dramatic music, the effect often sought for here is one of powerful contrasts, and this is brought about by forcing into one continuous stream of music, under the conditions of conflict permitted to the art, contrasted passions. We have, it may be, expressed for us jollity, marriage, and festive associations, intermingled with which we may have hate, revenge, hostility, so that for result we are presented a fine uproar in which joviality, delight, dance-music, passionate scolding, and the very extremes of distraction are all involved. But contrasts of interrupted life such as these are, and which tumble us from one side to another, without any principle of union, are

opposed to harmonious beauty precisely in the degree that the point of opposition in such characterization is acutely emphasized, and any return of the melody to a real self-repose and self-enjoyment is out of the question. And in general the union of the melodic and characteristic features of such music readily incurs the risk of overstepping the finely drawn boundaries of musical beauty, more especially when the intention is to express force, selfishness, evil, impetuosity, and other extremes of exclusive passion of a similar nature. The moment that music is involved in its abstract task of such characteristic limitation it can hardly avoid making for chaos, becoming, that is to say, more acute, unpliable, and, in fact, thoroughly unmelodious and unmusical, to the extent even of sheer misuse of discord.

A similar result will be found if we look at the *different* features of characterization generally. I mean that if these are strongly emphasized in their independent form the connection between themselves and other traits is readily weakened and their self-subsistency in repose is at once evident: but in musical exposition our difficulty is, we have an essential movement throughout, and it is in this progression that we are forced to look for the relation of stability; this being so the isolation of effect cannot fail to act injuriously on the flow and unity of the music.

Genuine beauty in music consists, under the aspect now being discussed, in this, that while there is no doubt a movement towards characterization out of that which is simply melodic, yet within the sphere of this more defined articulation[469], the melodic aspect is still maintained as the sustaining soul and unity, much as we find in what is most characteristic in the paintings of Raphael the fundamental tone of beauty is throughout conserved. Melody is then not without definite significance, but in all such definition betrays a coalescing and suffusing principle of life, and more characteristic detail presents itself merely as the emphasized prominence of

certain aspects, which are none the less always and essentially fused again in this medium of unity and animation. To hit off the just mean in this respect is, however, a more difficult task for music than the other arts, for the reason that music surrenders itself more readily to such antagonistic modes of expression. For this reason criticism over musical composition is almost always divided into two camps. The one attaches most importance to the melodic structure, the other prefers further advance in characterization. Handel, for example, who frequently in his operas insisted on having certain lyrical episodes emphasized acutely, had to face many a tussle on this head with Italian singers, and was finally compelled, when the public ranged itself on the side of the Italians, to confine himself wholly to the composition of oratorios, in which field his genius pre-eminently asserted itself. In the time of Glück also the long and vehement controversy between the supporters of Glück and Piccini is famous. Rousseau also in his turn insisted on the superiority of the more melodious Italian music as compared with the deficiency in this respect of the earlier French composers. We have in our own days the same old controversy waged for or against Rossini and the more modern Italian school. The opponents of the former condemn his music as if it were so much empty ear-tickling; if we, however, assimilate his melodies more generously we shall find that there is much in this music of real feeling and genius; it is not without a real message to our faculties, although it does not make any claim to the characteristic effects, which are more especially dear to our severe German musical sense. And indeed it must be admitted that only too often Rossini says good-bye to his libretto, and gives free vent to his melodies, precisely as his mood dictates, so that we have nothing left us but the alternative either to stick to the subject-matter and grumble over the music that is indifferent to it, or abandon the former and take our hearty delight in the inspired irrelevances of the composer and the soul which they reveal[470].

(*γγ*) I will now in conclusion briefly summarize the most notable *forms* of music regarded as accompaniment.

First, in the order of our classification we may mention *ecclesiastical* music. Music of this type, in so far as it is not concerned with the personal emotion of individuals, but with the substantive content of emotion in its widest compass, or shall we say the universal emotion of the community viewed collectively, is in a large measure throughout of *epical* consistency, even though it instructs us in no events in so many words. How an artistic conception is able to be epical in significance, though we have in it no narrative of event, we shall endeavour to explain at a later stage when we come to deal more closely with epic poetry. This fundamentally religious music is among the profoundest and most impressive creations that Art can bring into being in any sphere whatever. Its true position, in so far, that is, as it is associated with the sacerdotal petition for the community, we find in the cult of *Roman Catholicism*, conjoint with the Mass, and more generally as a means of musical devotion attendant to the most varied ecclesiastical functions and festivals. Protestants can also boast of musicians of the profoundest gifts not merely as religious men, but also in the sterling character and opulence of their imaginative resource or executive ability. Sebastian Bach here stands before us as the master of masters. For the first time in our own day we have been taught to appreciate at something like its value the great genius of this man, his truly protestant, robust temper, and withal his profound erudition. Of first importance we may observe in this connection, and in contrast to the direction followed by the music of Catholicism, the emergence in complete form of the oratorio, in the first instance out of the Passion music. Nowadays, of course, music for Protestantism is no longer so closely associated with the cult of religion, nor so essentially a part of its services; and indeed it is often more a matter of exercise in musical scholarship than a really vital creation.

Second in order we have *lyrical* music, which expresses in melody isolated moods, and for the most part should be disjoined from the wholly characteristic or declamatory mode, although it may rightly undertake to combine with its expression the specific content of the words illustrated, whether their import be religious or otherwise.

Tempestuous passions, however, which neither issue in repose or finality, the unresolved division of the heart, emotional distraction destitute of all relief, such experiences are more suitably reproduced as an integral part of *dramatic* music; they are out of place in the harmonious consistency of the lyrical mode.

This *dramatic* form is then our *third* and final division. The tragedy of the ancients was associated with music; but this aspect was not emphasized, and for this reason that in truly poetical works precedence must necessarily be given to human speech and the poet's own exposition of ideas and emotion; the only way music could in these times assist — which in its harmonic and melodic expression had not as yet reached that of a subsequent Christian era — was mainly from the rhythmical point of view by heightening with increased animation the musical sound of the poetical language, and thereby bringing the same more home to the heart.

Dramatic music, however, receives a really independent position when once the form of church music is essentially complete, and in lyrical expression some degree of perfection has been attained. We find this in our modern operas and operettas. It must be admitted that from the point of view of song the *operetta* is a halfway house of less importance, one which mixes together with no vital connection speech and song, what is musical and unmusical, the language of prose and that of melody. It is a common objection no doubt that song in the drama is without exception unnatural. Such an objection cannot be pressed, and would be far less open to argument as against the opera, in which from the first line to the last every

idea, emotion, passion, and resolve is accompanied by and expressed in song. On the contrary, it is rather the operetta which still requires justification in so far as it introduces music in which we have a more animated presentment of the emotions and passions, or the latter are adapted for such presentment, while in the juxtaposition of a confused melody of prosaic dialogue with these artistically treated interludes of song we have what is a perpetual embarrassment. In other words, the emancipation of art is incomplete. In genuine *opera*, however, in which the action throughout receives its musical analogue, we are once and for all transported into an ideal world of art, the atmosphere of which is throughout the work maintained in so far as the music accepts for its fundamental content the ideal aspects of emotional stress, the particular phases of such in specific situations, and the conflicts of passion, that it may, by virtue of the more complete effects of its expression, add the final emphasis they would otherwise have lost. Conversely in the *vaudeville*, where airs already popular and well known are set to the more pointed and arresting rhymes, singing is merely a self-imposed kind of irony. The fact that there is singing at all is intended to be taken rather as parody or amusement: here the main point is the meaning of the text and its fun, and the singing has no sooner ceased than we laugh that it should ever have commenced.

(*b*) *Independent Music*

We may compare melody, as an essentially self-contained and self-supported whole, to plastic sculpture; in the more detailed characterization of painting we shall find an analogous type to that of musical declamation. And inasmuch as in the latter case we have an aggregate of specific differentia unfolded such as the more simple movement of the human voice is unable in all its variety to express, the more all these many aspects of life enter into the movement of the music, to that extent instrumental music is a necessary accompaniment. In addition to this, as a *farther* point of view,

whether in its relation to the music that accompanies a libretto, or the characteristic expression of the words, we have to recognize in its freedom a content of definite ideas, which is, as transmitted, wholly independent of musical sound.

Now what constitutes the essential principle of music is the ideality of the soul-life. But this innermost, or ideality of the concrete self is the subjective state in its bare simplicity, that is, as defined by no assured content, and for this reason not forced into motion either one way or another, but reposing on its unity in unfettered freedom. And if this subjective principle is to come entirely to its own in music also it must rid itself of a traditional text, and in all purity, out of its own resources, master its content, the movement and the kind of expression, the unity and development of its creation, the carrying out of a main conception, no less than all episodical or incidental matter; and in doing this, for the reason that the significance of the whole is not expressed in language, it must restrict its means to those exclusively of musical value. And this is what does take place in the sphere I have already described as *independent* music. Music, as an accompaniment, possesses that which it undertakes to express outside its own domain; to this extent it is associated in its expression with that which does not belong to it as music, but to an alien art, poetry. If music is to be nothing but music simply, it must disengage itself from this factor, which it has only borrowed elsewhere, detach itself absolutely from the definite substance of language. Thus alone it becomes entirely free. And this is the point we have now to examine more closely.

We have already noticed the beginnings of such an emancipation within the limits of music as an accompaniment. For though it is true that in part here music was compelled by the force of poetical language to be subservient, yet also in part it either moved in benign repose over the more *limited* characterization of the words or removed itself entirely from the

significance of ideas therein expressed, to expatiate of its free will in the musical language of joy or sorrow. The same result is apparent in its effect on an audience, the public as we say, and more especially in its attitude to the music of drama. In other words, an opera has many constituents. We have the local condition, landscape and the rest, or the movement of the action, or incidental episodes and pageants. From another point of view we are confronted with human passions and their expression. In short, there is a twofold content — namely, the external action and the soul-emotion that corresponds. If we take the action simply we shall find that, though it is that in which all the parts cohere, yet regarded merely in its movement forward it is less adapted to musical expression and mainly elaborated in recitative. With a content of this nature an audience is not so arrested; its attention is particularly liable to wander off from the dialogue of recitation, and to fix itself upon the portion of the work that is really musical and melodious. We have an exceptional illustration of this — I have already adverted to the fact — in our modern Italian opera, which is from the first made to fall in with the custom of the audience to engage in conversation, or other ways of enjoying itself, during the chatter or trivialities of the musical dialogue, and which only returns to that part of the music which is truly music, with the full measure of sympathetic attention, enjoyment, and delight. In this case we find, then, that composer, no less than audience, barely fall short of bidding good-bye to the libretto's substance altogether, and of treating music for the purposes of enjoyment as an absolutely independent art.

(*α*) The true province of such independence is, however, not the accompaniment of vocal music undeniably conditioned by a text, but instrumental music simply. As already observed, the human voice is the appropriate musical expression of man's inner life in its entirety, a life also expressed in ideas and words, which therefore discovers in its own voice and song its distinctive organ, so often as it seeks to express and recover

this inner world of its ideas permeated throughout with the concentrated intensity of emotion. In the case of instruments taken by themselves, however, this basis of an associated text of words disappears; here we find an opening for the empire of a music that is confined strictly to its own unassisted powers.

(*β*) Such a music of particular instruments presented us in quartets, quintets, sextets, symphonies and the like, without text or vocal music, remains unrelated to any movement of ideas independently asserted, and is for this very reason compelled to have recourse to emotions of a more indefinite character, emotions which in such music can only be expressed in general terms. The aspect of importance here, in short, is the varied motion of the music simply, the ups and downs of the harmony or melody, the stream of sound through its degrees of opposition, preponderance, emphasis, acuteness or vivacity, the elaboration of a melodic phrase in every respect that is suitable to the means of musical art, the musician-like fusion of all the instruments as one *ensemble* of tone, or in their succession, alternation, and emphatic display of themselves and each other. It is in this sphere pre-eminently that the distinction between the *ordinary person* and the *expert* of music asserts itself. The ordinary man likes best in music an expression of emotion and ideas that is at once intelligible, that whereof the content is obvious; his predilection is consequently for music under the mode of an accompaniment. The connoisseur, on the contrary, who is able to follow the relation of musical sounds and instruments as composition, enjoys the artistic result of harmonious modulation, and its interwoven melodies and transitions on its own merits. He is entirely absorbed by this alone, and is interested in comparing the detail to which he listens with the rules and principles he is fully able to apply to it, in order thus to follow the performance with judgment and delight, although even in his case it

frequently happens that our modern type of virtuosity, with variations in tempo or other nuances for which our connoisseur is unprepared, will perplex him not a little. A complete satisfaction of this kind comes rarely to the mere amateur. He is seized with the vain desire to master this apparently phantomnal process of music, to discover arresting points for his attention in the musical development, and generally more definite ideas and a more detailed content in the volume of sound that invades him. In this respect he seeks to attach to music a symbolical significance, yet can find in the same little beyond mysterious problems that vanish in the moment they are propounded, which baffle his powers of solution and in general are capable of a variety of interpretations.

The *composer* is able, it is true, on his part to associate with his work a definite significance, a content of specific ideas and emotions, which are expressed articulately in movement that excludes all else; conversely he can, in complete indifference to such a scheme, devote himself to musical structure simply and the assertion of his genius in such architectonic. Composition, however, of this character readily tends to become defective both in the range of its conception and emotional quality, and as a rule does not imply any profound cultivation of mind or taste in other respects. And by reason of the fact that such a content is not necessary, it frequently happens that the gift of musical composition not merely will show considerable development in very early age, but composers of eminence remain their life long men of the poorest and most impoverished intellectual faculty in other directions. More penetration of character may be assumed where the composer even in instrumental music is equally attentive to both aspects of composition; in other words, the expression of a content, if necessarily less defined than in our previous mode, no less than its musical structure, by which means it will be in his power at one time to emphasize

the melody, at another the depth and colour of the harmony, or finally to fuse each with the other.

(*γ*) We have throughout posited subjectivity in its unconstrained presentment within the limits of music as the general principle of this type of composition. This independence of a content already proposed to it from an alien source will, however, more or less assert itself in opposition to mere caprice, though the restrictions under which it admits it are not defined rigorously. For, albeit this type of composition has its own rules and modes, the authority of which no mere whim or fancy can reject, yet they are regulations which only affect the broader aspects of music; in actual detail there is no end to the opportunity which the inner content of soul-life[471], provided it once accepts the boundaries fixed by the essential conditions of musical composition, may discover for its otherwise free expatiation and exposition. And, in fact, as a result of the elaboration of modes congenial to this type, the caprice of individual composers asserts, in contrast to the steady advance of purely melodic expression and music in association with a definite text, a practically unrestrained mastery in every sort of conceit, caprice, interlude, inspiriting drollery, startling suspension, rapid transition, lightning flashes, extraordinary surprises and effects.

(*c*) *The Artist as Executant*

In sculpture and painting we have a work of art presented us as an external and independent *result* of artistic activity; we do not regard this activity itself as the actual creation of life[472]. It is, however, necessary to the presentation of a musical work of art that we should have an executant musician in co-operation, just as in dramatic poetry we have the representative presence of living manhood as an essential factor in this type of art's realization.

We have, then, reviewed musical composition under the two aspects, that is to say, in so far as it sought to conform with a specific content, or struck

out on its own free path of independence. We may now in the same way distinguish between two main types of purely executive art. The one is wholly absorbed in the work of art on hand, and makes no attempt to reproduce anything over and beyond this. The other, on the contrary, is not simply reproductive; it actually creates expression, delivery, in short the essential animation of the work, not merely from the composition as composed, but predominantly from its own resources.

(α) In the case of the epic poem, wherein the poet seeks to unfold an objective world of event and modes of action, the rhapsodist, who recites it, has no occasion to do anything further than wholly withdraw the expression of his own personality in the presence of the exploits and events he brings home to us. The more reserved he is in this respect the better; indeed such recitation is not incompatible with a monotoned and unemphasized delivery. What is effective here is the fact of the poem, the poetical execution, the narrative itself, not its realization in voice and speech. This illustration will suggest to us the *rationale* for our first type of musical reproduction. In other words, if the composition is in a similar way of a genuine objective quality, in the sense that the composer has simply translated his subject-matter, or the emotion that is absorbed with it, into musical language, the artistic reproduction should retain the same objective character. It is not merely true that here there is no reason for the executant to import into it his idiosyncrasies; by doing so he necessarily impairs the true artistic effect. He must subordinate himself entirely to the character of the work, and prescribe to himself simply this attitude of attention. On the other hand, he must not, as is too frequently the case, confuse such an attitude with that of the purely servile artisan, and lower himself to the level of an organ-grinder. If such execution is to retain any artistic claim the artist is bound to avoid leaving the impression of a musical automaton, which merely repeats its prescribed lesson mechanically, and instead to animate the entire work with the heart

and soul of the composer himself. The virtuosity of such a vital reproduction is restricted, however, to the just elucidation of the technical difficulties presented by the work, and in doing so the object will be not merely to cover any appearance of triumph over an exacting task, but to portray the freest movement under such conditions, and, in so far as superior artistic endowment and experience can in the particular case manage to do so, attain in the reproduction to the spiritual altitude of the composer and reflect the same in actual performance.

(*β*) It is another matter when we come to deal with works of art, in which personal idiosyncrasy and caprice are even by the composer himself features brought into prominence, and where generally we find the traces of such a clearly objective quality in expression, the treatment of the harmonic or characteristic development less pronounced. In such a case the *bravura* of virtuosity is, it is our first distinction, quite admissible; and over and above this executive ability is not only limited to the reproduction of the actual score, but may considerably amplify; an artist will *himself* add to the composition in his delivery, supplement defects, add substance to what is comparatively superficial, import into parts a new life, and in doing so assert independent judgment and invention. In the Italian opera, for example, much is always left to the singer's discretion; in particular where we have embellishments a more liberal opportunity of display is granted, and in so far as the exposition of sound is further removed from the mere interpretation of the libretto, the execution in its independence becomes a more spontaneous flow of melody, in which the soul of the singer is permitted to enjoy itself and exult in its own free rapture. When therefore it is objected that Rossini for one has made the singer's task too easy, the stricture is only in part justified. The difficulty is none the less there, only he frequently leaves it to the trained intelligence of the executant to work it out for himself. If in the result we are conscious of the co-operation of

genius, the work as thus reproduced makes an exceptionally favourable impression. We have not merely a *work of art* reproduced, but we are conscious at the same time of actual *musical creation.* In this very present realization of life the external conditions of artistic reproduction disappear, such as place, opportunity, the local associations of a divine service, the content and intent of a dramatical situation; we have no further need for, nor do we desire any text, we have left us simply the unspecialized impulse of emotion, in the element of which the soul of the artist can surrender itself without let or hindrance to its own rapture, displaying thereby inventive genius, the finest qualities of emotion, and a mastery of technique; and in fact, provided we find the right spirit, ability, and personal charm to justify it, it may venture to interrupt the flow of melody itself with humour, caprice and virtuosity, and accept for once the moods and suggestions of the moment.

(*γ*) This kind of virtuosity is yet more remarkable in cases where the instrument is not the human voice, but one of *human invention.* By this I mean to say that such naturally in the kind of sound they produce are further removed from the soul's direct expression; they are in relation to that of an external object, apiece of dead mechanism, and music is essentially a spiritual movement and activity. When we find, therefore, this externality of the instrument vanishes altogether, in the case, that is, where the music of the soul breaks right through this alien crust of mechanism, by means of such virtuosity, even an instrument of this character is transformed into one as fully adapted to express the soul of the artist as it is possible to conceive. Among the memories of my youth I can still recall the case of an astonishing executant on the guitar, who in his own eccentric fashion had composed huge battle-pieces for this comparatively insignificant instrument. By profession, if I remember rightly, he was a weaver, and in conversation he had little enough to say for himself. But no sooner did he

begin to play than one wholly forgot the absurd pretensions of his composition, forgot these precisely as he forgot all else but the music, and the marvellous result he made of it by being totally absorbed body and soul in his instrument, entirely witless of any form of nobler execution than that expressed in the tones of a guitar[473].

A virtuosity of this type, in so far as it asserts such a unique superiority, is not only a proof of extraordinary mastery over material forces, but we receive from it as it strides victoriously over difficulties apparently unplayable, even turns aside to add to them, or in wayward mood breaks in upon us jestingly with I know not what interruptions and surprises, and by original invention even makes us enjoy what would otherwise be vulgar, is a direct reflection of absolutely free soul-life[474]. It is quite true that a mere charlatan[475] of this type is unable to produce original works of art; but where real genius is part of the endowment we can have extraordinary mastery in composition no less than over a particular instrument, the limitations of which this virtuosity lays itself out to overcome, and in audacious vindication of its triumph will reproduce the artistic effects of other instruments entirely remote in other hands from its own. It is an accomplishment of this kind which delights us with our acutest sense of the life of music. And this riddle of riddles we discover in the fact that a mere piece of mechanical craft can become an instrument one with our life, which enables us to follow, as through a flash of lightning, a power of ideal conception no less than execution, by virtue of which the imagination of genius penetrates to the core of life as instantaneously as it vanishes therefrom.

Such, then, are the most essential features, which I have selected from my own experience of music, the more general points of view which I have detached from the subject and concentrated attention upon in the present discussion.

[377] *Ein festes Daseyn*, lit., an assured existence.

[378] We should not expect the plural. Hegel apparently includes the transitional relief of sculpture.

[379] Lit., "But also strives to set itself back into the previous condition." He refers to the mutual relation of tones.

[380] *In sich selbst Ideellgezetzte.* That is, posited as ideal in the way music does with its object, as to which further explanation is given below.

[381] It is difficult to follow closely this very technical interpretation of musical sound, and a doubt may be perhaps permitted as to whether it corresponds to the scientific facts. I mean it does not appear fully to do justice to the reaction of the organ of human hearing itself and the intelligence with which it is related upon the sound waves that through such mediation are cognized as musical sound. The ideality appears to me to be more complete than even Hegel's theory would suggest, or, at any rate, some of his expressions. And surely, too, in sight, though it may be true we see independent objects, we only do so, in so far as their secondary qualities are concerned, by virtue of a considerable action of what he here calls *Seelenhaftigkeit.* But this is not the place for more than a suggestion. The main points of contrast are in Hegel's interpretation sufficiently obvious.

[382] *Des Körpers.* I am not sure that I quite follow the meaning of this second moment of negation. If it means the reaction or synthetic process of human hearing it removes in great measure the objection above. We then have as the twofold negation the negation by the ideality of sound and that through the human sense. But owing to Hegel's use of *Material* to indicate the medium which is subject to oscillation, it would rather appear to mean that one vibration is cancelled by another.

[383] *Das an und für sich schon etwas Ideelleres ist.* This would correspond to the ideality of the first negation of spatial condition.

[384] He means its own ideal existence. *Aufgeben* must here be used in the primary sense of "delivers." He does not mean that it gives expression to the ideality of spirit; this is added by the next clause.

[385] This is, I think, Hegel's meaning for *das an sich selbst Subjektive.* Its content is also formally ideal or abstract as above explained, but to express this he would rather have used the word *ideell* or *innerlich.* It is also, as I have pointed out, in great measure ideal in the sense that as musical tone it is not natural even in the qualified sense that colour is. It is even more dependent on the human organism for its quality and synthesis. But I do not think Hegel means subjective in this sense, but that it directly expresses human emotion.

[386] Both ideas are contained in the word *Verschweben*, which means to hover and slowly vanish away.

[387] *Figurationen.* Their modal combinations.

[388] It is obvious that in this respect music to some extent infringes on the distinction Hegel has already pointed out between its content and that of poetry.

[389] By *verständige Formen* Hegel means, of course, forms that express an artistic, that is, an intelligible purpose. The whole passage is not very clearly expressed. The general meaning is, however, that as architecture surrounds its statues with a medium of material environment co-ordinated by artistic design and invention, so, too, music in its medium of emotional content is equally indefinite and may be used as an accompaniment (as architecture is a kind of accompaniment to statuary) in the melodic play of its harmonies to definite ideas in uttered speech. The reader of Browning will doubtless recollect the fine use made of architecture as metaphorical illustration in the poem "Abt Vogler." I think it was Schopenhauer who first spoke of architecture as frozen music. But Schelling speaks of it in the same way.

[390] I presume Hegel here refers primarily to scholastic music, musical exercises intended to exhibit the structure of music. The exercises, for example, of Cramer or Fuchs. Bach's forty-eight fugues would occupy a transitional place.

[391] *Tonseele.* There is, of course, something almost mystic in Hegel's conception of musical sound as the ideality issuing from the material world.

[392] That is, sculpture and painting.

[393] By *Haltpunkte* Hegel appears to mean material that will act as stays and supports in contrast to those which are indifferent.

[394] I presume by *solchen festen Bestimmungen* Hegel refers to the general definition of artistic function just enunciated. But the sense may possibly be, "while the point of departure is the stable determinations of natural form."

[395] We are inevitably reminded of the release which Art was to such men as Beethoven, Dante, Milton, and Blake.

[396] In the theme.

[397] It seems doubtful how how far a musician would accept this at least in so far as it applies to classical music of the formal type. The development, for instance, on the repetition of a theme in a sonata is at least part of the formal content of the sonata movement as a whole.

[398] *Ein Auseinandergehen.* Variations on a theme would be a good example. But surely the development of a theme may do precisely this in great measure, I mean disclose both the depth of it and its concentration.

[399] No doubt this is so if we assume the content to be mainly a theme, a motive. But the content of a movement includes the development. The main difference after all is the fundamental one that in music the content is unfolded in a time series and in the plastic arts instantaneously in spatial form. And in poetry the apprehension is also in a temporal series.

[400] It is impossible in English to reflect the play of words between *Erinnerung* (memory) and *Er-innerung* (self-penetration or ideal realization).

[401] I am not sure whether Hegel exactly means by *Phantasiren* what we understand as Improvization. But it is the only form of music that strictly applies to his definition. Even the rhapsodies of Liszt are controlled by the form, as in a sense all music is.

[402] As the plastic arts. It certainly is not so closely associated with a definition given outside it by Nature, that is, but it is obviously very closely associated to the formal modes of music, such as the laws of counterpoint, fugue, sonata, etc.

[403] The first is its relation to architecture, the second that to the plastic arts.

[404] That is, the ideas. By “receiving self-subsistency” Hegel means it maybe regarded independent of the art, something essentially outside it.

[405] By *Ton* Hegel means, of course, musical sound. The object of music is music and ideas only in so far as they are expressed in music.

[406] *In diesem Freiwerden.* In this free medium of its existence.

[407] How far would Hegel have applied this criticism to the great symphonies of his compatriots? I think it is obvious, at any rate, that his criticism of pure music is somewhat lacking in sympathy. Nowadays it is not even a wholly obvious fact that the song or the opera are the most popular. The truth is that musical education, and that is what the appreciation of programme or symphonic music

implies, has made enormous strides since his day. But his criticism will still hold for many in regard to more modern developments in Strauss and his school.

408 By *fertig* Hegel must mean here that the world of poetry is one whose claims to independent coherence is generally acknowledged.

409 By "universal" Hegel appears to mean more universally intelligible, He uses the same word in a like sense just below.

410 If Hegel means to imply that pure music, in so far as it presents ideas by suggestion, has any advantage over music the effect of which is entirely a musical effect he is on dangerous ground. The Pastoral Symphony of Beethoven may or may not be more popular than Beethoven's other symphonies, but it is unquestionable that its artistic merit depends exclusively on its claims as musical composition. And indeed its worth as music suggestive of ideas is mainly so great because, as Beethoven himself claimed, it is rather a suggestion of emotional mood than the imitation of natural sounds or the suggestion of distinct ideas. So far as popularity or universality of appeal is concerned, he may be right. But this is obviously no final test of the significance of music as compared with other arts, though it may mark a distinguishing feature. And surely music expresses emotions at least "as they are" (*selber*) more directly than poetry. Poetry no doubt gives them as we express them in ordinary life. But music makes us feel them as they are unexpressed in our souls, a still higher grade of reality.

411 Hegel probably never heard Beethoven's ninth symphony with its "Song of Joy." As to its success as set to music there may be two opinions, but the fact that it is the culmination of so celebrated a composition is in itself a qualification of Hegel's statement.

412 Both Mendelssohn and Schumann deplored the fact that they could get no really good libretto and would unquestionably not have received all the statements here without considerable qualification. Hegel appears to be too dominated by the character of Italian opera. German opera as further developed by Wagner and even in the hands of Beethoven and Glück and Weber makes a very different demand. It is unquestionably true that there must be a certain reciprocity of quality between the two. But some of the finest music has been written for some of the finest poetical language, namely that of our Bible. Composers like Bach, Handel, and S. S. Wesley insisted on having the very best form of their religious ideas they could obtain.

413 Lit., "Within the purely musical realm of tones." Hegel's strictures would only apply to the most formal kind of exercises or studies. It would really be a misnomer to say that Chopin's studies for the piano or Spohr's or even Kreutzer's exercises for the violin wholly come under it.

[414] It is on this ground that Aristotle calls music the most imitative art. They represent emotions directly without the mediatory office of Nature's objectivity (*vide* "Three Lectures on Aesthetic," by Bernard Bosanquet, p. 53).

[415] It is more subjective because the content is more ideal, and more closely related to the artist's personal qualities.

[416] More definite than feeling and soul-life is from tone.

[417] That is, vanishes with the evanescence of the music.

[418] *Die Geschicklichkeit eines virtuosen Machwerks. Machwerk* is used, of course, in a depreciating sense. The contrast is between it and a truly inspired composition.

[419] Lit., "Of the business on hand."

[420] *Gleichgültig.* I am not sure whether Hegel means fortuitous in the sense that Nature in its abstraction is such, or purely objective, *i.e.*, no self-reflection, probably the latter. They are "dead elements."

[421] That is, spatial externality.

[422] The meaning appears to me that apart from conscious life which can contrast the fleeting moments of Time with its permanent self-identity the process is without meaning — there is no process, it is a παντά ρεῖ with no differentiation.

[423] It cancels itself in so far as it makes itself an object. The dialectical movement of self-consciousness is here viewed in the bare form of its original abstraction.

[424] *Das Ich als solches.*

[425] *Abgeschmackte.* Not so much bad taste here as false judgment.

[426] *Auffasst.* Hegel would appear to mean the intelligent hearer rather than the composer, though the word would refer to either. Even then it is not clear why music should not be said to exist by its mere performance. But, of course, such presupposes the human executant, and this is possibly what Hegel intends to imply.

[427] *Nüancirt.* Made subject to the nuances or modifications introduced into such relations.

[428] *Verstand* as contrasted with *Vernunft.* The analytical faculty of science.

[429] That is, the quantitative basis.

[430] *Die haltungslose Dauer.* That is, a duration that is unbroken by arresting points in its progress.

[431] That is, self-conscious, synthetic unity holding the temporal process in relation to itself. It thus becomes not merely a *werden* but a *für sich seyn.* In contrast to the purely abstract process the self is *das Bei sich selbstseyende i.e.*, that which persists along with itself. This totality or aggregate of particulars Hegel calls *Sammlung.* The analysis is really an analysis of the form of conscious experience.

[432] This is the converse case of a series of definite points of contrast, but unrelated by any integrating principle. I admit frankly that I am not sure I have wholly seized the meaning in these difficult paragraphs. I have adhered in my translation, therefore, as closely as possible to the original.

[433] *Markirte.*

[434] *Herrschende Regel.*

[435] Because their orbits are elliptical and motion is accelerated as they approach the focus.

[436] *Verlebendigung.*

[437] He means of a specific collection of words, sentences.

[438] *Perioden.*

[439] *Umschwung.* Perhaps all that is meant is the return to the previous level, as we should speak of the rise and fall of voices.

[440] *Ein Körper.*

[441] *Seiner zeitlichen Gestalt.*

[442] *Gezwungene.* I presume the meaning is that the oscillations are effected by a curved form of musical instrument.

[443] I am not sure there is not a certain confusion here. Our text, at any rate, when speaking of wind instruments, refers to the column of air as the medium of sound, but in the case of stringed instruments draws attention rather to the thing which creates the waves of vibration, the string itself. The nature of the timbre of an instrument is no doubt an important one, but it may be questioned whether this distinction between line or column and surface is very satisfactory or sufficient.

[444] *Jenem linearen Tönen.* The expression appears to me not very easy to interpret even from Hegel's own point of view. In what sense can you call a musical tone linear? The theory here stated, though ingenious enough, appears to me to miss the fundamental question, what actually constitutes the timbre of an instrument, in its assertion, for instance, of distantly related harmonies or non-assertion of such. Even assuming that the form of the instrument, or the part of it set into vibration, may partially explain this, it is obvious, I think, that Hegel's manner of stating it is open to considerable criticism.

[445] *Die näher abgeschlossene Bestimmtheit.* The meaning seems to be that definition of them in which they stand out with most distinctness from others.

[446] The comparison is unfortunate — in two respects. Violet is a cardinal colour, and the theory of Goethe to which it refers is, of course, untenable.

[447] The true scientific reason why octaves resemble each other so much more closely than two notes at any other interval is that the upper of two notes at an octave's distance is the first "upper-partial" tone of the lower, and all its harmonies are also harmonies of the lower note; the compound tone, for there is no entirely simple tone, of the higher note contains no new sound, which is not in the compound tone of the lower. This is not the case with two notes at any other interval.

[448] *Ihre besonderen Seiten.* I presume this means what is immediately called below the several intervals between note and note.

[449] There is really a distinction between the consonance of the dominant and a major or minor third.

[450] That is, the third is only third in relation to the key-note, or the leading-note only as the note previous to the octave.

[451] Three notes are really essential to any true chord.

[452] The mediant lies about midway between the tonic and dominant as the third of the scale. The researches of Helmholtz prove that the distinction between consonant or semi-consonant and dissonant intervals is not arbitrary, but the result of the nature of the intervals themselves. A musical tone is mostly a compound one, containing, besides its principal tone, other tones with fixed relations to the lowest note, called harmonics, or "upper partials." Helmholtz has shown that when two of the earlier-produced and stronger of these upper partial tones coincide in two notes sounded together, the resulting tone is pure, free, that is, from the inequalities known as "beats" (Prout, "Harmony," 10th ed., pp. 21, 22).

[453] As, of course, in the scale, notes independent of each other.

[454] *Schärfe.*

[455] The reader of Browning will recall how the poet in his "Abt Vogler" exclaims "Why rushed the discords in, but that harmony should be prized?" or speaks of blunting the minor into the ninth where the musician "stands on alien ground, surveying awhile the heights."

[456] This extreme emphasis on melody must be read as further explained lower down of melody in the wider sense. Even as thus qualified it is rather an overstatement. It may be questioned whether in the mind of a musician of genius the freedom of harmonic progression is of a different quality to that of melodic. It may *appear* no doubt less spontaneous. But it is the task of the great artist to overcome that appearance in one case as much as in the other.

[457] It may be doubted how far such a statement is true of many chord progressions in modern music. It seems to me that this notion of harmony as *für sich* having no musical significance is, to say the least, very misleading.

[458] This really is the point. Inspired harmony in its progression unfolds what is really a tissue of melodic threads. The complex musical structure of a Brahms symphony is a good example.

[459] Lit., "the free self-subsistency (*Beisichseyn*) of subjective life."

[460] Hegel puts it the other way. What he means is that in the medium of music we neither apprehend objects of sense nor ideas as we receive them in imagination or thought.

[461] Hegel throughout uses the term *Innerlichkeit.* That which is the Inmost is, in fact, the ideal. It is the *raison d'être* and the notion itself.

[462] He means at the point proposed by the dramatic theme. Hegel's words are literally "it subdues the subject (*i.e.*, of consciousness) referably to its simple concentration (*i.e.*, on the subject at hand)."

[463] The above distinction is hardly consonant with that of customary parlance. We should rather say that the melody of the song gave an utterance to the words, and the instrumentation was, for the very reason that it was more independent, more directly an accompaniment. But the point emphasized here seems to be the closeness of the association. In this aspect, no doubt, the music actually sung is more an accompaniment to the intelligible content. As a rule accompaniment is generally used as the accompaniment of a song or choral writing, and Hegel himself uses it in this sense previously.

[464] A general truth, no doubt. But not without qualification if we consider the works and indeed the execution of such giants as Bach and Handel.

[465] That is, particularity due to the idiosyncrasies of the artist, and merely personal to him. But the statement applies to classic art more strictly than modern.

[466] That is, music as an accompaniment.

[467] *Gediegenheit.* Something that rings true as a whole, not a thing of patches.

[468] The music of Mendelssohn and others in this direction will raise a doubt in some whether Hegel does not rather overstate his case here.

[469] *Besonderung.* The relative isolation that is effected by marked assertion.

[470] Throughout this discussion the personal bias of Hegel for the Italian opera is obvious. In the light of the actual knowledge of his day the wonder is that his own tastes permitted his being even as fair as he is. It may be doubted whether he had any strong sense for orchestral or chamber music at all. His reflections must be read throughout with this reservation.

[471] Or, as Hegel more technically calls it, and I have above translated it, "subjectivity."

[472] That is, dependent on living beings for its presentation in every case.

[473] The execution of Paganini is, of course, the classic example. But all cadenzas executed by a great artist, even though carefully studied, express something of the spirit.

[474] Hegel means that such music expresses not so much rational freedom as the fundamental independence of the self-conscious principle.

[475] By *dürftiger Kopf* I understand Hegel to mean the headstrong charlatan as contrasted with the virtuoso who is also a trained musician. Paganini had a vein of both in his composition. The epithet *dürftig*, lit., thirsty, is, however, not very clear, and in so far as it is, the emphasis would not be so much on quackery as absence of all training.

THIRD PART (CONTINUED)

THE SYSTEM OF THE PARTICULAR ARTS

SUBSECTION III

THE ROMANTIC ARTS

CHAPTER III (CONTINUED)

POETRY

INTRODUCTION

I

The temple of classical architecture demands a god, who resides therein. Sculpture exhibits the same in plastic beauty, and confers forms on the material it employs for this purpose, which do not in their nature remain external to what is spiritual, but are the form itself immanent in the defined content. The corporeality, however, and sensuousness, no less than the ideal universality of the sculptured figure, are opposed on the one hand to subjective ideality, and in part to the particularity of the individual, in whose element the content of the religious, no less than also the worldly life, must secure reality by virtue of a novel form of art. This mode of expression, which is of subjective import, and at the same time particularized in its characterization, the art of painting itself contributes under the principle of the plastic arts. In other words it subordinates the realistic expression of form to the more ideal presentment of colour, and makes the expression of the ideality of soul the central point[1] of the presentment. The universal sphere, however, in which these arts are motived, the one in the ideal of symbolism, the other in the plastic ideal, the third in the romantic type, is the sensuous or *external* form of spirit and natural objects.

The spiritual content possesses, however, as essentially appertinent to the ideality of consciousness, a determinate existence which is for this ideality

at the same time foreign to the medium itself of the external appearance and envisagement presented to it by material form. From this foreign element it is further necessary that it removes its conceptions in order to place them in a realm which, in respect to material no less than the mode of expression, is independently of an ideal or subjective character. This was the forward step which we saw *music* make, in so far as it embodied pure ideality and subjective emotion in the configurations of essentially resonant sound rather than in visible forms. It, however, passed by this very means into a further extreme, that is, an ideal mode of concentration not fully explicit, whose content in musical tones itself only found symbolic expression. For tone taken by itself is without content, and has its definition in the numerical relations, so that what is qualitative in the spiritual content no doubt generally corresponds to these quantitative relations which are expressed in essential differences, oppositions, and mediation, but in its qualitative determinacy is not entirely able to receive its impression in musical tone. If this aspect is not wholly to fail the art of music must, by reason of its onesidedness, summon to its assistance the more definite articulation of language, and requires for its more secure attachment to particularity and the characteristic expression of the content a text, without which it is unable to complete fully the ideality which is poured forth by means of musical tones.

By virtue of this expression of ideas and emotions, the abstract ideality of music receives a clearer and more secure exposition. At the same time what we have here unfolded by its means is, to a certain extent, not the point of view of idea and the artistic mode adapted to its expression, but merely the emotional life as it accompanies the same; also in part we find that here, too, music entirely divests itself of fusion with the verbal text in order to develop its own movement without restraint in the world of tone simply. For this reason the realm of idea, which is unable to remain under I

such a more purely abstract mode of ideal intensity, and seeks a configuration in a world which embraces its one homogeneous and concrete reality, breaks away on its part likewise from the bond of music, and in the exclusive art of poetry discovers the adequate realization it demands.

Poetry, in other words the art of human speech, is the *third* or final step, the *totality*, which unites and embraces in a yet higher sphere, in the sphere of the very life of Spirit itself,[2] the two extremes of the plastic arts and music. For on the one hand poetry contains just as music does the principle which apprehends an ideal content in its ideality, the principle which in architecture, sculpture, and painting is lost, or at most incompletely asserted. And on the other hand it expatiates itself, under the modes of ideal conception, intuition, and feeling simply, in an objective world, which does not entirely destroy the defined forms of sculpture and painting, and is capable of unfolding all the conditions of an event, a succession or interchange of emotional states, passions, conceptions, and the exclusive course of human action with more completeness than any other art.

2. But in a still more intimate way the art of poetry constitutes a third or final term in its relation to painting and music regarded as the *romantic* arts.

(*a*) One reason of this is that its principle is that generally of an *intelligence* which has nothing further to do with gross matter as such, seeking, as is the case with architecture, to transform it through symbolism to an environment related analogically to spiritual life, or as in the case of sculpture in order to implant upon material substance the natural form congenial to such life under the spatial condition of its expression. What the end is now is to express immediately for mind the manifestations of Spirit with all its ideas of imagination and art, without setting forth their external and visible bodily presence. And a further reason consists in this, that poetry is able to grasp in the form of ideality itself and with a far greater wealth than is possible for music or painting, not merely the innermost

actuality of conscious life, but also what is particular and individual in external existence, and equally able to contrast such facts in the complete diversity of their specific traits and accidental peculiarities.

(*b*) The art of poetry is, however, as totality, also again, from another point of view, essentially to be distinguished from the above-mentioned arts whose fundamental qualities it thus in a measure combines.

(*α*) In this respect, if we compare it with painting, the latter art is throughout at an advantage, where it is of importance to bring before our senses a content under the condition of its external appearance. It is true no doubt that poetry is able by various means to envisualize objects precisely in the way that for the imagination generally the principle of objectification is made real to our intuitive sense. But in so far as conceptive power, in the element of which poetry pre-eminently moves, is of a spiritual nature and implies the presence of the universality of thought, it is incapable of attaining the definition of sensuous perception. On the other hand, the varied traits which poetry brings together, in order to make the concrete form of a content visible, do not fall as with painting into one and the same totality, which is set before us wholly as a simultaneous appearance of all its details, but they break apart, inasmuch as the imagination can only give us the complexity it contains under the form of succession. This is, however, only a defect from the sensuous point of view, a defect which reason is able in its own way to rectify. That is to say, inasmuch as human speech, even in the case where it endeavours to summon before our sight a concrete object, is not concerned with the sensuous apprehension of an immediate external object, but always with the ideal relation, the mental intuition, for this reason the particular characteristics, albeit they are set before us in a series, are nevertheless fused together in the element of one essentially homogeneous spirit, which is able to qualify the effect of succession, to

bring the varied array into one picture, and to secure and enjoy this picture in imaginative contemplation. Moreover, this deficiency of sensuous realization and objective definition, when we contrast poetry with painting, brings as a contrary result the possibility of an incalculable superfluity of material. For inasmuch as the poetic art in painting restricts itself to a determinate space, and even more to a distinct moment in a situation or action, for this reason it is prevented from portraying an object in its entire ideal profundity no less than in the extension of its temporal development. But what is true is throughout concrete in the sense that it comprises within its embrace a unity of essential determinations. In its phenomenal appearance, however, these are not merely unfolded as a co-existent spatial phenomenon but in a temporal series as a history, whose course painting is only able to present in a relatively inadequate manner. Even in the case of every stalk, every tree, each has in this sense its history, a change, sequence, and exclusive whole of varied conditions. And this is even more true of the sphere of spirit, which can only be exhaustively portrayed as veritable spirit in phenomenal guise when it is set before our imagination as such a process.

(*β*) We have already seen that poetry possesses for its external medium that of tone in common with *music*. The wholly external, or, as we might say in the false sense of the expression, the objective material in the progressive series of the particular arts finally vanishes in the subjective medium of sound, which is divested of all visibility, and which suffers an ideal content only to be apprehended by a conscious state independent of sight.[3] For music, however, the configuration of musical *tone* as such is the essential end. For although the soul in the course and movement of melody and its harmonic relations presents what is ideal in objects, or its own ideal content, to the emotional life; yet the ideality thus presented is not pure ideality, but the human soul interwoven in the closest way with the musical tone as its expression, and the configuration of such musical expression

which confers on music its true character. So much is this the case that music receives its independent position as an art just in proportion as the animation given by it to the emotional life is more emphasized in the world of pure music than in that of man's ordinary spiritual activity.[4] But for this very reason it is only to a relative degree capable of reproducing the variety of spiritual ideas and intuitions, the entire extension of the ideal wealth of conscious life: it remains restricted to the more abstract universality of all that it grasps as content, and the more indefinite manifestations of our emotion.

In the like degree, then, that mind (*Geist*) elaborates the more abstract universality in a concrete whole of idea, ends, actions, and events, and no less contributes to its conformation the particularizing perception, it not only forsakes the subjective life of mere emotion and builds up that life into an unfolded realm of objective reality in this case, too, within the ideal world of the imagination itself, it is compelled, by virtue of the nature of such transformation, to forsake the attempt to express the new realm thus secured solely and exclusively by means of tone relations. Precisely as the medium of sculpture is too poor to express the more ample content that it is the function of the art of painting to call into life, so too the conditions of musical tone and melodic expression are unable to realize fully the imaginative pictures of the poet. For these in part possess the ideas more accurately defined to consciousness and, in part, the form of external appearance impressed on the inner sense of perceptive reason. Spirit consequently withdraws its content from musical tone as such, and declares itself through words, which it is true do not entirely forsake the element of sound, but sink to the purely external sign of the communication. In other words, by means of this repletion with spiritual ideas, musical tone becomes the voice of articulate words; language, in its turn, is diverted from an end in itself to a means of ideal expression which has lost its independent self-

subsistancy. This constitutes in fact what we have already established as the essential difference between music and poetry. The content of the art of speech is the collective art of the world of ideas elaborated by the imagination, the spiritual which remains at home in its vision, which remains in this ideal realm, and, even in its movement toward an objective world, is only conscious of the same as a symbol that differs from its own conscious content. In music art reproduces the penetration of Spirit in a sensuously apparent and present form. In poetry it even forsakes the element of *musical tone* and articulation opposed to it, at least to the extent that this musical tone is no longer reclothed in fully adequate externality and the exclusive expression of that content. The ideal no doubt is expressed, but it fails to discover its real existence in the sensuous medium of tone, despite the fact that it is of a more ideal character; this it discovers exclusively in its own essential content, by virtue of which it expresses the content of mind as it is realized in the ideality of the imagination simply as such.

(*c*) In the *third* place, and finally, if we consider the specific character of poetry relatively to this distinction between music and painting, and we may include with it the other plastic arts, we shall find the same simply to consist in the subordination of the mode under which all poetical content is envisaged and configured by the medium of sense. In other words, when tone, as it does in the art of music, or for that matter, colour as in that of painting, no longer essentially recovers and expresses the entire content, in that case the musical treatment of the composition under its aspects of time, no less than those of harmony and melody, drops away; we have left us merely the generalized configuration of the time-measure of syllables and words, to which we may add rhythm, euphony, and the like. And further, it is to be noted that we have this, not in the sense of a genuine medium for the content, but rather as a mode of externality which is accidental, and

which only receives an artistic form, because art cannot permit any mode of its external manifestation whatever to be entirely a question of accidental caprice.

(*α*) In connection with this withdrawal of the spiritual content from the sensuous medium we are at once met with the question what it is then which, under such a view, constitutes the actual externality or objectivity in poetry, that of tone being thus excluded. The answer to this is simple. It is the *ideal envisagement* and *imaginative content* itself. We have here spiritual forms substituted for sensuous, and supply a configurative material, such as we met with before in marble, bronze, colour, or musical tones. In other words, we must guard ourselves from such an inadequate statement of the facts as that ideas and imagery are nothing more or less than the *content* of poetry. This is unquestionably true in a sense, as we shall demonstrate more closely later on. Despite this, however, we are equally justified in asserting that idea, imagery, emotion, and the like are specific modes, under which every content in poetry is subsumed and manifested; and consequently, that is, owing to the fact that the sensuous aspect of the communication remains throughout a purely accidental one[5] — it is these forms which supply the real material which the poet has to elaborate artistically. No doubt the fact, the content, must in poetry, as in other arts, receive its due objectification for spirit; objectivity in this sense, however, is the exchange of what was previously an external reality for one that is ideal; one which receives an existence exclusively in conscious life itself, as something conceived or imagined exclusively by mind. Mind is here on its own ground objective to itself, and it suffers the medium of speech merely as a means, that is to say, partly as one of communication, and partly as one of immediate externality, from which, as from the pure symbol merely, it is withdrawn throughout from itself into itself. For this reason, in the case of genuine poetry, it is of no consequence whether a

poetical work be read in private or listened to; and for the same reason it can also, without essential depreciation of its value, be translated into other tongues, be transferred from versification into prose, and thereby transmitted in tonal relations of an entirely different character.[6]

(*β*) In the *second* place the question presents itself as to the *nature* of the object *for* which the ideal concept is employed in poetry. We answer that it is thus used relatively to essential truth in everything of interest to Spirit; not merely, that is, relatively to what is substantive in the same in the universality of its symbolic significance or classical differentiation, but equally to all that is at the same time specific and particular, in short, to practically everything in and with which mind is in any way interested and concerned. The art of language, consequently, both in respect to its content and the mode under which that content is made explicit, possesses a field of immeasurable compass, wholly incomparable with that of the other arts. Every content, every sort of spiritual or natural fact, event, history, deed, action, all conditions, whether ideal or external, fall within the domain and configurative powers of poetry.

(*γ*) Material of this most varied character is not, however, made poetical merely by reason of the fact that it is in a general way the content of idea. Ordinary consciousness is able to elaborate precisely the same content in the field of ideas, and to particularize concepts without creating any poetical result. We recognized this fact when we called the concept of mind merely the *material* or medium, which only receives a form adapted for poetry, in so far as it partakes of a novel configuration by virtue of art. In precisely the same way mere colour and tone in their immediacy are not as such the colour or tone of a painter or a musician. We may in a general way describe the distinction by stating that it is not the *idea as such*, but the *imagination* of the *artist* which creates a poetical content, under conditions, that is, in which the imagination grasps the same content in such a way that it is itself

therewith associated in language, words and their more beautiful conjunction as human speech, just as in the other arts we find it present in the architectonic form; the plastic of sculpture, that adapted to painting, or musical tones and harmony.

A further necessary limitation of the art's appearance is this that the content must, on the one hand, not be embraced in relations applicable to mere *thinking*, whether that of science or speculative philosophy, nor further in the form of inarticulate *emotion*, or with a clarity and self-sufficiency which appeals *exclusively* to the organs of sense;[6] neither, in another direction, must it suffer the idea to pass entirely into what we may in general terms describe as the contingency, divisions, and relativity of *finite* reality. The imagination of the poet in this respect must maintain a middle course between the abstract universality of pure thinking and the concrete corporeality of material objects, in so far as we are acquainted with the latter in the productions of the plastic arts. Furthermore such an art must generally conform to the requirements we have, in an early section of this work, insisted as essential to every art-product. In other words, the art itself must find in its content the adequate object of its appearance, must elaborate everything, which it embraces, so far as the interest appeals to the intelligence simply,[7] as an essentially independent and self-exclusive world. Only in so far as it does this is the demand of art satisfied, and the content thereof becomes, by virtue of the specific mode of *its* manifestation, an organic whole, which in its parts presents the appearance of a limited association and ideal synthesis, while at the same time, as contrasted with the world of accidental subordinations, its consistency is one of essential freedom, a whole made explicit through itself.

3. The last point to which we must in conclusion draw attention in respect to this distinction between poetry and the other arts is connected with the different mode under which the imagination of the poet

substantiates its ideas in the objective medium of its exposition. The arts hitherto considered were entirely serious in their attachment to the material of sense, a medium in which they themselves were operative, in so far as they merely bestowed on their content a form, which could be throughout accepted and elaborated by means of conglomerations of material substance, whether bronze, marble, or wood, or the media of colour and tones.[8] In a certain sense, no doubt, poetry also has to meet a condition somewhat similar. That is to say, in poetical composition we must not overlook the fact that its results have to be intelligible to mind by means of the communication of human speech. But we shall find none the less that the situation in the two cases is essentially altered.

(*a*) Otherwise expressed, by reason of the importance pertaining to the material aspect in the plastic arts and music, we find that, as a result of the *defined* restrictions of this material, only a *limited* number of conceptions can be fully reproduced in a particularized form of reality such as stone, colour, and tone: the content therefore and the possibilities of artistic composition are narrowed within very definable limits. It was on account of this fact that we were able to associate closely and exclusively every one of these specific arts with one particular form of artistic creation pre-eminently adapted to it. In this way the form of symbolism was appropriate to architecture, the classical to sculpture, and the romantic to painting and music. It is no doubt true that the particular arts in both directions from and toward their proper domain tended to pass over into the other forms. We took account of this fact when we found it possible to refer to a classic and romantic style of architecture, a symbolical and Christian type of sculpture, and even used the term classic in connection with painting and music. Departures such as these from the prevailing type were, however, merely experimental essays which prepared the way in subordination to a new type rather than its culminating effort; or they showed us how one art tended to

pass beyond its true limits in seeking to grasp a content or a relation to its material of a type that only a further art development could adequately elaborate. Generally speaking, we have seen that architecture has least resource in the expression of its content; in sculpture there is already an increase of possibility, which is further extended to its widest range[9] by painting and music. And the reason of this is that in proportion as the ideality and particularization under all its aspects by the external medium is made more explicit the variety of the content and of the forms it receives also increases.

Poetry, on the other hand, casts itself free of all subordination to the material of sense, at least to this extent, that in the definition of external or objective expression no reason whatever remains why it should restrict itself to specific content or any limitation to its power of composition and reproduction. It is therefore exclusively united to no specific art type; rather we may define it as the *universal* art, which is capable of reclothing and expressing under every conceivable mode every content that can possibly enter into or proceed from the imagination of man. And it can do this because its material is nothing more or less than the imagination itself, which is the universal root and ground of all the particular arts and their specific types.

We have already, in another connection, when concluding our discussion of the particular artistic types, come across what was practically the same thing. What we sought for, then, in our conclusion was that art in one of its types should make itself independent of that mode of representation properly called specific, remaining thereby predominant above the entire sphere in which such a totality of particularization is reproduced. An elaboration so comprehensive is among all the particular arts by the very nature of the case only possible to poetry. Its realization is effected through the development of poetical creation in part by means of the actual

reconstitution of every particular type, and partly by the liberation of the mode of conception and its content from the boundaries fixed for it in the essentially exclusive types of conception, whose character we have severally defined as symbolical, classical, and romantic.

(*b*) The above considerations will further serve to justify the position, which, in the course of our inquiry, regarded as the development of a philosophy, we previously assigned to the art of poetry. In other words by reason of the fact that poetry is, to a degree quite impossible to any other mode of artistic production, concerned with the universal simply as such in Art, we might appear to have some reason for insisting that it marks the commencement of an investigation in the full sense of the word philosophical, and only from such a starting point can we enter into the sphere of particularization, in which we find the series of the other arts as limited and determined by their specific sensuous medium. Looking back, however, at the result arrived at in our investigation of the particular art types we shall find that the course of philosophical evolution consisted, first, in an increased penetration of the ideal content, and, from another point of view, in the demonstration that originally Art sets forth in the search, then in the discovery of and finally with an advance beyond that content compatible with its powers. This notion of the beautiful and *Art* must enforce itself in *the arts* themselves. The starting-point of our inquiry, therefore, was architecture, in which we found merely an impulse toward the complete representation of what pertains to Spirit in a material medium. This is so much the case that it is only through sculpture that art first attains to a genuine interfusion of ideality with the medium; and further that only in the arts of painting and music do we reach the stage where, by virtue of the ideal and subjective character of their content, we find the perfected fusion effected no less under the aspect of conception than that of practical execution in the medium accepted. This process culminates most decisively

in poetry, by virtue of the fact that the very nature of its objective realization can only be apprehended as an effort to draw apart from and cancel the material of sense rather than one of reproduction which does not as yet venture to clothe itself and move in the objective medium of sense-perception. In order, however, to make this liberation intelligible in philosophical terms it is of importance that we have already disposed of the question what it is from which art undertakes to liberate itself. This question stands in close relation to the fact that poetry is essentially capable of embracing the entirety of intelligible content and artistic modes of expression. We may add further that we have viewed this as the acceptance of a totality, which can only be interpreted philosophically as the abrogation of limitation in particularity. Our previous consideration of what we mean by things that are one-sided would be involved in such an exposition, the self-exclusive character of such one-sidedness being cancelled by such a totality.

It is only through the course of such an exposition that we can effectively demonstrate that poetry is the specific art in which a point is reached which marks the beginning of the disintegration of art itself, a point at which the philosophical consciousness discovers its bridge of passage to the notion of religion as such, as also to the prose of scientific thought. The boundary lines of the realm of beauty are, as we have already seen, on the one hand the prose of finite condition and our ordinary conscious life, starting from which Art makes its effort in the direction of truth, and, on the other, of the loftier spheres of religion and science, from which it passes over into a comprehension of the Absolute till more emancipate from all material association.

(*c*) Despite therefore the completeness with which the art of poetry reproduces, under a mode of objectification that is most ideal, the entire totality of Beauty, nevertheless intelligence is able to discover even here too

in this final domain of art a residue of defect. We may for this purpose within our art-system directly contrast the poetic art with that of architecture. In other words architecture was still unable to subordinate the external material to the ideal content sufficiently to clothe the same in a form adequate to mind; poetry on the other hand carries the process of negating its sensuous medium so far that instead of transforming that which stands in opposition to gross spatial matter, namely tone, as architecture does with its material into a significant symbol, it rather reduces it to a mere sign of no significance. But by doing so it destroys the fusion of spiritual ideality with external existence, so thoroughly that to this extent it ceases to be compatible with the original notion of Art. In other words it comes dangerously near to bidding goodbye to the region of sense altogether, remaining wholly absorbed in that of ideality. The fair mean between these extremes of architecture and poetry is secured by sculpture, painting, and music. Every one of these arts not merely still reproduces the spiritual content completely in a medium borrowed from the objective world, but also leaves us with that which lies open to our senses, no less than our intelligence. For although painting and music, regarded as romantic arts, attach themselves to a medium already more ideal, they do none the less supply the immediacy of objective existence, which, however, in this increase of ideality, shows indications of disappearance, while again from the opposite point of view they prove themselves, through their media of colour and tone, more profuse in fulness of particularization and manifold configuration than is required from the material of sculpture.

No doubt the art of poetry in its turn also endeavours, as a set-off to this defect, to place the objective world before us with a breadth and variety which even painting, at least in a single composition, fails to secure: none the less this comprehensiveness remains throughout merely a realization confined to consciousness itself; and, if it so happens that poetry, in

response to a demand for more material artistic realization, attempts to increase the impression on our senses, it is only able to do this by either borrowing these effects from music and painting, in order to secure artistic means otherwise foreign to it; or it is forced, if it seeks retain its genuine character, to employ these sister arts only under a subordinate relation of service, while the main stress is laid on the ideas of conscious life, the imagination which appeals to the imagination, with which it is above all concerned.

This will suffice for discussion of the general relation under which poetry is placed to the other arts. We shall now proceed to a closer examination of the art of poetry itself, and with a view to this propose to co-ordinate the same as follows.

We have already seen that in poetry it is the ideal concept itself from which we derive content no less than medium. By reason, however, of the fact that we already find outside Art's domain the world of idea to be the most obvious mode of conscious life, it is above everything else important to distinguish the conception of *poetry* from that of *prose.* The art of poetry, however, is not complete in this ideal world of the imagination alone. It is necessary that it should clothe the same in expressive *language.* It has therefore a twofold task confronting it. On the one hand it is called upon so to arrange this world of constructed idea that it may admit of complete translation into speech: on the other it must take care not to leave this medium of language in the form appropriated by ordinary conscious life. In other words such must be treated poetically in order that the expression of art may be distinguishable in the selection of words no less than their position, and even their sound from that of ordinary prose.

Furthermore, on account of the fact that, though poetry avails itself of language as a means of expression, it secures by far the most unqualified freedom from those conditions and restrictions imposed on the other arts by

virtue of the particularization of their material, it is possible for a poetical composition in a pre-eminent degree to elaborate every one of the various modes of expression, otherwise adopted unaffected by the onesidedness incidental to their application to a particular art. The subdivision of such *modes of expression* in all their variety is consequently by far the most complete in the works of poetry.

The further course of our investigation may now be epitomized as follows:

First, we have to elucidate what is in general terms *poetical,* and the *poetical composition* in particular.

Secondly, poetry will be examined as a means of *expression.*

Thirdly, we shall deal with the subdivision of the art into *Epic, Lyric,* and *Dramatic* poetry.

[1] *Mittelpunkt.* We should rather say the unifying significance of the creation.

[2] It would be perhaps better to translate *geistigen Innerlichkeit* with the words "the self-conscious life of the human reason." This is developed and explained, however, in the next paragraph.

[3] Hegel expresses this as "making the inner or ideal content perceptible to the ideal faculty," that is, *prima facie*, consciousness, or at least that sense which is nearest related to it, viz., hearing.

[4] By *statt des Geistigen* Hegel clearly contrasts pure music with music related as accompaniment to human speech in song.

[5] Lit., "one that merely plays by the way."

[6] Such a statement is obviously one which would be strongly resisted. The stress laid here on the purely ideal content as contrasted with the beauty of rhythm and modal arrangement would certainly suggest that Hegel was deficient in a sense for the musical possibilities of language I presume he does use *gebunden* in the sense of verse.

[7] Hegel's expression is *in rein theoretischen Interesse.*

[8] The medium of music is not of course strictly on all fours with the others.

[9] That is under the limits of these four arts.

I

POETICAL COMPOSITION AS DISTINGUISHED FROM THAT OF PROSE

We find it difficult to recall a single writer among all who have written on the subject of poetry who has not evaded the attempt to describe what is poetical as such, let alone a clear definition. And in fact if any one begins a discussion upon poetry, regarded as an art, without previously having investigated the nature of the content and mode of conception appropriate to Art in its most general terms, he will find it an extremely difficult matter to determine where we must look for that in which the essential character of poetry consists. To an exceptional degree is this failure to tackle this problem visible in those cases where a writer takes as his point of departure the actual execution in particular works of art, and seeks to establish, by means of this connoisseurship, some general principle which he may apply as relevant to every sort and kind of composition. In this way works of the most heterogeneous character come to rank as genuine poetry. If we once start from such assumptions, and then proceed to the inquiry by virtue of what productions of this nature can be reasonably classed together as poems we are at once confronted with the difficulty I have above adverted to. Happily our own position here is not that of these inquirers. In the first place we have by no manner of means arrived at the general notion of our subject-matter through an examination of any particular examples of its

display; we have on the contrary sought to evolve the actual constitution of the same by a reference to the fundamental notion.[1] Agreeably with this it is not part of our demand that everything in ordinary parlance regarded as poetry should in our present inquiry fall into the general notion we have accepted. At least this is certainly not so in so far as the decision whether any particular work is or is not poetical is only deducible from the notion itself. Furthermore it is unnecessary now to expound more fully what we understand by the notion of poetry. To do this we should simply have to repeat again the course of our inquiry into the nature of Beauty and the Ideal as developed in general terms in the first part of this work. The intrinsic character of what is poetical stands in general agreement with the generic notion of artistic beauty and the art-product. That is to say, the imagination of the poet is not, as is the case with the plastic arts and music by reason of the nature of the *materia*, through which they are reproductive, constrained in its creative activity in many directions, and forced to accept many others of a onesided or very partial completeness; it is on the contrary merely subservient to the essential requirements and general principle of an ideal and artistic presentation.

From the many different points of view applicable to our present purpose, I will attempt to emphasize merely those of most importance, as for example, *firsts* that which relates to the distinction between the *mode of composition* employed respectively by poetry and prose; *secondly*, that which contrasts a *poetical work* as completed with one of prose; and, *finally*, I propose to add a few observations relative to the subjective faculty which creates, or, shall we say, the *poet* himself.

I. THE COMPOSITION OF POETRY AND PROSE

(*a*) In so far as the *content* appropriate to poetical composition is concerned we may, relatively speaking at any rate, exclude the external

world of natural fact. It is spiritual interests rather than the sun, mountains, landscape, or the bodily human form, and the like, which are its proper subject-matter. For, although it naturally embraces the element of sensuous impression and perception, it remains none the less, even in this respect, an activity of mind. Its main object is an intuition of ideality, to which it stands as spiritual activity in closer relation and affinity than is possible for external objects, as presented in their concrete substance to the senses. The world of Nature therefore only enters into the content of poetry in so far as mind discovers therein a stimulus or a material upon which to exercise its own energy; as, for example, where it is regarded as the environment of man, merely possessing essential worth in its relation to the ideality of conscious life, which moreover can put forward no claim to be itself the independent object of poetry. The object, in short, which fully corresponds to its appeal is the infinite realm of Spirit. For the medium of language, the most plastic medium possessed immediately by conscious life, and the one most competent to grasp its interests and movements in their ideal vitality, precisely as is the case with the material of the other arts, such as stone, colour, and tone, must necessarily and above all be employed to express that which it is most qualified to express. It is consequently the pre-eminent task of poetry to bring before our vision the energies of the life of Spirit, all that surges to and fro in human passion and emotion, or passes in tranquillity across the mind, that is the all-embracing realm of human idea, action, exploit, fatality, the affairs of this world and the divine Providence. It has been the most universal and cosmopolitan instructor of the human race and is so still. Instruction and learning are together the knowledge and experience of what is. Stars, animals and plants are ignorant of their law — it does not come into their experience; but man only then exists conformably to the principle of his being when he knows what he is and by what he is surrounded. He must recognize the powers by which he is driven

or influenced; and it is just such a knowledge which poetry, in its original and vital[2] form, supplies.

(*b*) It is, however, also a content of the same character which belongs to man's *ordinary* conscious life. This too instructs him in general laws, as such at least are interpreted by the motley crowd of human life, in their distinction, coordination, and significance. The question therefore arises, as previously observed, as to the nature of the distinction between the mode of conception severally adopted by prose and poetry, a similarity in the content of each being assumed as possible.

(*α*) Poetry is of greater antiquity than speech modelled in the artistic form of elaborate prose. It is the *original* imaginative grasp of truths a form of knowledge, which fails as yet to separate the universal from its living existence in the particular object, which does not as yet contrast law land phenomena, object and means, or relate the one to the other in subordination to the process of human reason, but comprehends the one exclusively in the other and by virtue of the other. For this reason it does not merely, under the mode of imagery, express a content already essentially apprehended in its universality; on the contrary it lingers, conformably to its unmediated notion, in the unity of concrete life itself, which has not as yet effected such a separation or such an association of mere relationship.

(*αα*) Under the above forms of envisualization, poetry posits all that it comprehends as an exclusive and consequently independent totality, which, despite its capacity for a rich content and an extensive range of condition, individuals, actions, events, emotions and ideas of every kind, nevertheless is forced to exhibit the same in all their wide complexity as an essentially self-determined whole, as displayed and motived by the unity, whose individual expression this or that fact in its singularity actually is. And consequently the universal or rational principle is not expressed in poetry in its abstract universality, or in the complexus which lies open to

philosophical exposition or under the relation of its varied aspects apprehended by science, but on the contrary as a vital union, in its phenomenal presence, possessed with soul and self-determined throughout; and it is further expressed in such a way that the all-embracing unity, the real soul of its vitality, is only suffered to be operative in mysterious guise from within outwards.

(*ββ*) The character of this mode of apprehending, reclothing and expressing fact is throughout one of construction. It is not the fact itself and its *contemplative*[3] existence, but reconstruction and speech which are the object of poetry. Its entrance on the scene dates from the first efforts of man at self-expression. What is expressed is simply made use of to satisfy this desire. The instant man, in the midst of his practical activities and imperative duties, seeks to summarize this effect for mind and to communicate himself to others, then we have some kind of artistic expression, some accord with what is poetical. To mention one from a host of examples, there is that distich which we read in Herodotus referring to the slain heroes of Thermopylae. As for its content it is simply the fact, the bare announcement that four thousand Peloponesians on a certain spot fought the battle with three hundred myriads. The main interest is, however, the composition of an inscription which communicates to contemporary life and posterity the historical fact, and is there exclusively to do so. In other words, the expression of this fact is poetical; it testifies to itself as a deed (εἰν ποιεῖν) which leaves the content in its simplicity, but expresses the same with a definite purpose. The language, in which the idea is embodied, is to that extent of such increased value that an attempt is made to distinguish it from ordinary speech; we have a distich in lieu of a sentence.

(*γγ*) For this reason, even from the point of view of language, poetry makes an effort to keep its domain singular and distinct from ordinary parlance, and to accomplish this elevates its expression to a higher virtue

than that of merely articulate expression. We must, however, not only in this particular respect, but for the purposes of our present inquiry generally, make an essential distinction between a primitive poetry, which arises *previous to* the creation of ordinary artificial prose, and that mode of poetical composition and speech the development of which is effected where already the conditions of our everyday life and prosaic expression exist. The first is poetical without intention, in idea no less than speech; the latter, on the contrary, is fully conscious of the sphere, from which its task is to detach itself, in order that it may establish itself on the free basis of art. It is consequently quite aware of the distinction and contrast implied in its self-creation to the world of prose.

(*β*) *Secondly*, the kind of *prose life*, from which poetry has to separate itself, postulates an entirely different nature of conception and speech.

(*αα*) In other words, looked at from one point of view, such a consciousness regards the wide expanse of reality according to that association of cause and effect, object and means, and all other categories of the mode of reflection which deals with *finite* conditions and the objective world generally, that is, the limited categories of science or the understanding. It is a feature of such thought that every particular trait should at one moment appear with a false subsistency, at another should be placed in the position of *bare* relation to something else, that as such it should be so apprehended in its relativity and dependence that no unity of a free nature whatever is possible, no unity, that is, which remains essentially throughout, and in all its branches and separate filaments, a complete and free totality, no unity, in short, where we find that the individual aspects are simply the appropriate explication and phenomenal presence of *one* content which constitutes the point of focus, the soul that unites all together, and which also finds its vital principle in this all-pervading centre of animation. Rather the type of conception we above refer to as that of science goes no

further than the discovery of particular laws in phenomena, and persists for this reason in the separation, or bare relation, of the particular existence with its general law, the laws themselves under this view tending to harden from each other in their isolate singularity; that their relation is, in fact, conceived exclusively under external and finite conditions.

(*ββ*) And, furthermore, man's *ordinary* consciousness has nothing to do with what we call the ideal principle of association, the essential core of facts, their bases, causes, ends, and so forth. It rests satisfied with the acceptance of the mere fact that something exists or happens as distinct from something else; or, in other words, with its insignificant contingency. It is no doubt true that the unity of life is not, in such a case, deliberately cancelled by any express separation; that unity, I mean, in which the intuition of the poet arrests the ideal *rationale* of the fact, its expression and determinate existence. What, however, is absent here, is just that flash of insight into this core of reason and significance, which becomes consequently for our intelligence a thing essentially vacant, possessing no further claim on our minds to a rational interest. The comprehension of a rational cosmos; and its relations is exchanged then and there for a mere flux and contiguity of indifference, which it is true may possess a large expanse of external animation, but which none the less suffers the profounder impulse of reason[4] to remain unsatisfied. True vision, no less than soul-life in its full vigour, can only obtain satisfaction, where such are made aware in phenomena, through feeling no less than contemplation, of the reality in its essence and truth which is compatible with such a world. The life which is a mere external show is defunct to our deeper sense, if all that is ideal and intrinsically rich in significance fails to shine through as the very soul thereof.

(*γγ*) These defects, thirdly, in the conceptions of science and our ordinary conscious life *speculative thought* effaces. It stands, therefore, in one respect in affinity with the imagination of the poet. The cognizance of reason[5] is not solely, or even mainly, concerned with contingent singularity, nor does it overlook in the phenomenal world the essence of the same. It does not rest satisfied with the differentiations and external relations proper to the conceptions and deductions of the understanding; it unites them in a free totality, which in the apprehension of our finite faculty in part fails to preserve its self-consistency, and in part is posited in a relation that possesses no synthetic unity. Pure thought, however, can have but one result, namely thoughts. It evaporates the mode of reality in that of the pure notion. And although it grasps and comprehends actual things in their essential separation and their actual existence, it does also nevertheless translate this particularity into the ideal element of the universal, in which alone thought is at home with itself. Consequently there arises, in contrast to the world of phenomena, a world that is new in this sense, that though the truth of the Real is present, it is not displayed in *reality* itself as the power itself which gives it form and the veritable soul thereof. Thinking is simply a reconciliation of truth with reality in *Thought.* The creations and reconstruction, however, of the poet is a reconciliation under the mode of phenomenal reality itself, albeit such a *real appearance* is merely ideally conceived.

(*γ*) We have, therefore, two distinct spheres of consciousness, that of poetry and prose. In former times, in which there is neither present a deliberate outlook on the world elaborated, in respect to its religious belief and its general knowledge, under the co-ordinated form of scientific ideas and cognition, nor an actual world of human condition regulated conformably to such a standard, poetry is confronted with a lighter task. Prose is not in such a case opposed to it as an essentially independent field

of ideal and external existence, which it has first to overcome. Its problem is for the most part simply limited to deepening all that is significant or transparent in the forms of ordinary consciousness. If, on the contrary, the prose of life has already appropriated within its mode of vision the entire content of conscious life, setting its seal on all and every part of it, the art of poetry is forced to undertake the task of melting all down again and re-coining the same anew. In every direction it finds itself involved in difficulties by the unresponsive nature of prosaic existence. It has, in short, not only to wrest itself from the adherence of ordinary consciousness to all that is indifferent and contingent, and to raise the scientific apprehension of the cosmos of fact to the level of reason's profounder penetration, or to translate speculative thought into terms of the imagination, giving a body to the same in the sphere of intelligence itself; it has further to convert in many ways the *mode of expression* common to the ordinary consciousness into that appropriate to poetry; and, despite of all deliberate intention enforced by such a contrast and such a process, to make it appear as though all such purpose was absent, preserving the original freedom essential to all art.

(*c*) We have now summarized in its most general terms that in which the content of poetry consists. We have further distinguished the form of poetry from that of prose. In conclusion, it is of importance to draw attention to the particularization which the art of poetry, to a degree unattained by the other arts, whose development is not nearly so rich in results, admits of. We find, no doubt, architecture illustrated in the arts of very varied peoples, and continuous through many centuries. But of sculpture, at least, it is true that it reaches its culminating point in the ancient world of Greece and Rome, just as painting and music have done more recently in Christendom. The art of poetry celebrates its epochs of brilliancy and bloom among all nations and in all ages almost that present any real artistic activity at all. It

embraces the collective Spirit of mankind, and it is differentiated through every kind of variation.

(*α*) Furthermore, inasmuch as poetry does not accept the universal in scientific abstraction from its object, but seeks to represent what is rational under the mode of individuality,[6] the specific traits of national character are essential to its growth; the content and the particular mode of its presentation are in fact conditioned by the nature of these and the general outlook in each case. We find it consequently adapting itself to every variety of form and peculiarity. It matters not what the poetry may be, whether Oriental, Italian, Spanish, English, Roman, Hellenic, or German, each and all differ totally in their spirit, emotional impulse, general outlook and expression.

A similar distinctive variety asserts itself in particular epochs as they are favourable to the art of poetry or the reverse. The results secured, for example, by our German poetry were impossible in the Middle Ages, or the times of the thirty years' war. The particular motives, which in our own day excite the greatest interest, are inseparable from the entire evolution of contemporary life. And in the same way every age has its own wider or more restricted, more exalted and liberal, or more depressed phase of emotional life, in short its specific outlook on the world, which it is the express aim of poetry to bring home to the artistic consciousness in the most intelligible and complete manner, inasmuch as language is the one medium capable of expressing the human spirit wherever and in whatever form it may be manifested.

(*β*) Among these national characteristics, or views and opinions peculiar to particular epochs, some have closer affinity with the poetic impulse than others. The Oriental consciousness is, for example, in general more poetic than the Western mind, if we exclude Greece. In the East the principle predominant is always that of coherence, solidity, unity, substance. An

outlook of this nature is intrinsically most penetrative, even though it may fail to reach the freedom of the Ideal. Our Western point of view, especially that of modern life, is based on the endless breaking up and division of its boundless material into fragments, in virtue of which process, the extreme emphasis laid here on particular facts, what is merely finite becomes substantive for the imagination, and despite of this must be once more subsumed under the converse action of relativity. For the Oriental nothing persists as really substantive, but everything appears as contingent, discovering its supreme focus, stability and final justification in the One, the Absolute, to which it is referred.

(γ) By means of this diversity of national traits and the evolutionary process of the centuries we find that what is shared by all mankind alike, no less than all that claims to be artistic, is drawn as a common element within the reach of other nations and epochs, intelligible and enjoyable to the same. It is in this twofold connection that of late years to an exceptional degree Hellenic poetry has roused the admiration and imitation of most diverse nationalities. And this is so because in the content of it no less than in the artistic form it receives the simply human is disclosed with most beauty. The literature of India itself, however, despite all the difficulties attendant on an outlook and artistic expression so alien to our own, is not wholly outside our sympathy; and the boast is no empty one that in our modern era pre-eminently a keen sense for all that art and the human spirit embraces in every direction has begun to unfold itself.

Were we in our present investigation of this impulse toward individualization, pursued so persistently by poetry, under the aspects we have already described, to restrict the same to a *general* treatment of the art of poetry, such a generalization, however established, could not fail to be abstract and devoid of content. It is therefore of first importance, if our object be to consider poetry of a really genuine type, that we include in our

survey the forms of the creative spirit as presented in their national form, the unique product of one age; and further we must not overlook the individuality which creates, the soul of the poet. Such, then, are the main points of view to which I would draw attention by way of a general introduction to poetical creation and conception.

2. THE ART-PRODUCT OF POETRY AND PROSE

Poetry is not, however, exhausted by the imaginative idea alone: it must necessarily proceed to make itself articulate and complete in the *poetical work of art.*

Such an object of study opens a large field of investigation. We may conveniently arrange and classify the course of our discussion as follows:

First, we shall endeavour to point out what is of most importance relatively to the *poetical composition generally.*

Secondly, we shall distinguish it from the principal types of *prose composition*, in so far as the same are compatible with artistic treatment.

We shall then, *finally* be in a position to deduce with some completeness the notion of the *free art-product.*

(*a*) In respect to the poetical work of art under its generic aspect all that is necessary is once more to enforce our previous contention that it must, no less than any other production of an unfettered imagination, receive the form and independence of an organic whole. This demand can only receive satisfaction as follows:

(*α*) In the *first* place that which constitutes a homogeneous content, whether it be a definite object of action and event, or a specific emotion and passion, must before everything else possess intrinsic unity.

(*αα*) All else must be posited under relation to this bond of unity, and thereby combine to form a freehand concrete coherence of all parts. This is

only possible under the condition, that the content selected is not conceived as abstract *universal*, but as the action and emotion of men, as the object and passion which are actually present in the mind, soul, and volition of definite individuals, arising as such from the distinctive basis of an individual nature in each case.

(*ββ*) The universal, which is to receive representation, and the individuals, in whose character events and actions the manifestation of poetry is asserted must not consequently fall into fragments, or be so related that the individuals are merely of service as an abstract universal; both aspects must combine in vital coalescence. In the Iliad, for example, the contest of Greeks and Trojans, and the victory of the former is inseparably bound up with the wrath of Achilles, which for this reason becomes the common focus welding all together. No doubt we also find poetical works in which the fundamental content is partly more abstract in its generalization, and also partly is executed in a way that expresses a universal of more significance. Dante's great epic poem is an illustration, which not only embraces the world divine throughout, but displays individuals of the most varied character in their relation to the punishments of hell, purgatory and the blessedness of Paradise. But even here we find no entirely abstract separation, of the two points of view, no mere relation of service between the particular objects. For in the Christian world the focus of conscious life is not conceived as nothing more than an accident of Godhead, but as essential and infinite cause or end itself, so that here the universal purpose, that is the divine justice in condemnation and salvation can verily appear as immanent fact, the eternal interest and being of the individual himself. In this divine world the individual is throughout of pre-eminent importance. In that of the State he can of course be sacrificed in order to save the universal, that is the State. In his relation to God, however, and in the kingdom of God he is essentially and exclusively the end.

(*γγ*) We must, however, *thirdly*, conceive the universal, which supplies the content of human emotion and action as self-subsistent, intrinsically complete where it is, and constituting as such in itself a definitive and exclusive world. When, for instance, in our contemporary life mention is made of any officer, official, general, professor, and so forth, and we try to imagine what kind of action such a man or personality is likely to attempt or carry out under his own particular conditions of environment, we place before ourselves simply a content of interest and activity, which in part is not itself a rounded and self-substantive whole, but one which stands in infinitely manifold external connections, relations and conditions, in part also, if we regard it as abstract totality, one which can receive the form of a universal concept in its separation from the individuality of the, in other respects, entire personality, as for instance that of personal obligation. Conversely we may have no doubt a content of sterling character, making, that is to say, an essentially independent whole, which, despite of this, and without further development and advance, is complete in one sentence. It is really impossible to say whether a content of this nature belongs more properly to poetry or prose. The grand affirmation of the old Testament, “God said Let their be Light and there was Light,” is at once in its penetration, no less than the precision of its embrace,[7] as much essentially sublime poetry as it is ordinary prose. Of a similar nature is the command, “I am the Lord thy God, thou shalt have no other gods but me”; or that, “Honour thy father and thy mother.” The golden epigrams of a Pythagoras and the wise sayings of Solomon are of the same type. Phrases, so rich in content as the above, have their origin in a world where the distinction between poetry and prose is as yet absent. We can, however, hardly affirm of such that they are a poetical work of art, even though many such phrases may be combined together. The independence and rounding off of a genuine poetical work must be assumed at the same time to be of the nature of a

process, and a differentiation of parts: we assume it therefore to be a unity, the true character of which is only made explicit by emphatic insistence upon its diversity. This process, absolutely essential in the plastic arts, regarded at least according to the requirements of their form, is also more generally of the greatest moment in a poetical composition.

(*β*) This introduces us, then, to a *second* feature of the work of art, namely, the organic differentiation of its several parts, essential to it not merely that it may be presented as an organic unity, but that the elaboration of all it implies may be rendered complete.

(*αα*) The most obvious reason of this necessity is referable to the fact that Art in general tends instinctively to particularization. The effect of the scientific faculty is that what is particular and singular fails to receive its complete vindication. And this is so not merely because the understanding apprehends the manifold, as such theoretic faculty, starting from its principles of generalization, causing the particular fact thereby to evaporate in its abstract deductions and categories; but also because it makes this manifold subserve ends of purely practical import. Severe adherence to that purely relative value, which strictly belongs to the nature of the process, appears to the understanding as useless and tedious. To the conception and composition of poetry on the contrary every part, every phase in the result must remain of essential interest and vital. It dallies therefore with delight in detail, depicts the same with enthusiasm, and treats every part as an independent whole. However great, therefore, in addition the content may be of a poetical work in its central interest, the organic completeness is equally asserted in subordinate detail, precisely as in the human organism every member, every finger is rounded with exquisite delicacy in its unified completeness, and as a rule, we find in Nature that every particular existence is enclosed within a perfect world of its own. The advance of poetry is therefore more slow than that compatible with the judgments and

conclusions of the understanding, where we find that, whether regarded theoretically as science or with reference to practical conduct and action, the main stress is on the final result, this rather than on the path by which it is reached. As for the degree in which poetry approaches realization in its tenderness for such detail we have already pointed out that it is not its vocation to describe with excessive diffuseness what is exterior in the form of its sensuous appearance. If it therefore undertakes extensive descriptions without making them reflect at the same time the claims and interests of soul-life it becomes heavy and tedious. Above all it must take care not to enter into deliberate rivalry with the actual detail, in its exact completeness, presented by natural fact itself. Even painting in this respect should aim at circumspection and restriction. We have therefore here and in the case of poetry a twofold point of view to consider. On the one hand we must remember that the impression is on our mental vision; and on the other the art can only place before the mind the object, which in Nature we can survey and comprehend in a single glance in a series of separate traits. For this reason it is important that poetry does not carry its elaboration of detail so far, that the vision of the whole in its entirety becomes inevitably disturbed, confused, or lost. It is obvious therefore that difficulties of an exceptional nature have to be overcome when the attempt is made to place an action or event of varied nature before our vision, and where in actual life such happen in a single moment of time, and in close connection with such immediacy, for all it can do is to present the same in a continuous series. As respects this difficulty, no less than the general way in which poetry, as already described, approaches the detail of Nature, we find the demand of the several generic types of the art differs very considerably. Epic poetry, for instance, attaches itself to the particularity of the external world with an emphasis totally different from that of dramatic poetry, with

its rapidity of forward movement, or from that of lyrical poetry with its exclusive insistence on the ideally significant.

(*ββ*) It is through an elaboration of this kind that the several parts of a composition secure *subsistency.* No doubt this appears to stand in direct contradiction to the unity which we established as a primary condition: as a matter of fact the opposition is merely apparent. This independence should not, that is to say, assert itself in such a way that the several parts are placed in absolute separation from each other: it must on the contrary only be carried so far that the several aspects and members of the whole are clearly seen on their own account to be asserted in the vital form peculiar to each, and to stand on their own free basis of independence. If, on the contrary, this individualized life is absent from the several parts, the composition becomes, precisely as Art generally can only invest the universal with determinate existence under the form of actual particularity, cold and defunct.

(*γγ*) Despite of this self-subsistency, however, these several parts must remain likewise in conjunction to the extent that the *one* fundamental motive or purpose, made explicit and manifest in and through them, must declare itself as the unity which pervades the whole, and in which the parts coalesce and to which they return. This is the condition of art, and pre-eminently so of poetry, where it falls short of its noblest reach, upon which it most readily is wrecked, and the work of art declines from the realm of a free imagination into that of mere prose. To put it in another way, the connexion into which the parts fall must not merely be one of final *cause and effect.* For in the relation of teleology the end is the universal as essentially presupposed and willed, which it is true succeeds in making the several aspects tally with the process, yet employs them none the less as means and to this extent robs them of all really free stability and thereby of every sort of vitality. In such a case the parts merely fall under a relation of

purpose to one end, which is asserted imperiously to the disadvantage of all else, and which accepts the same in abstraction as subservient and subordinate to itself. The freedom and beauty of art contradict flatly this servile relation of the abstract faculty of science.

(*γ*) On these grounds the unity, asserted in the several parts of the composition, must be of another character. The definition of this may be stated under two aspects of conception, as follows.

(*αα*) In the *first* place, the vital presence we have already referred to as peculiar to every part separately must be maintained. If we direct our attention, however, to that which in fact justifies the introduction of any detail whatever into the composition, we find the point of departure to be *one* fundamental idea which the same as a whole is undertaken to manifest or interpret. Consequently everything defined and particular must announce that as the source of its own specific appearance. In other words, the content of a poetical work must not be itself intrinsically abstract, but concrete, one that by reason of its own wealth conducts us to a rich unravelment of its varied aspects. And when this variety, even assuming that in its realization it falls to every appearance into plain contradictions, yet is as a matter of fact rooted in the essentially unified content we have adverted to, in that case we may affirm that by necessity the content itself, in a form agreeable to its notion and being, comprises what is fundamentally an exclusive and harmonious totality of particular characteristics, which it possesses as its own, and in the continuous expatiation of which what it is in its real significance is in truth rendered explicit. It is only *these* several parts, which originally belong to the content, and which consequently should be carried into the composition under the mode of actual and essentially sound and vital existence. In this respect, therefore, despite all appearance the display of particular characteristics present of opposition to others, they are

throughout combined in a union of mysterious accord, rooted in its own nature.

(*ββ*) *Secondly,* since the composition is presented under the form of *natural* phenomena, the unity must, in order to preserve the vital appearance of such reality, only be the *ideal* bond, which to all appearance without intention holds together the parts and includes them in an organic whole. It is just this animating union of organic life which alone is able to bring into being true poetry as contrasted with the expressed intention of plain prose. That is to say whenever particularity exclusively appears as means to a definite end, it does not possess and cannot conceivably possess an independent and unique vitality of its own; what it does testify to, on the contrary, is that it exists for the sake of something else, that is the end proposed. Purpose of this type declares its sovereignty over the objective facts through which it is fulfilled. An artistic composition should, however, confer upon all that is particular within it, all in the expatiation of which it displays continuously the central and fundamental content selected, the appearance of an unfettered stability. This is absolutely necessary, because what we here comprise under the term particularity is just that content itself under the mode of the reality which corresponds with it. We may therefore recall to our minds the analogous task of speculative thought, which in the same way has on the one side to develop the particular to the point of self-subsistency or freedom from that which is at first an indefinite universality; and likewise, too, it is called on to demonstrate how within this totality of what is particular, in which that and that only is divulged which essentially reposes in the universal, the unity is on this very account once more asserted, and indeed then and only then is truly concrete unity, established through its own differences and their mediation. Speculative philosophy is thus, in the same way, through the method of dialectic above adverted to, responsible for works which resemble in this respect those of poetry,

containing, that is, by virtue of the content, an essential identity of self-seclusiveness and a revelation of differentiated material in accord with it. We must, however, despite this similarity between these two activities, and apart from the obvious difference between the evolution of pure thinking and creative art, draw attention to a further essential distinction. The deduction of philosophy no doubt vindicates the necessity and actuality of particularity, but none the less, in virtue of the dialectic process in which this aspect of reality is asserted, it is expressly demonstrated of this particularity and all of it, that it for the first time discovers its truth and its stability in the concrete unity.[8] Poetry, on the contrary, does not proceed to any such express demonstration. The concordant unity must no doubt be completely vindicated in every one of its creations, and be operative there in all their manifold detail as the soul and vital core of the whole; but this presence remains for Art an ideal bond which is implied rather than expressly posited, precisely as the soul is immediately made vital in all the bodily members, without robbing the same of the appearance of an independent existence. We have the same truth illustrated by colour and tone. Yellow, blue, green and red are different colours which admit of the most absolute contrast; but none the less, on account of the fact that as colour they all essentially belong to one totality, they maintain a harmony throughout; and it is not, moreover, necessary that this union as such should be expressly declared in them. In a similar way the dominant, the third and the fifth remain independent as tones, and yet for all that give us the harmony of the trichord; or, rather, we should put it that they only produce this harmony so long as each tone is permitted to assert its own essentially free and characteristic sound.

(*γγ*) In connection with this organic unity and articulate synthesis of a poetical composition we have further to consider essential *features of distinction* which are due to the particular *artistic form* appropriate to the

composition under review, no less than the particular *type* of poetry in which we discover the specific character of its working out. Poetry, for example, of symbolic art is unable, owing to the more abstract and indefinite traits which constitute its essential and significant content, to attain to a fully organic fusion in the degree of transparency possible to the works of the classical art-form. In symbolism generally, as we have already established in the first part of this enquiry, the conjunction of general significance and the actual phenomenon, in association with which Art embodies its content, is of a less coherent character: as a result of this we find that what is particular in one direction preserves a greater consistency; in another, as in the case of the Sublime, only so far asserts this quality in order, through the negation thus implied, to render more intelligible the *one* supreme power and substance, or merely to advance the process to a condition of mysterious association of particular, but at the same time heterogeneous no less than related traits and aspects of natural and spiritual facts. Conversely, in the romantic type, wherein the ideality of truth reveals itself in essential privacy to soul-life only, we find a wider field for the display of the detail of rational reality in its self-subsistency; in this latter case the conjunction of all parts and their union must necessarily be present, but the nature of their elaboration can neither be so clear or secure as in the products of classical art.

In a similar way the Epic gives us a more extensive picture of the external world; it even lingers by the way in episodical events and deeds, whereby the unity of the whole, owing to this increased isolation of the parts, appears to suffer diminution. The drama, in contrast to this, requires a more strenuous conjunction, albeit, even in the drama, we find that romantic poetry permits the introduction of a type of variety in the nature of episode and an elaborate analysis of characteristic traits in its presentation of soul-life no less than that of external fact. Lyric poetry, as it changes

conformably to the fluctuation of its types, adapts itself to a mode of presentment of the greatest variety: at one time it is bare narration; at another the exclusive expression of emotion or contemplation; at another it restricts its vision, in more tranquil advance, to the central unity which combines; at another it shifts hither and thither in unrestrained passion through a range of ideas and emotions apparently destitute of any unity at all.

This, then, must suffice us on the general question of a poetical composition.

(*b*) In order now, — this is our *second* main head in the present discussion, — to examine more closely the distinction which obtains between the organic poem as above considered and the prose composition, we propose to direct attention to those specific types of *prose* which, despite their obvious limitations, do none the less come into closest affinity with art. Such are, without question, the arts of history and oratory.

(*α*) As regards history, there can be no doubt that we find ample opportunity here for *one* aspect of genuine artistic activity.

(*αα*) The evolution of human life in religion and civil society, the events and destinies of the most famous individuals and peoples, who have given emphasis to life in either field by their activity, all this presupposes great ends in the compilation of such a work, or the complete failure of what it implies. The historical relation of subjects and a content such as these admits of real distinction, thoroughness and interest: and however much our historian must endeavour to reproduce actual historical fact, it is none the less incumbent upon him to bring before our imaginative vision this motley content of events and characters, to create anew and make vivid the same to our intelligence with his own genius.[9] In the creation of such a memorial he must, moreover, not rest satisfied with the bare letter of particular fact; he must bring this material into a co-ordinated and constructive whole; he must

collectively conceive and embrace single traits, occurrences and actions under the unifying concept; with the result that on the one hand we have flashed before us a clear picture of nationality, epoch of time, external condition and the spiritual greatness or weakness of the individuals concerned in the very life and characterization which belonged to them; and on the other that the bond of association, in which the various parts of our picture stand to the ideal historical significance of a people or an event, is asserted from such without exception. It is in this sense that we, even in our own day, speak of the art of Herodotus, Thucydides, Xenophon, Tacitus, and a few others, and cannot cease to admire their narratives as classical products of the art of human language.

(*ββ*) It is nevertheless true that even these fine examples of historical composition do not belong to free Art. We may add that we should have no poetry even though we were to assume with such works the external form of poetry, the measure or rhyme of verse and so forth. It is not exclusively the manner in which history is written, but the nature of its *content*, which makes it prose. Let us look at this rather more closely.

Genuine history, both in respect to aim and performance, only begins at the point where the heroic age, which in its origination it is the part of poetry and art to vindicate, ceases, for the reason that we have here the moment when the distinct outlines and prose of life, in its actual conditions, no less than the way they are conceived and represented, come into being. Herodotus does not for instance describe the Greek expedition to Troy, but the Persian wars, and takes pains, in a variety of ways, with tedious research and careful reflection, to base the narrative proposed on genuine knowledge. The Hindoos, indeed we may say the Orientals generally, with almost the single exception of the Chinese, do not possess this instinct of prose sufficiently to produce a genuine history. They invariably digress either into an interpretation and reconstruction of facts of a purely religious

character, or such as are fantastic inventions. The element of prose then native to the historical age of any folk may be briefly described as follows.

In the *first* place, in order that we may have history we must presuppose a common life, whether we consider the same on its religious side, or that of a polity, with its law, institutions, and the like, established on their own account, and possessing originally or in their subsequent modification a validity as laws or conditions of general application.

It is out of such a common life, *secondly*, that we mark the birth of definite activities for the preservation or change of the same, which may be of universal import, and in fact constitute the end or motive of their continuance, and to complete and carry into effect which we have to presuppose individuals fitted for such a task. These individuals are great and eminent in so far as they show themselves, through their effective personality, in co-operation with the common end, which underlies the ideal notion of the conditions which confront them: they are little when they fail to rise in stature to the demand thus made on their energy: they are depraved when, instead of facing as combatants of the practical needs of the times,[10] they are content merely to give free rein to an individual force which is, with its implied caprice, foreign to all such common ends. Where, however, any of such conditions obtain we do not have either a genuine content or a condition of the world such as we established in the first part of our inquiry as essential to the art of poetry. Even in the case of personal greatness the substantive aim of its devotion is to a large or less extent something given, presupposed, and enforced upon it, and to that extent the unity of individuality is excluded, wherein the universal, that is the entire personality should be selfidentical, an end exclusively for itself, an independent whole in short. For however much these individuals discover their aims in their own resources, it is for all that not the freedom or lack of it in their souls and intelligence, in other words the vital manifestation of

their personality, but the accomplished end, and its result as operative upon the actual world already there, and essentially independent of such individuality, which constitutes the object of history. And, moreover, from a further point of view we find manifested in the historical condition the play of contingency, that breach between what is implicitly substantive and the relativity of particular events and occurrences, no less than of the specific subjectivity of characters displayed in their personal passions, opinions and fortunes, which in this prosaic mode of life present far more eccentricity and variation than do the wonders of poetry, which through all diversity must remain constant to what is valid in all times and places.

And *finally*, in respect to the actual execution of affairs within the cognisance of history we find here again the introduction of a prosaic element, if we contrast it with the impulse of genuine poetry, partly in the division asserted by personal idiosyncracy from a consciousness of laws, principles, maxims and so forth, which is thereby necessarily absorbed in the universal condition or fact; and in part also the realization of the ends proposed involve much preparation and arrangement, the means to effect which extend far, and embrace many necessary or subservient relations, which have to be readjusted and adapted, in order to carry out the course proposed, with intelligence, prudence and prosaic circumspection. The work in short cannot be undertaken offhand, but only to a large extent after extensive introduction. The result of this is that the particular acts of execution, which, it is here assumed, come into effect for the *one* main purpose, are often either wholly contingent in respect to their content, and remain without ideal union, or are asserted under the form of a practical utility regulated by a mind dominated by the aims proposed; in other words, they do not proceed unmediated from the core of free and independent life itself.[11]

(*γγ*) The historian then has no right to expunge these prosaic characteristics of his content, or to convert them into others more *poetical;* his narrative must embrace what lies actually before him and in the shape he finds it without amplification,[12] or at least poetical transformation. However much, therefore, it may become a part of his labours to make the ideal significance and spirit of an epoch, a people, or the particular event depicted, the ideal focus and bond which holds all together in one coherent whole, he is not entitled to make either the conditions presented him, the characters or events, wholly subordinate to such a purpose, though he may doubtless remove from his survey what is wholly contingent and without serious significance; he must, in short, permit them to appear in all their objective contingency, dependence and mysterious caprice. No doubt in biography the full animation of personality and an independent unity is conceivably possible, because in such a work the individual, no less than all which proceeds from him and is operative in moulding such a figure, is throughout the focus of the composition. A historical character is, however, exclusively one of two opposed extremes. For although we deduce a unity of subject from the same, none the less from another point of view various events and transactions obtrude, which in part are without any essential ideal connection, and in part come into contact with such individuality without any free co-operation on the part of the same, and to this extent involve the same within the contingency of such an external condition. So, for example, Alexander is without question a personality, pre-eminent above all others of his epoch, and one which, in virtue of its unique forces, falling as they do in accord with contemporary world conditions, becomes engaged in the Persian invasion. The continent of Asia none the less, which Alexander vanquishes, is in the capricious variety of its nationalities a whole united by no necessary bond.[13] Historical events pass before him as the bare panorama of purely objective phenomena. And, finally, if the

historian adds to his survey his private reflections as a philosopher, attempting thereby to grasp the absolute grounds for such events, rising to the sphere of that divine being, before which all that is contingent vanishes and a loftier mode of necessity is unveiled, he is none the less debarred, in reference to the actual conformation of events, from that exclusive right of poetry, namely, to accept this substantive resolution as the fact of most importance. To poetry alone is the liberty permitted to dispose without restriction of the material submitted in such a way that it becomes, even regarded on the side of external condition, conformable with ideal truth.

(*β*) *Secondly*, *oratory* appears to have a closer affinity with the freedom of art.

(*αα*) For although the orator avails himself of the opportunity for and content of his effort out of actual life and definite circumstances and opinions, all that he utters remains none the less, in the *first* place, subject to his free choice. His personal aims and views are immanent therein, in virtue of which he can make the same a complete and living expression of his personality. And, *secondly*, the development of the subject of his oration and the mode of delivery depends entirely on himself, so that the impression he makes is as though we received in his speech a wholly independent expression of mind. And, *finally*, it is his vocation not merely to address himself to the trained or ordinary intelligence of his hearers, but to work upon their entire humanity, their emotions, no less than their judgment. The substance of what he has to say and in which he strives to awake interest, is not merely the abstract aspect of it, nor is it this aspect of his main purpose, in the fulfilment of which he invites co-operation, but rather for the most part also a definite and very real thing. For this reason the substance of the orator's address, while embracing what is essentially substantive in its character, ought equally to grasp his general principle under the form of its specific manifestation, and render the same intelligible

to conscious life in the full concrete sense of the term. The orator then must not merely satisfy our understanding with the cogency of his deductions and conclusions, but has it in his power to address the soul itself, to rouse human passion and carry it captive, to absorb the whole attention, and by such means, through all the avenues of spirit, to ravish and convince his audience.

(*ββ*) Despite, however, such considerations, looked at rightly we find that it is just in the arts of oratory that this apparent freedom is almost wholly subordinate to the rule of practical *utility*. In other words what confers upon public speaking its unique motive force is not implied in the particular purpose, to promote which the speech is made; we must refer it to the general principle, the laws, rules, axioms which the particular case suggests, and which are already essentially present in this form of universality, partly, as actual laws of the State, partly too as ethical, juristic or religious maxims, emotions, dogmas, and so forth. The particular circumstance and end, which we find here as the point of departure, and this universal are in every respect separate from each other, and this separation is the relation maintained throughout. No doubt the orator intends to make these two aspects unite: what, however, in poetry, in so far as poetry is really present, attests as already from the first accomplished, is present in oratory merely as the personal aim of the orator, the fulfilment of which lies outside the speech itself altogether.

The only alternative we have left us is a process of *subsumation*, whereby the phenomenon, the actual and defined thing, here the concrete case or end, is not unravelled in immediate unity with the universal as such, and freely from its own substance, but only receives validity by virtue of its dependence upon general principles and in its relation to legislative acts, morality, customs, and the like, which on their own account possess

independent stability. It is not the spontaneous life of the fact in its concrete manifestation, but the prosaic division between notion and reality, a mere relation of both to each other and a mere demand for their union, which constitutes the fundamental type under consideration.

Such a process of thought is frequently adopted by the religious teacher. For him religious doctrines, in their widest connotation, and the principles of morality or of philosophy, political or otherwise, which follow in their train, are in fact precisely the object whereto he can refer cases of every conceivable variety; and they are this for the reason that these doctrines have to be accepted, believed and recognized by the religious consciousness as essentially and in their own worth the substance of all particular appearance. No doubt the preacher may at the same time appeal to our heart, may suffer the divine laws to unveil from the depth of soul-life as their source, and face to face with his audience may refer them to such a source. But it is not in their absolutely individual guise that he must necessarily present and assert them; on the contrary, he must bring effective universality to consciousness under precisely this form of commands, promises and maxims of faith. The oratory of courts of law is even a better illustration. Here we find in addition the twofold point of view, that while on the one hand all turns most obviously on the particular case, yet conversely the subsumation of this case to general considerations and laws is equally a necessity. As regards the *first* aspect, we may remark that the element of prose is already implied in the enforced investigation of the actual facts and the collocation and able reconstruction of all singular circumstances and accidents; a process such as this at once opens our eyes to the poverty involved in this investigation of the truth of such a legal case, no less than the tedious ingenuity engaged in its display, if we contrast it at least with the free creations of poetry. We have in fact to carry our analysis of the concrete facts to a yet further point. Such must not merely be traced

in a series that does justice to all features, but every one of such features, no less than the whole case, have to be referred back to the statute accepted from the first as of independent validity. At the same time, even in this prosaic affair, we still have considerable scope for an impression on the heart and emotions. For it is possible so to present the rightness or wrongness of the case under discussion to the imagination that we are no longer bound to acquiesce in the bare knowledge of the facts and a general conviction; on the contrary, the case in its entirety is capable of becoming, by virtue of the style adopted in its exposition, so marked with the characteristics of personality to everyone who hears it, that no one can fail to discover there a personal interest as of something which concerns himself.

Secondly, in the oratorical art, artistic delivery and elaboration is not that which constitutes the ultimate and highest interest of the speaker; he possesses in addition and beyond his art an ulterior aim, that the entire form and working out of his discourse should rather be used exclusively as the most effective means to promote an interest which is outside. From this point of view the audience too have to be influenced not on their own independent account, but the effort is rather to excite emotion and conviction exclusively as a means toward the attainment of the purpose, the fulfilment whereof the orator has proposed from the first. The mode of presentation, therefore, ceases to be an end for itself even to the listener; its claim becomes exclusively that of a means to some particular conviction, or an incentive to definite conclusions or activities.

For these reasons from this point of view also the art loses its freedom of form; it becomes a means to a purpose, to a further demand,[14] which, this is a *third* point, in relation to the *consequence*, is not satisfied in the actual speech itself and its artistic handling. The composition of poetry on the contrary has no other object than the manifestation and enjoyment of

beauty. End and accomplishment reposes here immediately and essentially in the independent work, which for that reason is complete; artistic activity is no means to an essentially ulterior result, but an end which at once is rounded in itself by virtue of its own execution. In oratory art receives merely a position of service to something collateral; the genuine end is therefore not as such consonant with art, but of a practical character, that is to say, instruction, edification, judgment of legal matters or political affairs, and therewith a reference to some matter which has first to happen, or to a decision not yet carried out, but which, however, are in neither case terminated or completed through the resultant effect of the art in question, but can only be so in various ways after a contact with quite other activities. A speech in fact may often conclude with a dissonance, which the hearer has first to resolve as judge, and only then is able to act agreeably with such a verdict. Just as, for example, the oratory of the pulpit starts from the point of the unconverted soul, and in the result makes the hearer pass judgment over his own self and his soul's condition. In such a case religious conversion is the object of the preacher; but whether such a conversion follows as a result of all the edification and excellence of his eloquent exhortations, and thus the end proposed is carried out, is a point of view which the sermon itself cannot deal with; it must be perforce relegated to subsequent conditions.

(*γγ*) In all these directions the notion of eloquence will fall rather under the main principle of utility than maintain itself within the free and organized whole of the poetical art-product. In short the orator must necessarily and above all make it his mark to subordinate the whole, no less than the parts, to that purpose in his mind, from which his effort proceeds, a process in which the self-consistent independence of his exposition disappears, and in lieu of which we must assume a relation of service to a definite end that ceases to be of artistic significance. And above all,

inasmuch as the object in view is one of practical influence upon human life, he must keep throughout before his mind the nature of the place in which he speaks, the degree of education, the receptive powers, and, in short, the general atmosphere of his audience, that he may not fall short of the practical success desired through an inability to meet the local conditions of the moment, and the idiosyncrasies of his audience. By reason of this very attachment to external conditions it is impossible that either the entirety of his address or its parts can any longer originate in a free artistic activity;[15] it will constantly tend in its detailed elaboration to appropriate utilitarian points of association, and be dominated by conceptions of cause and effect, and other categories more proper to science.

(*c*) And, *thirdly*, we may, as flowing from the above distinction between what is really poetical and the creations of the historian and the orator, establish the following points pertinent to the poetical composition itself.

(*α*) We found that in history the element of prose consisted above all in this that however much the content thereof could be ideally substantive and possessed of a downright penetrative power, the actual form of the same was, however, invariably accompanied with many conditions of relative validity, massed together with much that was contingent, and finally often referable to caprice simply as its ground, aspects of immediate objective fact which the historian was not entitled to translate into the terms of a reality of profounder grasp.

(*αα*) The effort of such a transfiguration is in fact a fundamental *desideratum* of the poetical art when it, so far as its material is concerned, steps into the arena of history. It is its business in short in such a case to discover the mere ideal core and significance of an event, action, or a national type, a famous historical personality, and as decisively to brush aside aspects of contingency, everything in fact purely incidental or

indifferent, which plays round such types or individuals, and stands to them in a purely relative connection. It has then to establish, in the place of the circumstances and traits it rejects, others which reveal the ideal essence of the facts in their clarity, to the intent that in this transfigured presence such shall so discover concrete truth in its fulness that the reason, which has hitherto lain concealed, though implied in them, shall now for the first time assert itself as evolved and declared in complete realization. By this means alone poetry is able in the proposed work to make its content coalesce in the secure unity of a centre, able as such to round and unfold itself in a whole. And this is possible because it not only is operative as a more effective bond between the parts, but also because, without compromising the unity of the whole, all its varied particularity is suffered to assert its claim to an independent impression.

(*ββ*) Poetry may in this respect make a yet further advance, when, it accepts as its main content, in lieu of the material and significance of the historical fact, some fundamental idea, some human collision in general associated with it in a close or more remote affinity, and employs the historical *factum* and personages, everything local in short, merely in the guise or garment of individualization. The difficulty to be encountered here is twofold: either the historically ascertained data, when appropriated by the composition, may fall out of line with the fundamental idea; or, conversely, it may be that the poet in some measure retains these data, but also too in essential features moulds them conformably to his purposes, and by doing this work fails to harmonize the element of stability with that of original design which were both essential to our conception of the poetical product. To dispel such an opposition and to reassert the accordant note able to do this is a difficult matter; it is none the less necessary, for objective reality has itself too an unquestionable title to what is essential in the character of its appearance.

(*γγ*) We may extend the reach of poetry yet further and we shall still find that the demand to be met is the same. In other words, all that the art of poetry represents in external local condition, characterization, actions, passions, situations, conflicts, events, and human destiny, all this material is borrowed, far more so in fact than is generally credited, from the facts of life itself. This being so, poetry here too is on the historical arena; and, consequently, its deviations or variations of such data must, in this field also, find their point of departure in the rational core of the facts in question and the demand of the art to discover for this ideal essence a form that exhibits it with greatest adequacy and life. And this must not be sought for in the poverty of a superficial knowledge, an inability to penetrate what is really vital in fact, or in the moods of caprice and with the craving after the quaint or perverse ingenuities of a spurious originality.

(*β*) And further, as already stated, oratory is allied to prose on account of the practical end which is thereby proposed, and, to carry out which, it is forced to admit to the full the claims of utility.

(*αα*) In this respect poetry must take care to detach itself from any end of this kind outside Art's domain, and the claim of artistic enjoyment simply; that it may not fall into the sphere of prose. For if any purpose of this sort is made to appear of essential importance, as part of the entire conception and presentation, the composition at once descends from that loftier region, in whose free atmosphere it floats on its own account and on no other, and is drawn into that of relation merely. As a result of this we have either a breach made between the fundamental aim of art and the ends of ulterior intendments; or art is used as a means simply, contradicts its substantive notion, and becomes the menial of utility. The edifying effusions of many church hymns are of this character. Particular ideas are simply admitted on religious grounds, and receive a style of composition which is alien to the beauty of poetry. And, speaking generally, poetry, simply as poetry, has no

right to edify in a *religious* sense, or at least *exclusively* in this sense. If it does so we are carried into a region, which no doubt possesses relationship with both poetry and art, but is for all that distinct from it. We may say the same of teaching generally, ethical instruction, political treatises, or writings of all kinds written for our momentary recreation and enjoyment. All these are objects, to whose attainment the art of poetry is, or can be more than any other, contributory. But such contributions must not enter into the purpose, if the spirit of the work is to assert itself freely in its own character. In the poetical effort it is only what is really poetic, eliminated from all that is foreign to this quality, which must remain paramount as the end proposed and accomplished. And in fact such ulterior aims as the above can be carried out far more appropriately by quite other means.

(*ββ*) The art of poetry, however, from the converse point of view, should strive to assert no absolute and isolated position; it ought, as a part of life itself, to enter freely into life. Already in the first part of this inquiry we found how many points of contact there were between art and ordinary existence, whose content and phenomenal appearance are repeated in its content and form. In poetry this vital relation to actual existence and its specific circumstances, private or public events, appears with most obvious variety in the so-called *poems d'occasion.* With a broader interpretation of the expression we may define as such most poetic compositions; in the more narrow and correct meaning of the term, however, we should restrict it to those productions whose origin is traceable to a single event of present time, which it is the express aim of the poet to emphasize, adorn, and celebrate. In this weaving together of the actual threads of life, however, poetry tends once more to decline to a position of dependence; it is therefore by no means unusual for writers on aesthetic to attach a purely subordinate value to poetry of this class in general, although as to a part of

it, notably in the case of the lyric, we find here the most famous compositions.

(*γγ*) The question consequently arises by virtue of what poetry may be enabled to still maintain its independence even in the conflict above described. The answer is simple. It must regard and assert the occasional facts it borrows from life not as its essential aim, while it is itself merely accepted as a means. Rather the reverse process is the right one, which absorbs the material of such reality within its own substance, and informs and elaborates the same conformably to the claims of an unfettered imagination. In other words poetry has nothing to do with the accidental or incidental fact as such. This material supplies the external opportunity, that is the stimulus which prompts the poet to draw upon his own profounder penetration and more transparent mode of presentment: by this means he creates from his own resources, as something newborn, that which, without such mediation, would have, in the plain and blunt particular case, wholly failed to impress us with the free spirit he communicates.

(*γ*) In conclusion then we may affirm that every genuine work of poetry is an essentially infinite organism.[16] In content rich, it unfolds this content under a mode of appearance which is adapted to it. It is permeated with a principle of unity, but not one referable to the form of utility, which subordinates the particular to itself in an abstract relation, but rather one that absorbs the same in the singularity relevant to one identical and entirely vital self-consistency, in which the whole, without any visible intention, is sphered within one rounded and essentially self-enclosed completeness. It is indeed replete with the *materia* of the visible world, but is not on that account placed, either in relation to its content or determinate existence, under a condition of dependence to any one circle of life. Rather it freely creates out of its own plenitude, striving to clothe the ideal notion of its

material in its genuine manifestation as truth, and to bring the world of external fact into reconciled accord with its own most ideal substance.

3. THE CREATIVE IMPULSE OF THE POET[17]

I have already discussed at considerable length, in the first part of this work, the talent and genius, the enthusiasm and originality of the artist. I will consequently merely touch upon one or two points in the present reference to the art of poetry which appear of importance, if we contrast this activity as effective here with that operative in the plastic arts and music.

(*a*) The architect, sculptor, painter and musician have to deal with an entirely concrete and sensuous material, in and through which each has to elaborate his creations. The limitations of this material condition the specific form that the type of the conception no less than the mode of artistic execution assume. The more fixed and predetermined the general lines of his definition are upon which the artist has to concentrate himself, the more specialized becomes the talent required for the assertion of the same in any one and no other mode of presentment; and we may add in the powers of technical execution which accompany it. The talents adapted to the poetic art, regarding the same from the point of view of an ideal envisagement in a specific *materia*, is subordinated in a less degree to such conditions; it is consequently more open to universal practice, and in this respect more independent. The need here at least is merely that of a gift for imaginative creation. Its limitation is confined merely to this, namely, that for the reason that this art is expressed in language, it has to guard itself on the one hand from deliberate rivalry with external objects in their sensuous completeness, in the form, that is, where we find the plastic artist apprehends his subject-matter in its external configuration: and, from a further point of view, it is unable to rest in the unspoken ideality, the emotional tones of which constitute the realm of music. In these respects

the problem proposed to the poet, if we contrast him with artists in other arts, is at once more *facile* and more *difficult* It is more easy, because, although the poet, in the poetical elaboration of speech, must possess a trained talent, he is spared the relatively more manifold task of triumph over technical difficulties necessary in the other arts. It is more difficult because, just in proportion as poetry is less able to complete the objective envisagement, it is compelled to seek some compensation for this loss on the side of sense in the genuine core of Art's own ideality, in the depth of imagination and a really artistic mode of conception.

(*b*) For this reason the poet is, in the *second* place, constrained to penetrate into all the wealth of the spiritual content, and to lay bare to the vision of mind what is concealed in its depths. For however much in the other arts, too, the ideal must shine forth through its corporeal manifestation, and does so in life itself shine forth, yet the medium of speech remains that most open to intelligence, and the means most adequate to its revelation. It is the one medium able to grasp and declare everything whatever that flows through or is present in consciousness, whether regarded in its ascent or profundity. In consequence of this the poet finds himself confronted with difficulties which the other arts are not called upon to overcome or satisfy to the like degree. In other words, for the very reason that poetry is actually operative in the world of idea or imagination itself, and is not concerned with fashioning for its images an objective existence independent of such ideality, it is placed in an element or sphere in which the religious, scientific and everyday consciousness are active; it must therefore take care to make no excursion into the domain or mode of conception proper to any of these, or to get mixed up with them. No doubt in the case of every art we find points of contact with other arts. Artistic creation of every kind proceeds from *one* mind or spirit, which comprehends in itself all spheres of self-conscious life. But with the other

arts the distinction of conception in each case is in its mode complete, for the reason that this, in its ideal creation, persists throughout in permanent relation to the execution of its images in a definite sensuous material, and consequently is absolutely distinct, no less from the forms of the religious consciousness, than it is from the thinking of science and the intelligence of ordinary life. Poetry, on the contrary, avails itself, in its manner of objective communication, of the very means adopted in these spheres of mental activity, that is to say, human speech; it finds itself, consequently, otherwise placed than are the plastic arts and music, which occupy a different field of conception and expression.

(*c*) *Thirdly*, we have the final demand made upon the poet for the most profound and manifold transfusion of the subject-matter of his creations with the animating soul of life, because it is his art which is capable of absorbing most profoundly the entire fulness of the spiritual content. The plastic artist, in a similar way, must apply himself to a transfusion of ideal expression in the *external form* of architectonic, plastic and the forms peculiar to painting. The musician must likewise rivet his attention on the *inner soul* concentrated in emotion and passion and their outpouring in melodic expression. In both cases the artist must be steeped in the most ideal intention and substance of his content. But the sphere of the poet's creative activity extends yet further, for the reason that he has not merely to elaborate an ideal world of soul-life and the self-conscious mind. He has, in addition, to discover for this ideal realm an external mode of envisagement fitted thereto, a mode by virtue of which that ideal totality shines through in more irresistible perfection than is possible in the case of other arts. It is incumbent upon him to know human existence, both as soul-life and objective life, to receive into his inmost being the full breadth of the world and its shows, and to have felt through it there, penetrated, enlarged, deepened and revealed to himself all it implies. Only after that, and in order

that he may find it in his power to create, as from his own spiritual experience outwards, a free whole, — ay, even in the case where he restricts his effort to a comparatively narrow and particular range, — he must have liberated himself from all embarrassment with his subject-matter, whether of a *technical*[18] character or otherwise, able in short to survey the ideal and external aspects thereof with the same free glance. From the point of view of *instinctive* creative vigour[19] we may in this respect pre-eminently praise the Mahomedan poets of the East. The starting-point in such compositions is a freedom which, even in the moment of passion, remains aloof from such passion, and in all the variety of its interests retains exclusively throughout the *one* substance as its veritable core, in contrast to which everything else appears small and transitory, and nothing of finality is left either to passion or lust. This is a philosophical outlook, a relation of spirit to the facts of the world, which comes more readily to age than youth. For in old age no doubt the interests of life are still present; but they are not there with the urgency of youthful passion, but rather in the guise of shadows, and to this extent are more readily conformable to ideal relations such as Art demands. In opposition to the ordinary view that youth with its warmth and vigour is the fairest season for poetic creation, we may rather, at least from this point of view, maintain just the opposite, that the ripest season belongs to the autumn of old age, provided that it is able to preserve its energies of outlook and emotion. It is only to a blind old man, Homer, that we ascribe those miraculous poems which have come down to us under that name. And we may also affirm of our Goethe that only in old age, after he had fully succeeded in liberating his genius from all restricting limitations of sense, that he gave us his most exalted creations.[20]

[1] That is, the essential notion (*Begriff*) of Art generally.

[2] *Substantiellen*, *i.e.,* the form that most corresponds to its essence.

[3] *Theoretisch.* Hegel doubtless has the Greek word in his mind. It is a *Bildung* for the mind rather than with a view to action. It assumes contemplation rather than volition.

[4] It is not quite clear whether Hegel means by *Bedürfniss* the need of spiritual life, or the profounder demand of reality. It might stand for either.

[5] That is, the *Vernünft.*

[6] *Das individualisirte Vernünftige*, *i.e.*, reason as realized in concrete personality.

[7] *In seiner Gediegenheit und schlagenden Fassung. Gediegenheit* here thorough grasp. *Schlagenden* may possibly mean arresting character of the conception rather than definite, precise.

[8] That is, the notion.

[9] By *aus dem Geiste* it is quite possible that there is no reference to individual genius. In that case the translation would be "in terms of human intelligence," *i.e.*, from the resources of human reason.

[10] This seems to be the meaning of *die Sache der Zeit.*

[11] Lit., "They do not come forth from self-substantive and immediately free vitality (Lebendigkeit)." *Lebendigkeit* is here the ideal and creative force or bond of soul-life as above described.

[12] The German word would imply here an interpretation of symbolic or at least ideal significance.

[13] This I presume is the general meaning of the sentence: *Asien aber, das er besiegt, ist in der vielfachen Willkühr seiner Einzelnen Völkerschaften nur ein zufälliges Ganzes.*

[14] *Ein Sollen.*

[15] It is possible that too much stress is laid on this line of difference. The fundamental difference between oratory and poetry is that of form. At least it can hardly be denied that the power of the orator to meet the demands of local conditions is a vital feature of his art, that in this respect a Demosthenes is greater than Burke. It is surely a mistake to assume that such limitations in themselves or necessarily are an obstacle to creative genius. It is rather the sign of supreme oratorical power that it can mould them and command them in conjunction with its more majestic spirit. In this lies an essential part of the art itself, just as a sculptor or a painter, such as Tintoret in the S. Rocco Scuola, dominates the defects of local condition.

[16] Infinite, that is, not in the temporal sense, but as a complete and self-realized whole.

[17] Hegel calls it "the poetising subjectivity"; that is, the personal activity essential to poetic composition.

[18] *Practischen*.

[19] This appears to be the meaning of *des Naturells*.

[20] This is perhaps less true of Goethe than it is of either Milton or Shakespeare. It is possible that Hegel thought more highly of the second part of "Faust" as art than do the majority of modern critics. But the truth is there, if subject to a good deal of qualification in respect to certain aspects of poetry. As Meredith says:

"Verily now is our season of seed,
Now in our Autumn."

And Meredith was not one to do less than justice to the superb Dream of imaginative youth.

II

THE EXPRESSION OF POETRY

The field of vision which first will occupy our attention, but the boundless expanse of which we can only traverse with a few general observations, is that which concerns the poetic generally, the content no less than the mode of conception and organic association adapted to the poetic work of art. This background will help to emphasize the *second* aspect of our subject, which is *poetic expression* more strictly, the idea in the ideal objectivity of the word appropriated by it as symbol of the image, and the melodious vehicle of its speech.

We may infer the nature of the relation between poetic expression generally and the mode of presentment proper to the other arts from our previous examination of the characteristics of the poetic art. Language and the sounds of words are neither a symbol of spiritual conceptions, nor an adequate mode of projecting ideality under the condition of spatial objectivity in the sense applicable to the corporeal forms of sculpture and painting, nor yet an intonation in musical sound of the entire soul. They are an abstract *sign* simply. As the vehicle of the poetic image or conception, however, it is necessary that this side also, in theory no less than deliberate elaboration, appear as distinct from the kind of expression appropriate to prose.

We may for this purpose emphasize with more detail three main points of distinction.

Our *first* point is this, that although poetic expression is throughout exclusively embodied in articulate words, and apparently as such is simply related to human speech, yet in so far as the words themselves are merely abstract signs representative of *ideas,* the true source of poetic speech is not to be discovered in the selection of particular words, and in the manner they are associated in sentences and elaborated phrases, nor in harmonious rhythm, rhyme and so forth, but in the type of *conception* employed. We have, in short, to look for our point of departure for the constructive use of expression in the choice of the idea or image, find our first and foremost question will be what kind of conception will give us an expression suitable to poetry. *Secondly*, however, it remains the fact that the imaginative idea essentially pertinent to poetry is exclusively made objective in *language.* We have consequently to investigate the expression of speech according to its purely verbal aspect, in the light of which poetic words are distinguishable from those of prose, poetic phrases from those of our

ordinary life and prosaic thought, abstracting in the first instance the mere sound of them to our sense of hearing.

Finally, we have to recognize the fact that poetry is a mode of articulate speech, the sounding word, which in its temporal duration no less than its actual sound, must receive a definite configuration, one that implies the presence of time-measure, rhythm, melodious sound and rhyme.

I. THE POETIC CONCEPT OR IDEA

What in the plastic arts the sensuous visible *form* expressed by means of stone and colour is, or what in the realm of music animating strains of harmony and melody are, this — we must repeatedly insist on the fact — can only be, in respect to poetic expression — the idea or image itself. The force of the poet’s creation centres consequently, in the fact that the art moulds a content in an ideal medium, and without bringing before us the actual forms of external Nature and the progressions of musical sound; by doing so, therefore, it translates the objective presence accepted by the other arts into an ideal form, which Spirit or intelligence expresses for the imagination under the mode which is and must remain that of our conscious life.

A distinction of this very character was already insisted on when we had occasion previously to establish a distinction between the earliest type, of poetry and its later modes of reconstruction from the data of prose.

(*a*) Imaginative poetry in its *origin* is not as yet a consciously distinct form from those extremes of ordinary conscious life, one of which brings everything to vision under the mode of immediate and therewith contingent singularity, without grasping the ideal essence implied therein, and the manifestation of the same; while the other, in one direction, differentiates concrete existence into its various characteristics, making use of abstract generalization, and in another avails itself of the scientific faculty as the

correlating and connecting focus of such abstractions. The idea is only poetical in so far as it holds these extremes in unviolable mediation, and thereby is able to maintain a position of genuine stability midway between the vision of ordinary consciousness and that of abstract thought.

In general terms we may define the poetic imagination as *plastic*[1] in so far as it brings before our vision concrete reality rather than the abstract generalization, and in the place of contingent existence an appearance of such a kind that we recognize what is substantive immediately in it by virtue of its embodiment itself and its individuality, and as inseparable from it, and by virtue of this are able to grasp the concrete conception-of the fact in question no less than its determinate existence as one and the same vital whole reposing in the ideal medium of the imagination. In this respect we find a fundamental distinction between that whereof the plastic or constructive idea is the source and all that is otherwise made vivid to us through other means of expression. The same truth will appear to us, if we analyse what we mean, by mere reading. We understand what the letters mean, which are indicative points for articulate utterance, by the mere act of sight, and without being further obliged to listen to their sound. Only the illiterate reader will find it necessary to speak aloud the separate words that he may understand their sense. But in the case of poetry just what seems to be here the mark of stupidity is an indication of beauty and excellence. Poetry is not satisfied with an abstract effort of apprehension, nor does it bring objects before us as we find them in the form of reflection and in the unimaginative generalization of our memory. It helps us to approach the essential notion in its positive existence, the generic as clothed in its specific individuality. In the view of ordinary common sense I understand by language, both in its impression on my hearing or sight, the meaning in its immediacy, in other words, without receiving its image before the mind. The phrases, for instance, “the sun,” or “in the morning,” possess each of

them no doubt a distinct sense; but neither the Dawn or the Sun are themselves made present to our vision. When, however, the poet says: “When now the dawning Eos soared heavenwards with rosy fingers,” here without question we have the concrete fact brought home to us. The poetical expression adds, however, yet more, for it associates with the object recognized a vision of the same, or we should rather say the purely abstract relation of knowledge vanishes, and the real definition takes its place. In the same way take the phrase, “Alexander conquered the Persian empire.” Here, no doubt, so far as content is concerned, we have a concrete conception; the many-sided definition of it, however, expressed here in the word “victory,” is concentrated in a featureless and pure abstraction, which fails to image before us anything of the appearance and reality of the exploit accomplished by Alexander. This truth applies to every kind of similar expression. We recognize the bare fact; but it remains pale and dun, and from the point of view of individual existence undetermined and abstract. The poetic conception consequently embraces the fulness of the objective phenomenon as it essentially exists, and is able to elaborate the same united with the essential ideality of the fact in a creative totality.

What follows as a primary result of this is that it is of interest to the imagination to *linger* near the external characteristics of the fact, to the extent at least that it seeks to express the same in its positive reality, deems this as essentially worthy of contemplation and insists on this very attitude.

Poetry is consequently in its manner of expression *descriptive* Description is, however, not the right word for it. We are, in fact, accustomed to accept as descriptive, and in contrast to the abstract definition, in which a content is otherwise brought home to our intelligence, much that the poet passes by, so that from the point of view of ordinary speech poetic composition can only appear as a roundabout way and a

useless superfluity. The poet must, however, manage to bring his imagination to bear upon the explication of the actual phenomenon he is attempting to depict with a vital interest.[2] In this way, for instance, Homer adds a descriptive epithet to every hero. So Achilles is the swift-footed, the Achaeans bright-greaved, Hector as of the glancing helm, Agamemnon the lord of peoples, and so forth. The name is no doubt descriptive of a personality, but the name alone brings nothing further to our vision. To have some distinct idea of this we require further attributes. We have in fact similar epithets attached by Homer to other objects, which are essential to our vision of the epic, such as sea, ships, sword and others, epithets which seize and place before us an essential quality of the particular object, depicting it more precisely, and which enable us to apprehend the fact in its concrete appearance.

Secondly, we must distinguish such reconstruction of actual facts from definition *wholly imagined*. This offers a further point of view for discussion. The real image merely places before us the fact in the reality it possesses. The expression of the poet's imagination, on the contrary, does not restrict itself to the object in its immediate appearance; it proceeds to depict something over and above this, by means of which the significance of the former picture is made clear to our mind. Metaphors, illustrations, similes become in this way an essential feature of poetic creation. We have thereby a kind of veil attached to the content, which concerns us, and which, by its difference from it, serves in part as an embellishment, and in part as a further unfolding of it, though it necessarily fails to be complete, for the reason that it only applies to a specific aspect of this content. The passage in which Homer compares Ajax, on his refusing to fly, to an obstinate ass is an illustration. To a pre-eminent degree oriental poetry possesses this splendour and wealth in pictorial comparisons. There are two main reasons of this. First, its symbolic point of view makes such a search

for aspects of affinity inevitable, and in the universality of its centres of significance it offers a large field of concrete phenomena capable of comparison; secondly, on account of the sublimity of its predominant outlook there is a tendency to apply the entire variety of all that is most brilliant and glorious in its motley show to the embellishment of the One Supreme, which is held before the mind as the sole One to be exalted. This object of the imagination, moreover, is not to be apprehended as merely the work of fanciful caprice or comparison, possessing as such nothing in it essentially actual and present. On the contrary the transmutation of all particular existence into further existence in this central idea grasped and clothed by the imagination is rather to be understood as equivalent to the assertion that there is nothing else essentially present, nothing that otherwise can put forward a claim to substantive reality. The belief in the world as we apprehend it with the vision of ordinary common sense is converted into a belief in the imagination, for which the only world that verily exists is that which the poetic consciousness has created. Conversely we have the romantic imagination, which is ready enough to express itself in metaphor, because in its vision what is external is for the essentially secluded life of the soul only accepted as something incidental, something that is unable adequately to express its own reality. To reclothe this consequently unreal externality with profound emotion, with all the fulness of detail envisioned, or with the play of humour upon the conjunction of such opposites is an impulse, which constrains and charms romantic poetry to ever novel discoveries. The object of importance here is not so much to make the fact clear and distinct to the vision; on the contrary the metaphorical employment of these outlying phenomena is itself the aim proposed. The emotion of the poet concentrates itself as the centre, which the environment enriches with its wealth; it absorbs this as part of itself, adapts it with genius and wit to its adornment, steeps it in its own life, and

finds in this movement to and fro, this elaboration and self-reflection of its creation its own source of delight.

(*b*) *Secondly*, we have the contrast present between the poetic mode of conception and that of *prose.* The thing of importance in the latter case is not that which is imaged, but the significance as such which constitutes the content. It is on account of the latter that the idea or image becomes a mere means to bring the content before the mind. The composition of prose is therefore neither compelled to place the more detailed reality of its objects before our vision, nor to summon before us, as is the case with the metaphorical mode of expression previously described, another idea which carries us beyond the immediate object to be expressed. No doubt it is also necessary in prose to indicate in firm and distinct outlines the positive appearance of objects; but this is so not on account of their figurative character,[3] but to meet a specific and practical purpose. Generally speaking we may therefore affirm *accuracy* to be from one point of view the ruling principle of prose composition, and from another a *clear definition* and intelligibility of statement. In contrast to this the language of metaphor and imagery is in general and relatively less clear and more inaccurate. For in that mode of direct expression, such as we have presented by our first form of the poetic conception, the fact in its simplicity is carried away from our immediate apprehension of it as a mere object into the actual world of concrete fact, and we have to recognize it as a part of this, while in that second and more oblique form some phenomenon of affinity merely and one even aloof from the essential significance of our subject is made present to us. We do not, therefore, wonder that prosaic commentators of our poets have no easy task when they seek to separate, by means of their scientific analyses, the image from the significance, to extract their abstract content from the vital form, and thereby expound poetic modes of composition to the prosaic mind.

In poetry this accuracy, this rigour in unfolding the content as we find it in its simplicity, is not alone the essential principle. On the contrary, though prose is forced to confine its ideas on parallel lines of almost mathematical precision with the nature of its content, poetry introduces us to a different sphere altogether, that is, the *visible appearance* of the content itself, or other natural phenomena related to it. For it is just this objective reality which in poetry ought to appear, and while unquestionably from one point of view revealing that content, yet at the same time from another it has to liberate itself from the purely abstract content, it being essentially an object of the art to direct attention to its actual existence in the visible world, and to arouse the interest of mind in the forms of life itself.

(*c*) If these three essential requirements of poetry are conditioned by an age, in which the accuracy of the prosaic mind is become the ordinary type of conscious life, the art, so far as its figurative characteristics are concerned, is placed in a more difficult position. That is to say, in such an epoch the type of penetration exercised by conscious life is generally a separation of emotion and the ordinary outlook from scientific thought, which either converts the ideal and external material of feeling and perception into a stimulus of knowledge and volition simply, or into a plastic medium subservient to observation and action. In such a sphere poetry calls for energies of more definite purpose in order that it may free itself from the abstraction of the prevailing mental attitude and enter into the world of concrete life. Where, however, such a goal is realized, not only do we find that this breach between thinking, which makes for generalization, and perception and feeling, which grasp the particular, vanishes, but these last-mentioned modes of conscious life are, together with their subject-matter and content, at the same time freed from their exclusive relation of service; and the process culminates in a victorious reconciliation of such modes with what is essential universality. Inasmuch,

however, as both the modes of poetic and prosaic thought and general outlook are united in one and the same conscious life, we find in it indications of trouble and derangement, even possibly an actual conflict between the two, one which, as the poetry of our times testifies, only genius of the highest order is able successfully to deal with. Added to this there are other collateral hindrances, which I only propose to define now, and that briefly, in their relation to the figurative aspect already discussed. In other words, if the prosaic intelligence takes the place of that creative imagination which previously obtained, then and in that case the rejuvenescence of the poetic faculty, both in all that is associated with the positive expression of facts and what is metaphorical, readily offers the semblance of artificiality, which even where it falls short of actual purpose, is only with great difficulty reconciled with that directness of immediate truth which is demanded. Much in fact which was still fresh in former times, through repeated usage, and the habits thus originated, has itself become gradually a custom and a part of prosaic life. Moreover, where poetry strives after novelties in its composition, we often find that, despite of itself, in its figurative expressions and descriptions, even where it escapes the charge of exaggeration and an excess of such material, it none the less leaves an impression of artificiality, over nicety, a straining after what is piquant and select, work incompatible with a simple and healthy outlook and state of feeling. Such work tends to regard objects in an artificial light and reckons on mere effect. Consequently it will not permit their natural lighting and colour. Defects of this nature are still more obvious in cases where, as a rule, the metaphorical type of imaginative composition is exchanged[4] for the more direct, and our poet is driven to outbid the forces of prose; and, in order to assert an originality, plunges into the subtleties of or the fishing for effects which have still some appearance of freshness.

2. VERBAL EXPRESSION

Inasmuch as the poetic imagination is distinct in its operation from that of all other artists in virtue of the fact that it necessarily clothes its images in words, and communicates the same through human *speech*, it becomes imperative that throughout this process it should endeavour to co-ordinate all its ideas, in the form which with most completeness will disclose them, through the means articulate speech thus places at its disposal. And, in short, we may affirm that the poetic content only assumes the form of poetry in its restricted sense after it has been actually embodied and rounded off in the vehicle of words.

This literary aspect of the art of poetry would readily supply us with a boundless field of discursive observation and logical argument, which I must, however, pass over in order that I may reserve space for more weighty problems which lie before us. I merely propose, therefore, to touch very briefly on a few fundamental points.

(*a*) Human art should in all its associations place us on a ground quite other than that we confront in ordinary life, or indeed in our religious consciousness, active life, or the speculations of philosophy. This is possible on the side of literary or verbal expression only in so far as another mode of speech is adopted than that obtaining in those other spheres. Art has therefore not only, from one point of view, to avoid that in its instrument of expression which will fail to rise above the trivialities of ordinary speech and ordinary prose, but it must, furthermore, avoid falling into the tone and manner of religious edification and philosophical research. Above all it must keep aloof from the precise analyses and *methods* of the scientific faculty, the categories of pure thinking as we find these illustrated in the logical forms of judgment and deduction. These at once remove art from the imaginative realm to another region altogether. But in all these respects it still remains a difficult matter to determine the lines of boundary on which we may actually affirm that poetry ends and prose begins. And in

fact we may admit absolute precision and confidence of statement to be impossible from the nature of the case.

(*b*) If we pass now to a discussion of the particular *means* which poetic-speech can appropriate as instrumental to its task the following points appear to me pregnant and suggestive.

(*α*) *First*, we find particular *words* and exclamations[5] that are obviously peculiar to poetry, whether they be used to ennoble it, or to introduce the vulgarity and excess of comedy. We find a similar novelty in the specific collocation of various words or turns of expression. In such a field poetry is no doubt entitled on the one hand to borrow from an obsolete nomenclature, obsolete at least in everyday speech, and on the other to declare itself as pre-eminently an innovator, moulding novel modes of speech. Such a field, provided only the vital genius of the language is preserved, supplies material for astonishing boldness of invention.

(*β*) *Secondly*, we have the problem of verbal order. It is here that we meet with those so-called figures of speech, in so far as, we should add, the same have reference to verbal embodiment as such. The use of these, however, easily degenerates into rhetoric and declamation in the bad sense of these terms; the vitality of individual character is destroyed where we find that such forms substitute a fixed and artificial mode of expression for the genuine impulse of feeling or passion, and thereby offer the very opposite to the personal, laconic and broken utterance required, the utterance whose emotional depth is incapable of saying much, and for this reason, in romantic poetry especially, is of great effect as a presentment of suppressed[6] states of soul. But generally speaking we may admit that the relative order of words is an instrument of the external form of poetry of quite extraordinary resource.

(*γ*) *Thirdly*, we have still to draw attention to the construction of *periods,*[7] which essentially embrace all the other aspects of composition and which, by means of either their simple or more involved course, their restless dislocations and distortions, or their quick onward motion, their acceleration and their flood contribute so materially to the reflection of such soul experience. And, in short, it is essential that the external presentment in speech should mirror and assume a character similar to the ideality of such experience in all its variety.

(*c*) In the *application* of the means of speech above considered it will be useful to distinguish once more the several stages of poetic thought to which they correspond and to which we drew attention when we considered the nature of poetic conception or composition.

(*α*) Poetic diction can, in the first instance, appear with real vitality among a people and at an epoch when the general speech is not as yet perfected, but in fact only by virtue of its poetry receives its real development. At such a time the utterance of the poet, as generally expressive of soul-life, is from the first a real novelty, which stirs admiration on its own account by revealing in its speech what remained previously unveiled. This new creation appears as the marvel of a gift and personal power. The weight of custom has not as yet fallen upon it. It enables that which is buried in the depths of the human heart for the first time to freely unfold itself before the amazement of men. Under such conditions it is the native force of the expression, the creation of the fact of speech, not so much the varied and craftful elaboration of the same, which is the main point. Diction here remains exceedingly simple. In such early times it is indeed impossible that we should have either much fluency of idea or any varied versatility of expression. The subject-matter of such poetry is depicted with an artless directness, which has not yet attained the

delicate nuances, transitions, mediatory matter and other advantages of a later artistic culture. In such an age the poet is in fact the first person to give an utterance to the national voice, to express ideas in speech, and thereby to encourage the imagination itself. Speech is, if we may so express it, not yet inseparable from ordinary life, and poetry can still freely, with an effect of freshness, avail itself of all that in later times, as the speech of common life, gradually is severed from art. In this respect, for example, Homer's type of expression is to the modern man barely distinguishable from ordinary speech. For every idea we have the direct word[8]; metaphorical expressions are comparatively rare; and although the poem is composed with a close attention to detail, the speech itself remains very simple indeed. In a similar way Dante was able to create for his own nation a vital form of poetic expression, and asserted in this, as in other respects, the dauntless energy of his creative genius.

(β) When, however — this is a *further* point — the circle of ideas enlarges with the appearance of methodical modes of thought the ways in which idea is associated with idea increase, and in this very process the ability to use it increases also, and the expression of speech is elaborated in all the fluency of which it is capable. When this is so the position of poetry on the side of verbal expression is wholly changed. In other words, we have now a nation possessing the fully developed prose speech of everyday life, and poetic expression must now, in order to retain its interest, swerve aside from ordinary parlance, and receive a resurrection under the re-moulding energy of genius.[9] In our daily life the contingency of the moment is the motive of speech. In the creation of a work of art, however, we must have deliberate circumspection[10] in the place of instantaneous feeling; even the spirit of enthusiasm must be judiciously restrained. The creation of genius should be permitted to unfold itself from the artistic repose,[11] and become informed under the prevailing temper of an intelligence[12] that surveys the

whole with clarity. In former times this spirit of concentration and tranquillity is to be inferred from the fact and utterance of poetry itself. In a more recent age, on the contrary, the nature of the composition and execution has itself to enforce the distinction which obtains between the expression of poetry and prose. In this respect poems which belong to epochs in which we find already an elaborated prose diction differ essentially from those of times and peoples in which the art originates.

The executive talent of a poet can be carried so far in this direction that the elaboration of formal expression becomes the main thing, and the aim is less directed to ideal truth than to formal construction, a polished elegance and mere effect of the composition under its literary aspect. We have then a situation, in which, as already observed, rhetoric and declamation are elaborated in a manner destructive to the ideal vitality of the poetic spirit. The formative intelligence asserts itself under the principle of *purposiveness*, and a selfconsciously regulated art disturbs that more genuine effect, which ought to present the appearance of ingenuous openness and simplicity. Entire nations have, with the rarest exceptions, failed to produce any type of poetic creation other than this rhetorical one. The Latin language, even in Cicero, still preserves a genuine ring of naïveté and naturalness. With the Latin poets, however, such as Virgil, Horace and the rest, we already feel that Art is to a real extent nothing but artifice, elaboration of effect on its own account. We recognize a prosaic content, which is merely set off with an external embellishment. We find a poet who, in the absence of original genius, endeavours to discover, in the sphere of literary versatility and rhetoric effects, some compensation for that which in genuine power and effect of creation and composition he fails to possess. France too, in the so-called classical period of its literature, has produced poetry very similar, a poetical style to which didactic poems and satires are singularly appropriate. Rhetorical figures of speech in all their variety are

here in their rightful place. The exposition remains for all that, as a whole, prosaic; and the literary expression is at its best rich in image and embellishment, much in the style of Herder's or Schiller's diction. These last-mentioned writers, however, availed themselves of this style of literary expression mainly in the interests of prose composition; and by the weightiness of their reflections and the happy use of such a style knew how to win both a critical assent and a hearty approval. The Spanish poets also are not wholly free from the ostentation inseparable from the too self-conscious diction of art. And, as a general rule, Southern nations, such as the Spaniards and the Italians, and previously to them the Mohammedan Arabs and Persians, are conspicuous for a wealth and tedious prolixity of image and simile. With the ancients, more especially in the case of Homer, the flow of expression is characterized by smoothness and tranquillity. With the nations above mentioned, on the contrary, we have a vision of life gushing forth[13] in a flood which, even where the emotions are in other respects at rest, is ever intent upon expatiation, and owing to this expressly volitional effort of the will is dominated by an intelligence which at one time is visible in abrupt parentheses, at another in subtle generalization, at another in the playful conjunction of its sallies of wit and humour.

(*γ*) Genuine poetic expression in short is as far removed from all rhetorical declamation as above described as it is from all ostentation and witty conceits of diction, in so far at least as such defects do injury to the ideal truth of Nature, and the claims of the content are forgotten in the verbal form and expression of the composition. It is, however, possible, despite of this, that the author's free enjoyment in his work declare itself with real beauty. In a word that aspect of the composition we define as formal diction ought not to be treated on its own and independent account alone, or as an aspect of first and even exclusive importance. And, generally speaking, in this analysis of the composition of poetry under its formative

aspect, we repeat that what is the product of careful thought must not lose the appearance of genuine spontaneity: everything should impress us as though it had of itself blossomed from the ideal germ or heart of the subject-matter.

3. VERSIFICATION

Our *third* and final aspect of poetic expression is necessitated by the fact that the imagination of the poet does not merely invest ideas in words, but does so in the form of the uttered speech; and by doing so he consequently enters the domain wherein our senses are made aware of the actual sounds and music of speech. We are thus introduced to versification. Versified prose may give us verses, but that is not necessarily poetry. We have a parallel case in the merely poetic expression of a composition in other respects prosaic with its result of poetic prose simply. Yet for all that metre or rhyme is an essential demand of poetry, bringing, as it were, a perfume of its own to the senses; nay, it is even more essential than a richly imaginative and so-called beautiful diction.

And in truth the artistic elaboration of this sensuous medium[14] unfolds to us — it is the very demand of the art itself — another realm, another field, which we only really enter after having left behind us the prose of ordinary life, whether viewed as action or as literary composition. The poet is thereby compelled to move in a literary atmosphere outside the boundary of everyday speech, and to shape his compositions with an exclusive regard to the rules and requirements of Art. It is therefore only a superficial theory which would banish all versification on the ground that it contradicts natural expression. It is true that Lessing, in his hostility to the false pathos of the French Alexandrine metre, attempted, more particularly in tragedy, to introduce a form of prose speech as most appropriate. Both Schiller and Goethe have, in the more stormy works of their youth, and under the natural

impulse of compositions carrying a greater surfeit of content, adopted the same principle. But Lessing himself, in his Nathan, finally returns once more to the iambic. And in the same way with his Don Carlos Schiller deserted the old path. Goethe too was so little satisfied with the earlier prosaic treatment of his Iphigeneia and Tasso, that he transferred them to art's more proper domain, remoulding them both from the point of view of expression and prosody in that purer form, wherein these compositions continue and will continue to excite our admiration.

No doubt the artificiality of the verse measure or the recurrent echoes of rhyme has the appearance of an unyielding[15] bond between spiritual ideas and the sensuous medium, more rigorous indeed than colour in painting. External objects and the human form are coloured in Nature, and the colourless is an arbitrary abstraction. The idea, on the contrary, in association with the sounds of human speech, which are employed in the wholly capricious symbols of their utterance, possess only a distant or no ideal thread of connection at all. This being so, the exacting demand of the prosodical rules will very readily appear as a fetter to the imagination, in virtue of which it is no longer possible for the poet to communicate his ideas in the precise form in which they float upon his phantasy. The inference is natural that although the stream of rhythm and the music of rhyme exercises upon us as an unquestionable fascination, it is nevertheless not unfrequently and too much so the demand of this very charm to our senses that the finest poetic feeling and idea should be sacrificed. But the objection for all that will not hold water. In other words it is not true that versification is simply an obstruction to spontaneous movement. A genuine artistic talent throughout moves in its sensuous material as in its native element, which so far from being oppressive or a hindrance acts as a stimulus and a support. And in fact we find that all really great poets move with freedom and confidence in the measure, rhythm or rhyme they have

created; and it is only when they are translated that our artistic sense is frequently pained or shocked at the attempt to retrace their rhythm and melody. Moreover it is part of the liberality of the art that the very circumstances of the restraint, involving much change, concentration or expansion of the ideas expressed, should suggest to our poet new thoughts, incidents and creations, which, apart from such difficulties, had never crossed his mind. But in truth quite apart from this relative advantage this sensuous and determinate form of being — in the case of poetry the melodious chain of words — is once for all essential to art. It is absolutely necessary that the result should not remain in the formless and undefined stream that we have in the immediate contingency of ordinary conversation. It must appear in the vital design and elaboration of art. And although this form no doubt in the music of poetry may sound too as a purely external instrument, it has nevertheless to be treated as an end on its own account, and as such as an essentially harmonious self-defined whole. This attention, which is due to the medium of sense, contributes, as in Art universally, and in the interest of seriousness,[16] yet another point of view where we find this very austerity vanishes; both poet and listener feel it no more. They are lifted into a region of exhilarating charm and grace.

In painting and sculpture the artist is given the form in its material and spatial limitations for the portrayal and colouring of human limbs, rocks, trees, clouds and flowers. In architecture also the requirements and objects of the buildings proposed dictate more or less the defined shape given to walls, towers and roofs. In the same-way music already possesses stable definition in the fundamental laws of harmony. In the art of poetry, however, the sound of language to our aural sense is, in the first instance, unbridled;[17] the poet has consequently to regulate such absence of rule within objective limits, and to outline a more stable conture, a more definite

framework of sound for his conceptions, their structure and their objective beauty.

Just as in musical declamation the rhythm and melody should accept and adapt itself to the nature of the content, versification is also a kind of music, which, at its own distance, is capable of essentially re-echoing the mysterious, but none the less definite, course and character of the ideas. Agreeably with this the verse-measure ought to reflect the general tone and, as it were, the spiritual perfume of an entire poem, and it is by no means a question of no consequence whether the external form is one of iambics, trochaics, stanzas, alcaics or any other metre.

In the heads of discussion we propose to follow of most importance are *two* systems, whose distinction from each other we shall endeavour to explain. The *first* is *rhythmical* versification, which depends upon the actual length or shortness of the verbal syllables, whether we regard such in the association of varied figures of speech, or under the relation of their time-movement.

The *second* is that which is responsible for *tonal quality* as such, not merely in the case of isolated letters, consonants or vowels, but also in that of entire syllables and words, the configuration of which is in part regulated by the laws of the uniform repetition of identical or similar sounds, and in part by those of symmetrical change. It is to this system that we refer the alliteration, assonance and rhyme.

Both systems stand in intimate connection with the prosody of speech. This is so whether such systems are rather based throughout on the actual length or shortness of syllables, or on the accent which the mind requires,[18] as attached to the obvious importance of such syllables.

And, *finally*, we have also to *unite* together this general rhythmical movement with the music of the independent formal structure as rhyme.[19] And in this effort, inasmuch as the repeated echo of the rhyme strikes the

ear with a marked emphasis, which asserts itself predominantly over the purely temporal condition of duration and advance, the rhythmical aspect will, in such a conjunction, tend to fall back, and arrest our attention with less force.

(*a*) *Rhythmical Versification.*

In discussing the rhythmical system which is without rhyme the following points are of the most importance:

First, we have the firm and fast time-measure of syllables in their plain distinction of *long* and *shorty* as well as their manifold association with definite conditions and metres of poetry.

Secondly, we have the animation of rhythm in accent, caesura and opposition between the verse accent and that of separate words.

Thirdly, there is the aspect of *euphonious sounds* which, within this movement, is forthcoming from the sound of the words, without any further concentration in rhyme.

(*a*) For that rhythmical movement which the *time duration* and the movement itself makes of first importance rather than the melodic sound as such and singled in its isolated effect, (*αα*) we find our starting point in the *natural* length and shortness of syllables to the obvious distinctions of which the sound of the actual words, the expression of their letters, in consonants and vowels, contribute the essential basis.

Pre-eminently long by nature are the diphthongs ai, oi, ae, and the rest, for the reason that essentially — whatever our modern schoolmaster may say to the contrary — they are themselves a twofold, concrete tone, which combines, much as green does among the colours. The long-sounding vowels are equally so. As a third principle, which obtains already in Sanscrit, no less than the Greek and Latin languages, we have associated with them peculiar conditions of position. In other words, if two or more consonants are placed between two vowels the relation constitutes what is

unquestionably a difficult transition in speech. The organ of articulate utterance requires a longer period to pass over the consonants; this necessitates a pause which, despite of the presence of the short vowel, makes the syllable sound in its rhythm long, though it is not actually lengthened. If I speak the words for example — *mentem nec secus* — the movement from the one vowel to the other in *mentem* and *nec* is neither as simple or easy as in *secus*. More modern languages do not retain this last distinction with such stringency, but rather give effect, in the matter of long and short accent, to other criteria. But for all that syllables which are treated as short, despite of the position referred to, at least will not unfrequently create a harsh impression, because they obstruct the quicker movement our ear demands.

In contradistinction to the long quantity we have in diphthongs, long vowels and length created by position, we have the vowels which are by nature *short*, that is, those which are short, or which are not placed in words, where one of them and another immediately following are separated by two or more consonants.

(*ββ*) For the reason, then, that words, partly on their own account, as of several syllables, include a number of long and short beats, and in part, although of one syllable, are nevertheless associated with other words, we have thereby to start with a definite, but accidental interchange of various syllables and words without any stable measure. To regulate this accidental relation is just the function of poetry, precisely as it was that of music to define with accuracy the unregulated duration of particular tones by means of the unity of time-measure. Poetry therefore establishes specific combinations of long and short syllables as the law, by virtue of which, under the aspect of *time-duration,* it has to arrange the series of syllables. What we therefore get in the first instance are the different successions of time. The simplest is the mutual relation of pure equality, as, for example,

we find it in the dactyl and anapaest, in which the two short syllables may coalesce according to definite rule in two long syllables (the spondee). Secondly, a long syllable may be placed next one short; in that case we have a profounder distinction of derivation, though under its simplest form. Such are the iambus and the trochee. We find a more complicated combination, when a short syllable is interposed between two long ones, or one short precedes two long, as in the cretic and bacchius.

(*γγ*) Such *isolated* time-relations would, however, open the door to unregulated contingency if they were permitted to follow one another anyhow in their motley differences. In fact the entire aim of such regulation would vanish under such conditions, in other words the regulated series of long and short syllables. From another point of view we should wholly fail to secure a definite beginning, conclusion, and central position, so that the caprice which here once again asserted itself would entirely contradict that which we previously established, when considering musical time-measure and beat, as to the relation in which the percipient ego stood to the duration of tones. In other words, the ego requires a combination on its own account,[20] a return out of the continuous forward movement in time; and only seizes on the same in virtue of definite unities of time and their, as such, emphasized commencement,[21] regulated in their entire series and terminations. This is the reason why, in the *third* place, poetry also sets out the particular time-relations in a series of *verse-lines,*[22] which in respect to the type and number of their feet, no less than in that of their commencement, progress, and conclusion, are subject to rule. The iambic trimeter, for instance, consists of six iambic feet, of which any two constitute an iambic dipody. The hexameter consists of six dactyls, which again, in certain positions, may coalesce in spondees.

Moreover, as it is no objection to such lines of verse-writing that they are repeated over and over again in the same or practically under the same

mode, we find in respect to the entire series, on the one hand, a lack of definition so far as the one final conclusion is concerned, and on the other a monotony, which creates perceptibly a sense of deficiency in the ideal aspect of their manifold composition. In order to mitigate such defects poetry makes a final advance in its creation of the strophe and its varied organization, more particularly with a view to lyric expression. As an illustration we have the elegiac measure of the Greeks; there is also the alcaic and sapphic strophe, not to mention the modes of lyric art elaborated by Pindar and the famous Greek dramatists in their choric effusions or interludes.

However much, in their relation to time-measure, music and poetry partake of similar conditions, we ought not, therefore, to fail to draw attention to their dissimilarity. The most important feature of this is that of the *beat.* The question whether there is any real repetition measurable in time-beats of identical length in the metre of the ancients has been the subject of strenuous controversy. Generally speaking I think it may be affirmed that poetry, which uses language in its words as a mere means of communication, is unable, in respect to the time-length of its utterances, to subordinate the same to an absolutely fixed measure of its movement in the abstract form that is present in the time-beat of music. In music tone is simply sound, without pause as such, and it essentially requires a stability such as we find in the time-beat. Human speech does not require such security, for one reason because it already possesses something fixed and substantive in the idea, and for another because it is not thus wholly committed to the objective medium of sound or resonance; rather this very ideality of conscious life is the medium in which it consists as art. For this reason poetry in fact discovers the more substantive means of defining its arrest, continuance, pause or delay immediately in the ideas and emotions which it clearly enunciates in language. Music, too, in its recitatives, marks

the beginning of a similar process of separation from the immutable equality of the time-beat. It follows from this that, if poetical metre were wholly subjugate to the regularity of the time-beat, the distinction between music and poetry, in this sphere at least, would vanish altogether, and the element of time would receive a more predominant significance than is compatible with the essential characteristics of poetry. Supported by such a conclusion we may therefore insist that, though a *time-measure* is of imperative value in poetry, there is no such necessity for the abstract *time-beat;* meaning and signification[23] of the actual words must here remain the relatively speaking more controlling force. If we examine in this respect more closely the particular verse-measures of the ancients the hexameter will no doubt appear most nearly attached to a forward movement compatible with the stringency of the time-beat. The elder Voss in fact assumed this, though, as a matter of fact, such an assumption is already excluded by the catalexis of the last foot. When in addition to this Voss proceeded to place the time-measure of the alcaic and sapphic strophes on a similar basis of abstract equality, we can only regard such a theory as a wilful caprice which does violence to the poetry. The contention throughout is apparently due to the habit of treating our German iambic in identical lengths of syllable measure and time-measure. As a matter of fact the beauty of the iambic trimeter of the ancients consisted above all in this, that it was not composed of six iambic feet of identical lengths of time; but quite the contrary in order that, in the first position of every dipody, spondees, or, in their resolution, also dactyls and anapaests were permissible; and, by reason of this, the monotonous repetition of the same time-measure, and thereby all that is consistent with the time-beat, vanishes. We may add that the possibility of change is yet more obvious in lyric strophes, so that if we wish to establish such a thesis at all it must be on the *à priori* principle, that

the time-beat is essentially necessary. As a deduction from the plain facts we see nothing of the kind.

(*β*). With the introduction of the *accent* and the *caesura* we have for the first time the animation of the time-measure; we may parallel with this that rhythm in music, which we have discussed as the time-beat.

(*αα*) In short in poetry also every definite time relation has, in the first instance, its particular accent; in other words, regularly defined intervals are asserted, which attract others and only in this way are rounded off in a whole. Owing to this fact much play is given to the *manifold possibilities* of the value of syllables. On the one hand generally long syllables appear emphasized in their contrast to short, so that now, if the ictus falls upon them, their significance is doubled as against the shorter, and in fact stand out themselves as distinct from long syllables not thus accented. On the other hand, however, it may also happen that shorter syllables receive the ictus or accent, so that a similar emphasis is created to the one described in the converse case.

Above all, as already observed, the beginning and termination of the particular feet ought not with abstract precision to be identical with the beginning and conclusion of single words. For, in the *first* place, the reach forward[24] of the essentially exclusive word over the termination of the foot of the line affects the connection of the otherwise disparate rhythms. *Secondly*, when the verse accent falls on the final sound of a word carried forward as above described, we get on account of this in addition a distinct interval of time, the conclusion of a word having already come to a pause in something else, so that it is in fact this pause, which, in virtue of the accent united with it, is expressly made perceptible as a segment of time in the otherwise unbroken current. Caesuras of this sort are inevitable with every kind of verse. For although the distinct accent already confers on particular feet a more intimate and essential distinction, and thereby a certain variety,

this sort of animation, especially in the case of verses, in which the same feet repeat each other without a break, as, for example, in our iambic, remain for all that in a measure entirely abstract and monotonous, and furthermore allow the particular feet to fall apart without a common bond. It is this gray monotony which the caesura checks, introducing a connection and more genuine animation within what was otherwise, with its undifferentiated regularity, the halting flow of verse, a life which, by virtue of the various positions in which the caesura may assert itself, is itself as manifold as is possible agreeably with the condition that its regulated definition is held free from any approach to lawless caprice.

A *third* accent is furthermore attached to the verse accent and caesura, which the words in other respects and independently possess, apart from their metrical employment. By this means the mode and degree in which the particular syllables are emphasized or the reverse increases in its variety. This verbal accent may, on the one hand, no doubt appear in conjunction with the accent of the verse and the caesura; and, if this is the case, the strength of the accents respectively is increased. But from another point of view it may stand independently of them on syllables which do not receive any further emphasis, and which we may say, in so far as they moreover require an accentuation to bring out their particular significance as verbal syllables, assert an effect counter to the verse rhythm, an effect which confers on the whole a novel and unique vitality.

To appreciate the beauty of rhythm in all the above aspects is for our modern ears a very difficult matter, because in modern languages the elements which combine to produce. this kind of metrical effect are no longer in some measure present in the sharp and secure insistence they possessed for the ancient world; rather we have other means substituted for them, in order to satisfy other demands of artistic taste.

(*ββ*) But over and above all this, paramount over all valid claims of syllables and words within their metrical position, there is, secondly, the worth of that significance we gather from the line or verse as *poetical idea.* It is in relation to this, which the language implies, that its other metrical effects are either emphasized or, comparatively speaking, are restrained as void of significance; and it is by this means alone that the finest perfume of spiritual vitality is instilled through the poetry. But notwithstanding this fact, such poetical effect is not to be carried so far that it directly contradicts in this respect the rules of metrical rhythm.

(*γγ*) Moreover, a *definite* type of *content* corresponds with the entire character of a particular verse measure, particularly from the point of view of rhythmical movement, and above all that particular kind implied in the movement of our feelings. Thus, for example, the hexameter, in the tranquil wave of its forward stream, is particularly adapted to the even flow of epic narration. Where, however, it is more in the nature of the strophe in its association with the pentameter and its symmetrically consistent caesura, it is, in its none the less generally simple regularity, fitted to express elegiac emotion. The iambic again moves forward with rapidity, and as such is peculiarly suitable to dramatic dialogue. The anapaest indicates the clear-slipping march of joyful exultation. Other characteristics may readily be associated with other modes of verse-measure.

(*γ*) *Thirdly*, this province of rhythmical versification is not confined to the mere configuration and vivication of time-intervals; it embraces the actual musical sound of syllables and words. In respect to such sound, however, the classic languages, in which rhythm is retained, as above described, as an essential feature, offer a real contrast to other more recent ones more conspicuously adapted to rhyme.

(*αα*) In the Greek and Latin languages, for example, the stem syllable is modified, by virtue of its modes of inflexion, through an abundance of

variously toned syllables, which of course possess an independent meaning, but only as a modification of such syllable; this consequently, it is true, asserts its force as the substantive significance of that variously expanded sound, but it does not, so far as its sound is concerned, stand forth as such in pre-eminent and unique ascendancy. When we hear, for example, the word *amaverunt*, three syllables are attached to the word, and the accent is already substantially differentiated throughout the number and extension of these syllables in direct relation to the stem syllable, even assuming no naturally long ones had been included, by which means the *fundamental significance* and the emphasis of *accent* are *separated* from each other. In such a case consequently, and in so far as the accentuation is not identical with the *main* syllable, but falls on another, which merely expresses an *incidental* significance, the ear can from this basis at once listen to the sound of the different syllables and follow their movement, retaining, as it does, perfect liberty to attend to that prosody peculiar to the word or phrase, and finding itself then invited to incorporate within its rhythm these naturally long and short syllables.

(*ββ*) The case of our modern German language is wholly different. That which in the Greek and Latin languages is expressed, as above described, by means of the prefix and suffix, and other modifications, is in more modern languages for the most part resolved in verbs of the stem syllable; the result of this is that the inflexion syllables that have been in the former case unfolded in one and the same word, with collateral meanings of a varied character, are now split up and isolated in separate words. As illustrations of this we have the constant employment of many subsidiary words denoting time, the independent indication of the optative by means of distinct verbs, the separation of pronouns, and other examples. By such means, on the one hand, the word — which in the previous case adduced was expanded in all the variety of tone which attached to its many syllables,

under which every accent of the root, that is the root idea, was cancelled — persists as a simple totality concentrated in itself, without appearing as a series of tones, which being, as they are, mere modifications, do not, by virtue of their specific *sense,* assert an influence with such a strength that the ear is unable to attend to their independent tonal quality and its temporal movement. And, on the other hand, on account of this concentration the main significance is moreover of such a force that it attracts the fall of the accent upon itself exclusively; and just because the emphasis is thus fastened upon the fundamental sense this very coalescence does not suffer the quantity of the other syllables, whether long or short ones, to appear; they are simply overwhelmed. The roots of the majority of words are unquestionably as a general rule short, compact,[25] of one or two syllables. If thus, as is for instance pre-eminently the case with our mother tongue, these root-stems appropriate almost invariably the accent to themselves, such an accent is to an overwhelming degree one of the sense, *significance',* not a definition, however, in which the medium — that is, the utterance as sound — would be free, or could assert the relation of the length, shortness, or accentuation of syllables independently of the intelligible content of the words. Consequently a rhythmical configuration of time-movement and emphasis liberated from the stem syllable and its meaning can here no longer be maintained. We have merely left us, in contradistinction to the former hearing of the ample sound and duration of such long and short beats in their varied juxtaposition, a general impression of sound,[26] which is apprehended. entirely aloof from the accented fundamental syllable with its weight of significance. And, indeed, apart from this, as we have seen, the ramification of the stem into syllables as modified into particular words is also an independent process. Such words receive thereby an independent worth, and, while preserving their own significance, they make us at the same time hear the identical coalescence of meaning and accent, which we

have observed in the case of the stem or root word around which they are ranged. We are therefore forced to restrict our attention to the sense of every word; and, instead of being occupied with the natural length and shortness of syllables and their sensuous[27] accentuation, are only able to hear the accent asserted by the main and substantive meaning.

(*γγ*) In such modern languages the element of rhythm has little room for its display, or at least the soul has little freedom left to expatiate within it, because, as observed, time and the equable stream of syllabic sound as emitted from its movement is superseded[28] by a more ideal relation — that is to say, by the sense and meaning of the words, and thereby the force of the more independent configuration of rhythm is suppressed. We may in this connection compare the principle of rhythmical versification with the plastic arts. We find in both that the ideal significance is not as yet asserted in its independence, nor does the former expressly define the length and accent of syllables, but rather the meaning of the words is wholly blended with the sensuous medium of the inherent time duration and sound, with a result that does complete justice to the claim of such externality, wholly absorbed in the ideal form and movement of the same. If, however, such a principle is renounced, and yet despite of this, but in accordance with the necessary demand of art, the sensuous medium is permitted to retain a certain force of resistance as against the exclusive assertion of ideal content,[29] in order to this end to divert the ear's attention, — in the case that is, where what we may call the plastic moment of that more ancient mode of syllabic quantity, as it is on its own account, and the tonal quality inseparable from the general rhythm rather than independently asserted — when this, as I say, has been destroyed, then we have no other means[30] at hand save the express and artistically configurated sound of articulate speech simply, and retained as such in its isolation. And this leads us to our second main type of versification — in other words, *rhyme.*

(b) Rhyme

From an objective standpoint it is possible to seek to explain the need of a novel treatment of language from the deterioration into which the classical languages fell through their contact with foreign relations. Such a development, however, lies in the nature of the facts themselves. The earliest example of conformity with the ideality of its content attempted by poetry is to be traced in the length and shortness of syllables in independence from their significance, for the mutual relations of which, caesurae and so forth, art elaborates its rules, rules which it is true generally coincide with the character of the content in its broad outlines, but which none the less, in matters of individual detail, do not suffer either the length or shortness of a syllable, nor its accent, to depend exclusively on the intelligible significance making such a formal aspect subordinate, to the point of entire detachment, to the same.[31] The more ideal, however, and spiritual the represented idea becomes, the more it tends to detach itself from this objective aspect, which increasingly fails to present such ideality in plastic guise, and finally reaches a point of self-concentration in which the, so to speak, corporeal element of speech is in a measure wholly wiped away, and for the rest merely asserts that wherein the intelligible significance is reposed as necessary to its communication; all else is only admitted, by way of by-play, as insignificant. Now romantic art, in respect to the entire type of its conception and presentation, effects a similar passage over to this concentrated synthesis of ideality, when it sets out in search for the material which corresponds to this subjective content in audible sound.[32] Following these lines romantic poetry also, inasmuch as it generally lays most stress on the ideal tones[33] of feeling, becomes absorbed in its preoccupation[34] with the distinct and independent ring and tones of letters, syllables, and words; perfecting such a process to its final satisfaction, as it learns, either in their association with ideality, or in their

connection with the architectonically intelligible penetration[35] of such music, to separate such syllabic and other verbal sounds or to relate or interlace them one with another. From this point of view we may affirm that it is not simply by way of accident that rhyme is elaborated in romantic poetry. It is a necessary feature of it. The requirement of soul-life, to discover itself again, is thereby more fully asserted, and finds a real source of satisfaction in the identity of the rhyme, which declares an indifference[36] to the unyielding laws of the time-measure, and, by virtue of its recurrence of similar sounds, gives exclusive effect to an effort which conducts the conscious self back to itself. It is by this means that versification is made to approach more closely the musical art as such, that is, the vivid tones of soul-life itself, and is, from this point of view, liberated from the, relatively speaking, gross material of human speech, in other words from what we have referred to as the natural measure of quantity.

With regard to points of special interest in this subject, I will confine myself to the following general observations:

First, upon the origin of rhyme.

Secondly, upon a few more definite features by which we may distinguish the sphere of rhyme from that of rhythm in verse.

Thirdly, upon the types under which we may classify rhyme generally.

(α) We have already seen that rhyme belongs in its form to the art of romantic poetry, which requires such a more pronounced emphasis of its configurated syllabic sound posited thus on its own account. And it is thus effected to the extent that the ideal activity of volition[37] discovers its own presence by this means in the objective medium of tone. Where such a need is asserted we have a mode of speech in part meeting absolutely the conditions of form I outlined above when discussing the necessity of rhyme; and in addition it makes use of the old forms of language at hand, the Latin for example, which, though of other constitution and mainly

applicable to rhythmical versification, it employs agreeably to the character of the new principle, or reconstructs the same so far into a new language that the element of rhythm disappears, and rhyme becomes, as in the Italian and French languages, the matter of all importance.

(*αα*) In this respect we find throughout Christendom that rhyme is introduced into Latin versification at a very early date with much insistence, although, as observed, it rested on other principles. These principles, however, are rather adapted from the Greek language; and, so far from testifying to the fact that they originated from the Latin speech itself, rather prove, under the modified character they possess, a tendency which itself approaches the romantic type. In other words, the poetry of Rome, on the one hand and in its earliest days, discovered its source not in the natural length and shortness of syllables, but rather measured the value of syllables relatively to their accent; and in consequence of this it was only through a more accurate knowledge and imitation of Greek poetry that the prosodical principle of this was received and followed. And, moreover, the Romans rendered more obdurate the flexible, joyous sensuousness of Greek metres, more particularly by their use of more insistent pauses at the caesura, as we find such not only in the hexameter, but also in the alcaic and sapphic metres, hardening the effect thus to a structure of more stringent outline and more severe regularity. And indeed, apart from this, even in the full bloom of Latin literature, and from their poets of finest culture, we have already plenty of rhymes. Thus from Horace, in his *Ars poetica* (verses 99-100), we get the following:

Non satis est, pulchra esse poemata: dulcia *sunto,*
Et quocunque volent, animum auditoris *agunto.*

Though the poet was probably quite unconscious of the fact, it is none the less a strange coincidence that, in the very passage in which Horace

enforces the obligation that poems should be *dulcia*, we discover a rhyme. Similar rhymes occur in Ovid with still more frequency. Even assuming such to be accidental, the fact remains that they appear to have been not offensive to Roman ears, and might consequently be permitted, although as isolated exceptions, to slip into the composition. Yet the profounder significance of romantic rhyme is absent from such playful exceptions. The former does not assert the recurrent sound merely as sound, but the ideal content or meaning implied in it. And it is precisely this which constitutes the fundamental difference between modern rhyme and the very ancient rhyme of the Hindoos.

As for the classical languages, it was after the invasion of barbarism, and on account of the destruction of accentuation and the assertion of that uniquely personal note of emotion referable to Christianity, that the rhythmical system of verse passed into that of rhyme. Thus, in his hymn to the Holy Spirit, Ambrosius entirely regulates the versification according to the accent of the meaning expressed, and breaks into rhyme. The first work of St. Augustine against the Donatists is in the same way a rhymed song; and also the so-called Leonine versicles, as expressly rhymed hexameters and pentameters, are easily distinguishable from the accidental exceptions of rhyme previously noticed. These and other examples like them mark the point of departure of rhyme from the more ancient rhythmical system.

(*ββ*) Certain writers have no doubt attempted to trace the origin of the new principle of versification in *Arabian* literature. The artistic education, however, of the famous poets of the East is of later date than the appearance of rhyme in western Christendom; and any Mohammedan art of a more early time exercised no real influence on the West. We should, however, add that we find from the first in Arabian poetry essential affinities with the romantic principle, in which the knights of Europe, at the time of the crusades, very readily made themselves at home; and consequently it is not

difficult to understand how, in the affinity of spiritual tendencies[38] which they shared, and in which the poetry of Eastern Mohammedanism no less than Western Christianity finds its source, though removed in the world from each other, we meet for the first time and on its own independent footing a novel type of verse writing.

(*γγ*) A *third* source, to which again, independently of either the influence of the classic languages or the Arabic, we may trace the origins of rhyme and all that it implies, are the *Germanic* languages, as we find them in their earliest Scandinavian development. As illustration of this we have the songs of the ancient Edda, which, though only in more recent times, collected and edited, unquestionably date from a former age. In these, as we shall see later on, it is not, it is true, the genuine rhyme-sound which is elaborated in its perfection, but rather an effective emphasis upon particular sounds of language, and a regularity defined by rule, with a definite repetition of both aspects.

(*β*) Yet more important than the question of origin is the characteristic *difference* between the new system and the old. I have already adverted to the fundamental feature of importance here; it only remains to establish it more narrowly.

Rhythmical versification attained its most beautiful and richest development in the field of Hellenic poetry, in which we may discover the most eminent features of the type wherever it obtains. Briefly they are as follows:

First, the sound, as such, of letters, syllables, or words does not here constitute its material, but rather the syllabic sound in its *temporal duration*, so that attention must neither exclusively be directed to particular syllables or words, nor to the purely qualitative similarity or identity of their sound. On the contrary, the sound still remains in inseparable union with the static

time-measure of its specific duration; and in the forward movement of both the ear has to follow the value of every separate syllable no less than the principle which obtains in the rhythmical progression of all equally together. *Secondly*, the measure of long and short syllables, no less than that of rhythmical rise and fall, and varied animation derived from more deliberate caesurae and moments of pause, depends upon the *natural* element of the language, without permitting any introduction of that type of accentuation, by virtue of which the actual *meaning* of the word leaves its impress on a syllable or a word. The versification asserts itself in its collocation of feet, its verse accent, its caesurae, and so forth in this respect as fully independent as the language itself, which also, outside the domain of poetry, already accepts accentuation from the natural quantity of syllables and their relations of juxtaposition, and not from the significance of the root-syllable. On this account, *thirdly*, we have as the vital emphasis of certain syllables, first, the verse accent and rhythm, and, secondly, all other accentuation, both of which aspects, in their twofold contribution to the varied character of the whole, pass in and out of one another without any mutual derangement or suppression; and in like manner respectively they satisfy the claim of the poetical imagination in fully admitting the expressiveness due, by virtue of the nature of their position and movement, to words which, in respect to their intelligible meaning, are of a greater importance than others.

(*αα*) The first alteration, then, effected by rhymed verse in the previous system is this indisputable validity of *natural quantity*,[39] If, therefore, any time-measure at all is permitted to remain, it is compelled to seek for a basis for such quantitative pause or acceleration, which it refuses any longer to find in the natural quantity, of syllables, in some other province. And this, as we have seen, can be no other than the intrinsic meaning of syllables and

words. It is this *significance* which in the final instance determines the quantitative measure of syllables, so long as such is still regarded as essential at all, and by doing so transfers the criterium from the purely objective medium[40] and its natural structure to the ideal subject-matter.

(*ββ*) A further result follows from this of yet more importance. As I have already pointed out, this collocation of the emphasis on the significant stem-syllable dissipates that other independent diffusion of it in manifold forms of inflexion, which our rhythmical system is not yet forced to treat as negligible, in contrast to the stem, because it deduces neither the natural quantity of syllables nor the accent which it asserts from the intelligible significance. In the case, however, where such an explication,[41] with its co-ordination in verse-feet according to the quantity of syllables in their natural stability, falls away the entire system therewith necessarily collapses, which reposes on the time-measure and its laws. Of this type, for example, is French and Italian poetry, the metre and rhythm of which are absolutely non-existent as understood by the ancients. The entire question is here merely one of a definite number of syllables.

(*γγ*) For such a loss there is only one possible compensation — that of *rhyme.* In other words, if — this is one aspect — it is no longer time-duration which receives objective expression, by means of which the sound of syllables flows on freely in the even movement that intrinsically belongs to them; if, furthermore, the intelligible significance dominates over the stem-syllables, and coalesces with the same without further organic expatiation into a determinate unity, we have no sensuous medium, such as is able to maintain itself independently of the time-measure, no less than this accentuation of the stem-syllables, finally left to us other than just this syllabic sound.

Such a sound, however, if it is to secure an independent attention, must, in the *first* place, be of a far more insistent kind than the interchange of

different tones, such as we met with in the older verse metres; and its assertion must be of a far more overwhelming character than the stress of syllables can lay claim to in ordinary speech. What we now require has not only to compensate us for the loss of the articulate time-measure, but it further undertakes to reassert the sensuous medium in its opposition to that unqualified predominance of the accentuated significance. For when once the conceptive content has essentially attained the ideality and penetration of mind,[42] for which the sensuous aspect of speech is of no importance, the verbal sound must enforce itself still more positively and coarsely as distinct from this ideality in order to arrest our attention at all. In contrast, therefore, to the gentle movements of rhythmical euphony, rhyme is a crude expedient,[43] which requires an ear by no means either so trained or sensitive as that presupposed by Greek verse. *Secondly,* though it is true that rhyme does not here assert itself so much as distinct from the meaning of the stem-syllables simply as it does from the entire ideal content, yet it does at the same time so far assist the natural verbal sound as to win for it a relatively secure stability. But this object can only be attained if the sound[44] of particular words affirms itself in exclusive distinction from the resonance of other words, and thus secures an independent existence, by virtue of which *isolation* it satisfies the claims of the formative aspect of the verbal medium in forceful beats of sound. Rhyme is therefore, at least in its contrast to the evenly transfused movement of rhythmic euphony, a detached exhibition of exclusive tonal expression. *Thirdly,* we found that it was the ideality of the conscious self which, by virtue of its effort of ideal synthesis, came into its own, and discovered its personal satisfaction in such recurrences of sound. If, then, the means used in the older type of versification, with its copious variety of structure, disappear, there only remains, if we look at poetry, under the aspect of its *medium,* to support this principle of self-recovery, the more formal repetition of wholly identical or similar sounds, whereby again

we are able to unite under an intelligible scheme[45] the assertion and relation of closely associated meanings in the rhyme-sounds of expressive words. The metre of rhythmical verse we may regard as a variously articulate interrelation of manifold syllabic quantities. Rhyme, on the contrary, is from one point of view more material;[46] yet, on the other hand, is itself more abstractly placed within this medium. In other words, it is the mere recollection of mind and the ear of the recurrence of identical or related sounds and significations — a recurrence in which the poet is conscious of his own activity, recognizes, and is pleased to recognize, himself therein as both agent and participant.

(*γ*) Finally, on the question of the particular *types* under which we may classify this more modern system of romantic poetry, I only propose to advert briefly to what appears to me of most importance in respect to alliteration, assonance, and ordinary rhyme.

(*αα*) The first, or at least the most thorough, example of *alliteration* is that we find elaborated in the earliest Scandinavian poetry, where it supplies the fundamental basis, whereas assonance and the terminal rhyme, albeit these two aspects play a by no means unimportant part, are, however, only present in certain particular kinds of such poetry. The principle of alliterative rhyme, letter rhyme, is rhyme in its most incomplete form, because it does not require the recurrence of the entire syllable, but only that of one identical letter, and primarily the initial letter only. Owing to the weakness of this type of recurrent sound it is, in the first place, therefore necessary that only such words should be used in its service, which already independently possess an express accent on their first syllable; and, secondly, these words must not be remote from one another, if the identity of their commencement is to make a real impression on the ear. For the rest, alliterative letters may be a vowel, no less than a double or single consonant; but it is primarily consonants which are of most importance in

the scheme. Based on such conditions, we find in Icelandic poetry[47] the fundamental rule that all alliterative rhymes require accentuated[48] syllables, whose initial letters must not in the same lines occur in other substantives which have the accent on the first syllable; and, along with this, of the three words, the initial letters of which constitute the rhyme, two must be found in the first line, and the third, which supplies the dominant alliteration, must be placed at the commencement of the second line. We may add further that, in virtue of the abstract character of this identical sound of initial letters, words are generally made alliterative proportionally to the importance of their signification. We find, therefore, that here, too, the relation of accented sound to the meaning of words is not entirely absent. I cannot, however, pursue this subject into more detail.

(*ββ*) *Secondly*, *assonance* has nothing to do with initial letters, but makes a nearer approach to rhyme in so far as it is a recurrence in identical sound of the same letters in the middle or at the termination of different words. It is not necessary, of course, that these assonant words should in all cases come at the conclusion of a line; they may fall into other places. Mainly, however, it is the concluding syllables of lines which come into this mutual relation of assonance, as contrasted with alliteration which is effective rather at the line's commencement. In its richest elaboration we may associate this assonance of language with the Romance nations, more especially the Spanish, whose full-toned language is peculiarly adapted to this recurrence of the same vowels. As a rule, no doubt assonance is here restricted to vowels. But the language further permits of other variety of assonance, not only that of vowels, but also that of identical consonants and consonants in association with one vowel.

(*γγ*) That which, as above described, alliteration and assonance are only able to establish with incompleteness is abundantly fulfilled by *rhyme.* In it,

and expressly to the exclusion of initial letters, we have asserted the wholly equable sound of entire verb stems,[49] which are, by virtue of this equability, brought into an express relation with their tonal utterance. We have no mere question now of the number of the syllables. Words of one syllable, no less than others of two or more, may be rhymed. By this means we not only get the masculine rhyme, which is restricted to words of one syllable, but also the feminine rhyme, which embraces words of two syllables, as also the so-called gliding rhyme, which reaches to three or even more syllables. It is in particular the languages of Northern Europe which incline to the first type, Southern languages to the second, such as the Italian and Spanish. The German and French languages would appear to lie between these two extremes. Rhymes of more than three syllables are rarely to be met with in any language.

The position of the rhyme is at the conclusion of the lines, in which the rhyming word, although there is certainly no reason that it should ever concentrate in itself the ideal expressiveness of the significance, nevertheless does attract attention to itself so far as the verbal sound is concerned; and, furthermore, it makes the different verses or stanzas follow one another either in accordance with the principle of a wholly abstract recurrence of the same rhyme, or by uniting, separating, and mutually relating them in a more elaborate mode of regulated change, and variously symmetrical interweaving of different rhymes with correspondent relations, sometimes more near, at others more remote, of every degree of complexity. In such a process the particular rhymes will at one point stare us in the face at once, or they will appear to have a game of hide-and seek; so that in this way our ear, as it listens, will at one time receive instant satisfaction, at another it will only find it after considerable delay, wherein the expectation will, as it were, be coquetted with, deceived, and kept on the stretch, until

the assured end from point to point of artistically arranged recurrence is reached, and with it the hearer's approval.

Among the various types of the poetic art it is pre-eminently *lyric* poetry, which, by virtue of its ideality and personal quality of expression, most readily avails itself of rhyme, and thereby converts language itself into a music of emotion and melodic symmetry, a symmetry not merely of time-measure and rhythmical movement, but of the kind of resonance which finds a responsive echo in the inner life itself. To promote this, therefore, the art elaborates in its use of rhyme a more simple or complex system of strophes, every one of which is part of one organic whole. Examples of such an interplay of melodic sound, whether steeped in emotion or rich in ingenuity, are the sonnet, canzonet, triolet, and madrigal. Epic poetry, on the contrary, so long as it does not mingle lyrical subject-matter with its more native character, preserves a more equable advance in its construction, which does not easily adapt itself to the strophe. We have an obvious illustration of this in the triplet stanzas of Dante's "Divine Comedy," as contrasted with the lyrical canzonets and sonnets of the same poet. However, I must not permit myself to go further into detail.

(*c*) Now that we have in the above investigation separated rhythmical versification from rhyme, and *contrasted* the same, we may now proceed, *thirdly*, to ask ourselves whether a *combination* of the two is not also intelligible, and, indeed, actually employed. The existence of certain more recent languages will render exceptional and important aid to the solution; in other words, we cannot deny to these either a partial reassertion of our former rhythmical system, or, in certain respects, an association of the same with rhyme. We will, for example, confine our attention to our mother tongue, and, in reference to the first-mentioned aspect, it will be sufficient to recall Klopstock, who would have as little of rhyme as possible; who not merely in epic, but also in lyrical poetry, set himself to imitate the ancients

with the greatest enthusiasm and persistency. Voss and others have followed in his steps, ever striving to enforce with increased strictness principles upon which to base this rhythmical treatment of our language. Goethe, on the contrary, never felt quite himself in his classical syllabic measures. He asks himself, not without reason:

Stehn uns diese weiten Falten
Zu Gesichte, wie den Alten?[50]

(*α*) I will in this connection merely reiterate what I already have observed upon the distinction which exists between ancient and more modern languages. Rhythmical versification is based upon the *natural* quantity of syllables, possessing therein an essentially stable criterion, which the ideal expression can neither limit, alter, or weaken. Such a natural measure is, however, abhorrent to more recent languages; in these it is only the *verbal* accent of the ideal significance, which makes one syllable long in its contrast to others, which are defective in such significance. Such a principle of accentuation, however, does not supply any audible compensation for the absence of the natural quantity, or rather it adds to the actual uncertainty of such a measure. For the more strongly emphasized significance of a word can at the same time make another short, despite the fact that, taken by itself, it possesses a verbal accent, so that the criterion accepted is wholly one of mutual relation. *Du liebst,* can, for instance, according to the stress of the emphasis which is thrown, according to the sense intended, either on both words, or one or the other, be a spondee, iambus or trochee. No doubt the attempt has been made, even in our own tongue, to return to the *natural* quantity of syllables, and to create rules with this intent; but in the presence of the overwhelming importance that the intelligible significance and the accent it asserts has secured such a

reference to theory is quite impracticable. And in truth this agrees with the state of the facts. If the natural measure is really to constitute the essential basis, the language ought not as yet to have become such an instrument of soul expression as it is of necessity in our own times. Once allow, however, that it has already in its course of development thus secured such a mastery of the intelligible purport over the sensuous or native material, and it follows that the fundamental test for the value of syllables is not to be deduced from the objective quantity itself, but rather from that whereof words are themselves indicative as means. The emotional impulse of a free intelligence refuses to allow the temporal activity of language, as such, to establish itself in the independent form of its native and objective reality.

(*β*) Such a conclusion, however, does not necessarily imply that we are forced to oust altogether from our German language the rhymeless rhythmical treatment of the syllabic measure; it merely in essential respects points to this, that it is not possible, conformably with the character of the structure of our modern speech, to retain the plastic consistency of the metrical medium as it was secured by the ancient world. We must consequently seek for and elaborate some further element in poetical composition by way of compensation, which on its own independent account is of a more ideal[51] character than the stable natural quantity of syllables. Such an element is the accent of the verse, no less than the caesura, which as now constituted, instead of moving independently of the verbal accent, coalesce with the same, and thereby receive a more significant, albeit a more abstract assertion, in virtue of the fact that the variety of that previous threefold accentuation, which we discovered in the rhythmical type of classical poetry, on account of this very coalescence necessarily disappears. It, however, equally follows as a result that we only retain the power with conspicuous success to imitate the rhythmic movement of such poetry where its impression on our ear is most emphatic.

We no longer possess, that is to say, the stable quantitative basis for its more subtle distinctions and manifold connections, and the more crude mode of accentuation, which we do possess in its place, to emphasize our measure, is intrinsically no sufficient substitute.

(*γ*) To state, then, finally, what this actual *association* of the rhythmical mode of verse with rhyme is, we may go so far as to affirm that it is the absorption, although to a limited extent, by the more modern form of versification of the more ancient one.

(*αα*) The predominant distinction of the natural syllabic quantity by means of the verbal accent is in fact not an entirely satisfactory principle of the *mere medium.* It does not arrest the ear's attention, even on the side of sense simply, so far as to make it appear, absolutely and everywhere unnecessary, where the ideal aspect of the poetical content is paramount, to summon the complementary assistance of the sound and response of syllables and words.

(*ββ*) It is, however, at the same time necessary in the interest of metre that an equally strong contrasting force should be set up to that of the rhyme sound. In so far, however, as it is *not* the distinction of syllables in their natural quantity and *its variety*, which has to be co-ordinated and made predominant, we have, in respect, to this temporal relation, no other expedient left but the *identical repetition* of the same time-measure; in this the element of accented *beat* will tend to assert itself in a far more emphatic degree, than is compatible with the rhythmical system. As an illustration we have our German rhymed iambics and trochaics, in the recitation of which far more beat stress is admitted than is proper to the scansion of the unrhymed iambics of the ancients, although the caesura pause is capable of bringing into emphatic relief isolated words whose accent is mainly referable to their meaning, and is capable of further making all that remains dependent upon them a resisting effect to the abstract equality of the verse,

and by so doing introduces a varied animation. And as in such a particular case, so we may assert generally, the time-beat cannot be of actual service in poetry with the force that is required of it in most musical compositions.

(*γγ*) Although, however, we may affirm it as a general rule that rhyme should be associated merely with such verse metres, which, by virtue of their simple changes of the syllabic quantity and their continuous recurrence of similar verse feet, do not on their own independent account give sufficiently effective modality to the element of sensuous medium in modern languages which admit at all of rhythmical treatment, yet the application of rhyme to the more profuse syllabic metres imitated from classical models, as, for instance, to borrow one example only, the alcaic and sapphic strophe, will not merely appear superfluous, but even an unresolved contradiction. Both systems repose on opposed principles, and the attempt to unite them in the way suggested, can only involve us in a like opposition, which can produce nothing but a contradiction we are unable to mediate, and which is therefore untenable. It follows, therefore, that we ought only to make use of rhyme in cases where the principle of the older versification merely makes itself effective in more remote implication, and through a transitional process essentially deducible from the system of rhyme.

The above, then, are the points which we have sought to establish as, in a broad sense, of most vital concern to poetical expression in its contradistinction from prose.

[1] *Bildlich,* here not so much creative as simply plastic or constructive.

[2] *Vorliebe.* His interest must be already centred in it.

[3] *Bildlichkeit*, *i.e.* their claims as images of something else.

[4] *Vertauscht.* I have translated "exchanged," but Hegel may mean "mistaken for."

[5] It is not very clear what Hegel means by the word *Bezeichnungen.* "Turns of expression," which first occurred to me, appears to be covered by *Flexionsformen* lower down.

[6] *Gedrungenen.* The idea is suppression into a compact mass — a cloud unable to burst save in occasional flashes.

[7] I presume Hegel refers here to the synthetic arrangement of genuine paragraphs rather than phrases, composition generally.

[8] *Das eigentliche Wort*. The word, that is, which expresses the fact in its immediacy.

[9] More literally, "being remoulded with the life and wealth of Spirit."

[10] *Besonnenheit*, *i.e.,* real thought-fullness.

[11] *Der künstlerischen Ruhe.* The personal predilection of Hegel for classic art here once more asserts itself.

[12] The German word is *Sinnen*, but I think, though the emotional sense is partly implied, the main emphasis is on a presiding mind — or rather a wide-visioned genius.

[13] *Eine sprudelnde Anschauung.* A view of things that bubbles forth like a fountain.

[14] That is, the medium of literary form.

[15] *Ein hartes Band.* The idea is not so much difficult as unyielding, unmalleable.

[16] *Zum Ernste des Inhalts*. That is, the earnestness of a product of mind as such. Hegel seems to contrast with this the spontaneity of an art which, as inspired by genius, comes to us with the freshness of Nature herself, take Shakespeare's songs for example.

[17] *Ungebunden.* That is, it is contingent.

[18] Hegel calls this the *Verstandesaccent*, and speaks of this importance (*Bedeutsamkeit*) as a product of the syllables.

[19] I presume the words *das für sich gestaltete Klingen* refer to rhyme.

[20] *Eine Sammlung in sich*, that is, an independent collection or aggregate.

[21] *Anheben* may possibly mean appearance in the defined series generally.

[22] By *Versen* Hegel means rather lines than a number of them.

[23] The dative appears to be a misprint. The passage should be read *der* and *die,* instead of *dem* and *der*.

[24] I am not quite sure what Hegel refers to in what he describes as *das Hinübergreifen des Wortes.* I presume he means what are known as weak endings to a line.

[25] *Gedrungen.* I suppose this is the meaning. The entire passage is a difficult one to follow.

[26] *Ein allgemeines Hören.*

[27] That is, the accent of the syllables as a mere medium of uttered speech.

[28] Lit., has its flank turned, *überflügelt.*

[29] *Die blosse Vergeistigung.*

[30] No other means to divert the ears attention. The sentence is rather involved, and I have not seen my way to simplify it.

[31] *Abstract unterworfen.* Hegel apparently means abstract as detached from the natural medium of language — becoming thereby the abstract symbol of idea exclusively.

[32] As in musical art.

[33] *Seelen-tonen*, *i.e.,* the wave and flow of the emotional life itself.

[34] *In das Spielen*. Hegel repeats his use of the expression above, *beiher Spielen*, lit., the playing with not as a toy but as something serious.

[35] I suppose this is the meaning here of *Sharfsinn,* but “subtlety” may be included.

[36] Indifferent, that is, as asserting the creative freedom of the poet, he can select his own rhymes as he wills. Hegel, however, seems rather to miss the essential spontaneity of really good blank verse.

[37] So I translate *die innere Subjectivität*, but it may refer perhaps to the entire creative personality.

[38] That is, I presume, their relation to romantic art.

[39] That is, the primary feature changed is that of the validity of natural quantity.

[40] *Dem Äusseren Daseyn.* That is, of language.

[41] *Entfaltung.* Such an explication of rhythmical euphony as the previous system discloses.

[42] *Geistes.* All that pertains to conscious life.

[43] Lit., a blunt or coarse sound, *ein plumpes Klingen.*

[44] *Tonen* implies sound no less than accent. I have rendered it in various ways.

[45] *Von Seiten des Geistes.* Perhaps rather "as aspects of the poet's intelligence" — that is, with reference to the self-assertion above explained.

[46] More nearly related to the natural medium of language.

[47] *Die Verslehre der Isländer v. Rask, verd. von Mohnike*, Berlin, 1830, pp. 14-17.

[48]*Betonte*, see above note on *Tonen.*

[49] *Stämme*, the stem of verbs, rather than the root of substantives, which would be more correctly *stammwort.*

[50] "Do we moderns face broad reaches such as these, as did the ancients?" *Falten*, folds, expatiation of subject-matter. I presume, though I do not recall the context, that the allusion is mainly to elegiacs.

[51] *I.e.*, more related to active intelligence.

III

THE SEVERAL GENERIC TYPES OF POETRY

The two fundamental aspects, according to which we have hitherto examined the poetical art were, in the first instance, that of poetical significance or content *in the broadest sense*, the nature of the outlook of a poetical composition and the creative activity of the poet; secondly, poetical *expression,* not merely respectively to the ideas which have to be embodied in *words,* but also to the modes under which they are expressed and the character of *versification.*

I. What we, above all, in these respects endeavoured to enforce consisted in this, that poetry has to embrace the ideality of conscious life as its content; yet, in its artistic elaboration of the same, it cannot rest satisfied with the objective form of direct perception as other plastic arts; nor can it accept as its form the emotional ideality which alone reverberates through our soul-life, nor yet that of thinking and the relations of reflective thought. It has to maintain a mediate position between the extremes of immediate objectivity and the inner life of feeling and thought. This intermediate sphere of conception overlaps both sides. From thought it borrows the aspect of ideal *universality,* which binds together the immediate particularity of the senses in more definitive simplicity; while, on the other hand, its mode of envisagement shares with plastic art the haphazard[1] juxtaposition of objects in space. The poetic imagination, moreover, is essentially distinct from thinking in that it permits, under the mode of sensuous apprehension from which it starts, particular ideas to remain in an unrelated series or contiguity; pure thinking, on the other hand, demands and promotes the reciprocal dependence of determinate concepts on each other, an interstructure of relations, consequential or conclusive judgments, and so forth. When, therefore, the *poetical* imagination in its art-products

renders necessary an ideal unity of all particularity, such integration may easily meet with obstruction by virtue of the above-mentioned diffuseness[2] which the nature of its content forbids it wholly to eschew; and it is just this which puts it in the power of poetry to embody and present a content in organic and vital inter-connection of successive aspects and divisions, yet impressed at the same time with the apparent independence of these. And by this means it is possible for poetry to extend the selected content at one time rather in the direction of abstract thought, at another rather under the condition of the phenomenal world, and consequently to include within its survey the most sublime thoughts of speculative philosophy, no less than the external objects of Nature, always provided that the former are not put forward in the logical forms of ratiocination and scientific deduction, or the latter as void of all vital or other significance. The function, in short, of poetry is to present a complete world, whose ideal or essential content must be spread before us under the external guise of human actions, events, and other manifestations of soul;life, with all the wealth and directness compatible with such art.

2. This explication, however, does not receive its sensuous embodiment in stone, wood, or colour, but exclusively in language, whose versification, accentuation, and the rest are in fact the trappings[3] of speech, by means of which the ideal content secures an external form. If we ask ourselves now, to put the thing somewhat crudely, where we are to look for the *material* consistency of this mode of expression, we must reply that language is not essentially on all fours with a work[4] of plastic art, independent, that is, of the artistic creator, but it is the *life of our humanity itself* the individual speaker alone who is the vehicle of the sensuous presence and actuality of a poetical work. The compositions of poetry must be recited, sung, acted, reproduced, in short, by living people, just as the compositions of music are so reproduced. We are no doubt accustomed to read epic and lyric poetry,

and only to hear drama recited and to see the same accompanied by gesture. Poetry, however, is essentially and according to its notion, *sonorous expression*, and we may, in particular, not dispense with this, if a complete exposition of the art is our aim, for the reason that it is the aspect and the only aspect, under which it comes into genuine contact with objective existence. The printed or written letter is, no doubt, also in a sense objectively present, but it is merely as the indifferent symbol of sounds and words. We no doubt have in a previous passage regarded words as the purely external means which give us the signification of ideas. We must not, however, overlook the fact that poetry, at any rate, so informs the temporal element and sound of these signs, as to ennoble them in a medium suffused with the ideal vitality of that, whereof, in their abstractness, they are the symbols. The printing press merely makes visible to our eyes this form of animation under a mode which, taken by itself, is essentially indifferent and no longer coalescent with the ideal content; it consigns it, in its altered form of visibility, to the element of time-duration and the sound of ordinary speech,[5] instead of giving us in fact the accented word and its determinate time-duration. When we, therefore, content ourselves with mere reading we do so partly owing to the ease with which we can thus picture to ourselves what is real as actually uttered in speech, partly because of the undeniable fact that poetry alone among the arts, in aspects of fundamental importance, is already completely at home in the life of spirit, and neither the impression of it on our sense of sight or hearing give us the root of the matter. Yet for all that, precisely by virtue of this ideality, poetry, as art, ought not wholly to divest itself of this aspect of objective expression, if at least it is anxious to avoid an incompleteness similar to that in which, for instance, the mere outlined drawing attempts to reproduce the picture of famous colourists.

3. As an artistically organic whole referred no longer to a specific type of exclusive execution on account of the onesided character of its medium, the

art of poetry accepts in a general way for its determinate form various types of art-production, and it is consequently necessary to borrow the *criteria* of our *classification* of such *poetical types* or species from the *general* notion of artistic production.[6]

(*A*) In this respect it is, *first,* and from one point of view, the form of objective reality, wherein poetry reproduces the evolved content of conscious life in the ideal image, and therewithal essentially repeats the principle of plastic art, which makes the immediate object of fact visible. These plastic figures of the imagination poetry furthermore unveils as determined in the activities of human and divine beings, so that every thing, which takes place, issues in part from ethically self-subsistent human or divine forces, and in part also, by virtue of obstructive agencies, meets with a reaction, and thus, in its external form of manifestation, becomes an *event,* in which the facts in question disclose themselves in free independence, and the poet retires into the background. To grasp such events in a consequential whole is the task of *Epic* poetry, inasmuch as its aim is just to declare poetically, and in the form of the actual facts, either an essentially complete action, or the personalities, from which the same proceeds in its substantive worth or its eventful complexity amid the medley of external accidence. And by so doing it represents the *objective* fact itself in its objectivity.

And, moreover, the minstrel does not recite this positive world before conscious sense and feeling in a way that would seem to announce it as his personal phantasy, and his own heart's passion; rather this reciter or rhapsodist recites it by heart, in a mechanical sort of way, and in a metre which, while it repeats something of this monotony with its uniformity of structure, rolls onward in a tranquil and steady stream. What, in short, the minstrel narrates must appear as a part of real life, which, in respect to content no less than presentation, stands in absolute independence aloof from himself, the narrator; he is throughout, in relation that is to the facts of

his tale no less than the manner in which he unfolds them, not permitted wholly to identify his own personality with their substance.

(*B*) In direct contrast to epic poetry we have our *second* type, that namely of *lyrical* poetry. Its content is that within ourselves, the ideal world, the contemplative or emotional life of soul, which instead of following up actions, remains at home with itself in its own ideal realm, and, consequently, is able to accept *self-expression* as its unique and indeed final end. Here we have, therefore, no substantive totality, self-evolved as external fact or event, but the express outlook, emotion and observation of the individual's self-introspective life shares in what is substantive and actual therein as its own, as its passion, mood or reflection; we have here the birth of its own loins. Such a fulfilment and ideal process is not adequately realized in a mechanical delivery such as we saw was conceded as appropriate to epic poetry. On the contrary the singer must give utterance to the ideas and views of lyrical art as though they were the expression of his own soul, his own emotions. And inasmuch as it is this *innermost world*, which the delivery has to animate, the expression of it will above all lean to the musical features of poetical reproduction; whether permitted as an embellishment or a necessity we shall here meet with the varied modulation of the voice, either in recitation or song, and the accompaniment of musical instruments.

(*C*) Our *third* and final mode of poetical composition unites the two previous ones in a new totality. In this we not only discover an *objective* exposition, but also can trace its source in the ideal life of particular people; what is objective here is therefore portrayed as appertinent to the conscious life of individuals.[7] To put the case conversely, the conscious life of individuals is on the one hand unfolded as it passes over into actual life experience, and on the other as involved in the fatality of events, which brings about passion in causal and necessary connection with the

individual's own action. We have here, therefore, as in Epic poetry, an action expanded to our view in its conflicts and issues; spiritual forces come to expression and battle; the element of contingency is everywhere involved, and human activity is either brought into contact with the energy of an omnipotent destiny, or a directive and world-ruling Providence. Human action, however, does not here only pass before our vision in the objective form of its actual occurrence, as an event of the Past resuscitated by the narrative alone; on the contrary, it is made to appear as actually realized in the particular volition, morality or immorality of the specific characters depicted, which thereby become central in the principle of *lyric* poetry. Add to this, however, that such individuals are not merely disclosed in their inner experience as such; they also declare themselves in the execution of passion directed to ends; whereby they offer a criterion — in the way that epic poetry asserts what is substantive in its positive reality[8] for the evaluation of those passions and the aims which are directed to the objective conditions and rational laws of the concrete world; and it is, moreover, by this very test of the worth and conditions, under which such individuals continue in their resolve to abide, that their destiny is discovered by implication. This objective presence, which proceeds from the personality itself, no less than this personal experience,[9] which is reproduced in its active realization and all that declares its worth in the world, is Spirit in its own living totality; it is this which, as *action*, supplies both form and content to *dramatic poetry.*

Moreover, inasmuch as this concrete whole is itself no less essentially conscious life than it is, under the aspect of its external realization, also a self-manifestation, quite apart from all question of local or other artistic means of realization, we are bound, in respect to this representation of actual facts, to meet the claim of genuine poetry that we should have the *entire personality* of the individual envisaged; only as such the living man

himself is actually that which is expressed. For though, on the one hand, in the drama, as in lyric poetry, a character ought to express the content of its own soul-life as a veritable possession, yet, from another point of view, it asserts itself, when, in its entire personality it is confronted with other personalities, as effective in its practical existence, and comes thereby into active contact with the world around it, by means of which it attaches itself immediately to an active disposition,[10] which, quite as truly as articulate speech, is an expression of the soul-life, and requires its artistic treatment. Already we find in lyrical poetry some close approach to the apportionment of various emotions among different individual speakers, and the distribution of its subject-matter in acts or scenes.

In the drama, then, subjective emotion passes on likewise to the expression of action; and, by so doing, renders necessary the manifestation to our senses of the play of gesture which concentrates the universality of language in a closer relation with the expression of personality,[11] and by means of position, demeanour, gesticulation and other ways is individualized and completed. If, however, this aspect of deportment is carried forward by artistic means to a degree of expression, that it can dispense with speech, we have the art of pantomime, which resolves the rhythmical movement of poetry in a harmonious and picturesque motion of limbs, and in this, so to speak, plastic music of bodily position and movement gives animated life in the dance to the tranquil and cold figures of sculpture, that it may essentially unite by such means music and the plastic art.

[1] *Gleichgültige*, that is, the impressions of sense are received from without, from a manifold indifferent to ourselves.

[2] *Losheit.* A word coined by Hegel to denote this relation of poetry to external objects in their independence.

[3] *Die Gebehrden*, lit., gestures, in which sense it is used in a subsequent passage.

[4] We should rather have expected "the material of plastic art." The contrast is rather between the nature of the medium in each case than the finished product. So far as the latter is concerned the musical composition is as dependent, even more dependent for its presentment on human activity as poetical composition.

[5] *Des Klingens unseres Gewohnheit.* It is not quite clear what the meaning is here. The meaning may be as in the interpretation above. But it is rather difficult to see how, so far as mere print goes, we can be conscious of actual sound at all, unless it is intended here to include at least the act of reading; an alternative interpretation would be the "habitual verbal accent," but we should in that case have rather expected the substantive *Nachdrucks* for *Klingens.*

[6] Hegel means of course that as that notion stands midway between the objectivity of sense-perception and the concept of thought, so too this classification will be based on the attitude of the art either to the personal life, or the objects of sense, as the one aspect is more strongly represented or the other.

[7] *Dem Subject.* That is, I understand, the individual subject generally, not merely the conscious life of the poet or the singer.

[8] *In seiner Gediegenheit*, *i.e.,* as concrete.

[9] *Dies Subjektive.* The realization of self in the world is part of that world regarded as a rational and self-conscious process, Spirit.

[10] *Sich die Gebehrde anschliesst*, *i.e.* a practical attitude to the world, involving gesture and other actions.

[11] Hegel's expression is "the personality of expression," *i.e.,* the personal aspect of expression.

A. EPIC POETRY

The Epos, word, saga, states simply what the fact is which is translated into the word. It acquires an essentially self-consistent content in order to express the fact *that it is* and how it is. What we have here brought before consciousness is the object regarded as object in its relations and circumstances, in their full compass and development, the object, in short, in its determinate existence.

We propose to treat our subject-matter as follows:

First, we shall attempt to describe the *general* character of what is Epical:

Secondly, we shall proceed to some *particular* features, which in respect to the real Epos are of exceptional importance:

Thirdly, we shall enumerate by name certain *specific* methods of treatment, which have been actually in use in particular epic compositions within the historical elaboration of the type.

1. THE GENERAL CHARACTERISTICS OF THE EPIC TYPE

(*a*) The most simple, but nevertheless in its abstract concentration, still one-sided and incomplete mode of epic exposition consists in the assertion of that which is essentially fundamental and necessary among the facts of the concrete world and the wealth of mutable phenomena, and in the expression of such on their own account, as focussed in epic phraseology.

(*α*) We may begin our consideration of the type with the *epigram* i, in so far as it really remains an epigram, that is an inscription on columns, effects, monuments, gifts and so forth, and at the same time points with an ideal finger to something else, and by doing so explains through words, inscribed on an object, somewhat otherwise plastic, local, something

present outside the words expressed. In such an example the epigram states simply what a definite fact is. The individual does not as yet express his concrete self; he attaches a concise interpretation to the object, the locality, which he has immediate perception of and which claims his interested attention, an interpretation which goes to the heart of the fact in question.

(β) A yet further advance may be discovered in the case where the twofold aspect of the object in its external reality and the fact of inscription disappears, in so far, that is, as poetry, without any actual representation on the object, expresses its idea of the fact. To this class belong the gnomes of the ancients, ethical sayings, which concentrate in concise language that which is more forceable than material objects, more permanent and universal than the monument of some definite action, more perdurable than votive offerings, columns, and temples. Such are duties in human existence, the wisdom of life, the vision of that which constitutes in action and knowledge the firm foundations and stable bonds for human kind. The epic character of such modes of conception consists in this, that such maxims do not declare themselves as exclusively personal emotion and reflection, and also, in the matter of their impression, are quite as little directed with the object even of affecting our emotions, but rather with the purpose to emphasize what is of sterling validity, whether as the object of human obligation or the sense of honour and propriety. The ancient Greek elegiacs have in some measure this epic tone. We have still extant a few verses of Solon of this kind, though the transition here into a hortatory tone and style is easily made. Such include exhortations or warnings with reference to the common social life, its laws and morality. We may also mention the gold sayings, which tradition ascribes to Pythagoras. Yet all such are of a hybrid nature, and referable to this, that though in general we may associate with them the tone of our distinct type, yet, owing to the incompleteness of the

object, it is not fully realized, but rather there is a distinct tendency to involve with it that of another poetical type, in the present case the lyrical.

(*γ*) Such dicta may, however, *thirdly*, as already suggested, by being divested of this fragmentary and self-exclusive isolation, go to form a larger whole, be rounded off, that is, in a totality, which is altogether of the *Epic* type; we have here neither a purely lyrical frame of mind nor a dramatic action, but a specific and veritable sphere of the living world whose essential nature, as emphasized in its general characteristics, no less than as situated to particular aspects, points of view, occurrences or obligations, supplies us with an integrating unity and a genuine focal centre. In complete agreement with this type of epical content, which displays what is of permanent and universal import along with, as a rule, a distinct ethical purpose of admonishment, instruction or exhortation to an, in all essentials, ethically stable life, compositions of this kind receive a *didactic* flavour. Nevertheless, by reason of the novelty of their wise sayings, the freshness of their general outlook and the ingenuousness of their observation we must keep them quite distinct from more recent didactic poetry. They wholly justify, inasmuch as they give the necessary play to matter entirely descriptive, the conclusion that these two aspects taken together, instruction and description, are directly deduced as the substantive summary of facts which have been throughout experienced. As an obvious illustration I will merely mention the "Works and Days" of Hesiod, the teaching and descriptive power of which, in its primitive style and as a poetical composition, exercises a fascination upon us wholly different from the pleasure we experience in the colder elegance, the scientific or systematic conclusions of Virgil's poems on agriculture.

(*b*) The above described modes of epigram, gnome, and didactive poem accept their *specific* provinces of Nature or human life as their subject-matter, while endeavouring to fix attention in concise language, with more

or less limitation of survey, on that which is of permanent worth and essential truth in this or that object, condition, or activity; and even under the still more restricted condition which the art of poetry imposes on such a task the practical result upon human effort is still maintained. There is, however, a further or *second* type of such compositions, which is, on the one hand, profounder in its penetration, and, on the other, lays less stress on instruction and reform. Such are the cosmogonies and theogonies, no less than those most ancient works of philosophy, which are still unable entirely to liberate themselves from the poetical form.

(*α*) In this way the exposition of the Eleatic philosophy in the poems of Xenophanes and Parmenides still remains poetic in form; and this is exceptionally so in the introduction prefaced by the latter to his work. The content is here the One, which, in its contrast to the Becoming or the already Become, all particular phenomena in short, is eternal and imperishable. No particularity is permitted to bring content to the human spirit, which strives after truth, and, in the first instance, is cognizant of the same in its most abstract unity and concreteness. Expatiating in the greatness of this object, and wrestling with the might of the same, the impulse of soul inclines instinctively to the lyrical expression, although the entire explication of the truths into which the writer's thought here penetrates carries on its face a wholly practical and thereby epic character.

(*β*) It is, *secondly*, the *becoming* of objective things, in particular natural objects, the press and conflict of activities operative in Nature, which supplies the matter of the cosmogonies, and impels the poetic imagination to disclose in the still more concrete and opulent mode of actions and events real eventuality. And the way this faculty does this is by clothing the forces of Nature in relatively more or less personified or figurative images placed in distinct stages, and through the symbolical form of human events and actions. Such a type of epic content and exposition pre-eminently belongs to

Oriental Nature-religions; and above all among them the poetry of India is to an excessive degree prolific in the invention and portrayal of such modes of conception, frequently of an unbridled and extravagant type, concerning the origin of the world and the powers that are active therein.

(*γ*) We find, *thirdly*, similar characteristics in theogonies. Such occupy their true position mainly in so far as, on the one hand, the many particular gods are not suffered exclusively to possess the life of Nature as the more essential content of their power and creation, nor, conversely, is it one god that creates the world out of thought and spirit, and who, in the jealous mood of monotheism, will tolerate no other gods beside himself. This fair mean is alone exemplified in the religious outlook of the Greeks. It discovers an imperishable subject-matter for theogony-building in the forceful emancipation of the family of Zeus from the lawlessness of primitive natural forces, no less than in the conflict waged against them. It is a process and a strife which we may indeed affirm gives us the historical origins of the immortal gods of poetry itself. The famous example of such an epic mode of conception we possess in the theogony known to us under the name of Hesiod. In this composition the entire course of event is throughout wedded to the form of human occurrences; it becomes less and less symbolical just to the extent that the gods, who are summoned to a spiritual dominion, are themselves liberated through an intelligent and ethical individuality adequate to their essential nature, and consequently are rightfully claimed and depicted as acting like human beings. What is, however, still absent from this type of Epic composition is, in the first place, a genuinely complete *result*[1] as poetry. The acts and events, which are within the scope of the survey of such poems, are no doubt an essentially necessary succession of occurrence, but they are not an individual action which issues as from a centre, wherein it discovers its unity and independence. From a further point of view the content of such poetry does

not, and in virtue of its character cannot, present to us an essentially *complete whole*. It does, and for the above reason must, exclude the real activities of mankind, which are indispensable as the truly concrete material for the active display of the Divine forces. Epic poetry, therefore, is bound to free itself from such defects, if it is to receive its most perfect expression.

(*c*) This actually does take place in that sphere which we may designate the true *Epopœa.*

In the types hitherto discussed, which as a rule are wholly passed over, what we call the epic tone is unmistakably present, but the content is not as yet poetical in the concrete sense. Particular ethical maxims and philosophemata still persist as part of the material. What is, however, poetical in the full sense is concrete ideality in individual guise; and the epos, inasmuch as it makes what actually exists its object, accepts as such the happening of a definite action, which, in the full compass of its circumstances and relations must be brought with clarity to our vision as an event enriched by its further association with the organically complete world of a nation and an age. It follows from this that the collective world-outlook and objective presence of a national spirit, displayed as an actual event in the form of its self-manifestation, constitutes, and nothing short of this does so, the content and form of the true epic poem. As one aspect of such a totality we have the religious consciousness in every degree of profundity attained by the human spirit; it furthermore embraces the particular concrete life, whether political or domestic, not excluding all the detail of external existence, and the means by which human necessities are satisfied. All such material the epos makes of vital account as a growth in close contact with individuals; and for this reason, that for poetry the universal and substantive is only realized in the living presence of spirit life.

Such a comprehensive world, together with the human characterization it embraces, must then pass before us as real in a tranquil stream, without any undue haste, either as positive history or dramatic action, towards its aim and conclusion. We must thereby be permitted to linger round isolated facts, to penetrate into the different pictures of its movement and to enjoy them in all their detail. And by this means the entire panorama receives in its objective mode of realization the form of an external series of events, the basis and limitations of which must be implied in the essential ideality of the particular epic content, and of which the positive assertion is alone absent. If, consequently, the epic poem is, in its links of connection, more diffuse, and, by virtue of the relatively greater independence of portions of it, inclined to suffer from lack of coherency, we must not allow ourselves the impression that it could ever have been actually sung throughout in this manner. Rather it is an imperative in its case, as in that of any other artistic production, that it should be finished off in an essentially organic whole, which, however, moves forward in apparent tranquillity, in order that the particular fact and the images of actual life it contains may engage our interest.

(α) Such a primitive whole is the epic composition, whether known as the saga, the book, or the bible of a people. We may add every great and important nation can claim to have such primitive books, in which we find a mirror of the original spirit of a folk. To this extent these memorials are nothing less than the real foundations of the national consciousness; and it would be of profound interest to make a collection of such epic bibles. Such a series of Epopees, however much they fell short of artistic compositions in the modern sense, would at least present to us a gallery of the genius of nations. At the same time it is doubtless the fact that it is not every national bible which can claim the poetic form of the epopœa; nor do all nations which have embodied their most sacred memorials, whether in relation to

religion or secular life, in the form of comprehensive compositions of the epic type, possess religious books. The Old Testament, for example, contains no doubt much epic narrative and genuine history, no less than incidental poetic compositions; but despite of this the whole is not a work of art. In a similar way the New Testament, as also the Koran, are mainly limited to a religious subject-matter, starting from which the life of the world at large is to some extent and in later times a consequence. Conversely, though the Hellenes have a poetic bible in the poems of Homer, they are without ancient religious books in the sense the Hindoos and the Parsees possess such. Where, however, we meet with the primitive epopoea, we must essentially distinguish between primitive poetic books and the more recent classic compositions of a nation, which do not any longer offer us a mirror of the national spirit in all its compass but do no more than reflect it partially and in particular directions. The dramatic poetry of the Hindoos, for example, or the tragedies of Sophocles present no such exhaustive picture as we find in the Ramajana and the Maha-Bharata, or the Iliad and the Odyssey.

(*β*) And insomuch as in the genuine Epos the naïve national consciousness is expressed for the first time in poetic guise, the real epic poem will appear for the most part in that midway stage in which, though no doubt a people is aroused from its stupidity, and its life is to that extent essentially strengthened to the point of reproducing its own world and of feeling itself at home therein, yet, for all that, everything which at a later stage becomes fixed religious dogma or civic law and ethical rule, still remains in the fluency of life as mere opinion, inseparable from the individual as such. And along with this volition and feeling are not as yet held distinct from one another.

(*αα*) It is only after the separation of the individual's personal self from the concrete national whole, with its conditions, modes of opinion, exploits

and destiny; it is only, further, after the division in man himself between his emotion and volition, that the lyric and dramatic types of poetry in turn replace the epic type and attain their richest development. This consummation is only reached in the later life-experience of a people, in which the general lines laid down by men for the due regulation of their affairs are no longer inseparable from the sentiments and opinions of the nation as a whole, but already have secured an independent structure as a co-ordinated system of jurisprudence and law, as a prosaic disposition of positive facts, as a political constitution, as a body of ethical or other precepts; and being so, individuals are now confronted with material obligations rather as a necessary force external to themselves than one which their own inner life asserts, and which it compels them to substantiate as its fulfilment. As opposed to such an already actual and independent system, the individual life will seek in part to find expression in an equally independent world and growth of personal vision, reflection and emotion, which are not carried further into the sphere of action, and will further give *lyrical* utterance to its selfabsorption, its pre-occupation with the content of such a soul-experience. And, in part also, it will make its active passion of main importance, and will seek to assert itself independently in action, in so far as it is able to divest external conditions, the event and its concomitants of any claim to truly epic self-subsistency. It is just this increase to the strength and stability of individual character and aims in their relation to action which opens the way to *dramatic* poetry. To return, however, to the epic, we repeat that it is the above-mentioned unity of feeling and action which it demands, that unity between the self-fulfilled object of the personal life and the external accident and event; a unity which, as observed, is only present without blemish as it first appears in the earliest periods of the national life or the national poetry.

(*ββ*) At the same time, we must not yield ourselves, therefore, to the impression that a people in its heroical time simply as such, and as the home of its epos, there and then was in possession of art, or could necessarily depict its life in the mirror of poetry. As a matter of fact, an essentially poetical nationality in its actual world-presence is one thing; the art of poetry regarded as the imaginative consciousness of poetical material, and the artistic presentment of such a world is quite another. The felt want to express oneself *as idea* in terms of the latter, the trained knowledge of art, are later acquisitions than the life and spirit itself, which discovers itself in all simplicity at home in its unreservedly poetical existence. Homer and the poems under his name are centuries later than the Trojan war, which is to myself quite as much an historical fact as the personality of Homer. In the same way we may affirm of Ossian, always assuming that the poems ascribed to him are really his, that he celebrates an heroic past, the sunset splendour of which inspires him to recall and reclothe the same in poetical form.

(*γγ*) Despite, however, such a separation, some intimate bond of association must exist between the poet and his subject-matter. The poet must still stand on even terms with the conditions, the general point of vision, the beliefs which he depicts. All he should find it necessary to do is to attach to these the poetic consciousness and the art capable of portraying them; in other respects they are still essential factors in his own life. If such an affinity as that above described is absent in our poet's epic creation, his poem must infallibly contain disparate and irreconcilable features. For both these aspects — namely, the content, the epic world, which it is the intention to portray, and the world of the poet's conscious life and imagination, which is in other respects independent of the above — are of spiritual derivation; they each of them possess intrinsically a definite principle, in which particular traits of characterization are involved. If, then,

the personal life of the artist is essentially of a different order to that by virtue of which the historical and national life depicted came into actual being, we must necessarily become conscious of a cleft in the artistic result which will disturb and injure its effect. We shall have, in short, scenes placed before us of a previous condition of history, combined with modes of thought, opinions, and views more pertinent to other periods; and, in consequence of this, the configuration of primitive beliefs will, in its contact with the more developed reflection of a later time, lose the warmth of conviction, become, in short, a mere superstition, an empty embellishment of the mere poetical instrumentation, from which all the vitality of its actual life has vanished.

(*γ*) And this brings us to the general question what position the poet himself of genuine epic poetry really ought to take up.

(*αα*) Now, however much the Epos ought also to be positive in the sense that it is the objective presentment of a world based upon its own foundations, and realized in virtue of its own necessary laws, a world, moreover, with which the personal outlook of the poet must remain in a connection that enables him to identify himself wholly with it; yet it is equally true that his artistic product, which reproduces this world, is throughout the *free creation* of himself. In this connection we shall do well to recall that fine expression of Herodotus: “Homer and Hesiod have created the gods of the Hellenic race.” And, in truth, this free and audacious spirit of creation, which Herodotus attaches to the abovementioned poets, already is some testimony to the fact that although the Epopœa belongs to the early age of a nation, it is not its function to depict the most primitive condition of all. In other words, every nation possesses in its earliest origins more or less an alien culture of some kind, is confronted with a religious cult of foreign importation to which it submits, or which it regards as sacrosanct. And, indeed, we find that the minstrelsy, the superstition, the

barbarous elements in human life, no less than the most exalted have their source just in this, that instead of being entirely at home with themselves, they are experienced as something aloof from themselves, that is not the natural product of their own national and individual consciousness. In this way, for example, the Hindoos must certainly, long before the date of their great Epopees, have experienced many an important revolution of religious beliefs and secular condition. The Greeks no less, as previously remarked, had to transform much material of an Egyptian, Phrygian, and Asiatic descent. The Romans, in their turn, were confronted with much of a Greek origin; and the barbarians, in the period of national invasion, with Christian or Roman antecedents, and so on. Not until the poet is able with a free hand to cast from him such a yoke, is able to take stock of what he really possesses, is conscious of his own worth, and we are thereby released from all perturbed state of mental vision, will the dawn break of a genuine epic creation. In contrast to such an outlook we have the age and the society modified by a cult abstract in its origin, with its elaborate dogmas, established political and moral maxims, all of which take us away from the concrete life at home with itself. The world of the truly epic poet maintains its opposition to such conditions. Not merely in respect to universal forces, passions, and aims which are operative in the soul-life of individuals, but also in such a poet’s attitude to all external facts, be his creation never so independent, he is entirely as one in his own province. In just this way Homer is at home in all that he sings to us of his world, and where we are conscious of such intimacy in another we are infected with a like feeling, for we are here face to face with truth, with that spirit which lives in its world, and discovers therein its true being; and it does us good to feel this, inasmuch as the poet is himself present therein heart and soul. Such a world may, indeed, belong to a less advanced stage of evolution and culture than our own; but at least it does remain faithful to that of a poetry and beauty

which is open to all, so that we essentially recognize and understand here everything which our higher life, our humanity in its fundamental demands, whether it be the honour, the opinions, the emotions, the exhortation, or the exploits of each and every hero; and we are able to enjoy such characters, in all the detail of their portraiture, as themselves united to such a life and the richness of its actual presence.

(*ββ*) But on account of the emphasis upon the objective independence of this whole, it is a further necessary contrast that the poet fall into the background and become lost in his *subject*. What is to appear is the creation, not the poet; and yet withal, that which the poem expresses belongs to him. He has imagined all in his mind's eye; he has implanted there his soul, his genius. All this, however, is not expressly asserted. So we find, for instance, that at one time a Calchas will give the outline of events; at another, a Nestor. Yet, for all that, such interpretative matter is the gift of the poet himself. Nay, actual changes in the soul-life of his heroes he explains in objective fashion as an entrance of gods upon the scene, as in the case where Athene appears before Achilles in his rage, counselling self-restraint. And inasmuch as the Epos does not disclose the soul-life of the creator, save indirectly, but the positive facts of external life, the subjective aspect of his creations must completely fall into the background, no less than the creator himself vanish behind the world he unfolds to our vision. From this point of view a great epic style makes the work appear to be itself its own minstrel. It seems to pass before us self-begotten, a work of independent birth.

(*γγ*) Moreover, the epic poem, if a true work of art, is the exclusive creation of *one* artist. However much an epic may express the affairs of the entire nation, it remains the fact that it is the individual who is the poet, not the nation as a whole. The spirit of an age, of a people, is no doubt the essential operative cause; but realization is only secured in the work of art

as conceived by the constructive genius of a *particular* poet, who brings before our vision and reproduces this universal spirit and its content as his own experience and his own product. Poetical composition is a real spiritual birth, and spirit or intelligence only exist as this or that actual and individual conscious and self-conscious life. When we have already an artistic creation in a particular style,[2] we have no doubt something to start from; and others are then able to copy with more or less success something like it, just as we have to listen nowadays to some scores of poems written in the Goethesque manner. To continue to sing many compositions in the same kind of key, however, will never create the unified creation, which is throughout the work of *one* inspiring genius. This is a point of real importance not only in our attitude to the Homeric poems, but also the Niebelungen Lied. For the last-mentioned work we are unable to determine an author with any historical certainty; and as for the Iliad and Odyssey, the opinion of some critics is notorious that the Homer of tradition — that is, the sole author of these books — never existed at all. They are the production in different parts of various authors, parts which have finally been patched together in the two larger works we possess. With regard to such a theory the question of most importance is whether either or both of these extant works constitute an independent organic whole in the epic sense, or, as is the view fashionable nowadays, they possess no inevitable beginning or conclusion, but rather might be continued on present lines for ever. We may, of course, admit that the unity of the Homeric poems is, as part of their essential form, less compact than that we associate with the terse concentration of a dramatic work. Inasmuch as every separate portion may be and may appear as relatively independent, they give free play to many interpolations and abrupt transitions; but, despite of this, they do unquestionably constitute throughout a true, ideally organic, and epic totality. Such a whole can only be the composition of *one* author. This notion of a conglomerate without

essential unity, of a mere patching together of various rhapsodies composed in a similar strain, is a wild sort of idea opposed to all artistic canons. Of course, if such a view merely amounts to this, that the poet, in his bare individuality, vanishes in his creation, it is the highest form of praise. This is merely a statement that we are unable to recognize any positive traces of wholly personal opinions and feeling. So much is certainly true of the Homeric poems. What we have before us, and we have only this, is the positive fact, the objective outlook of a people. But the song of a people requires a voice, a voice which can sing forth the contents of heart and soul, as harvested from the national granary; and an essentially self-integrated work of art calls for yet more than this from the *unique* genius of its creator.

2. PARTICULAR CHARACTERISTICS OF THE GENUINE EPOS

We have previously in our consideration of the general character of epic poetry briefly drawn attention to certain incomplete types, which, although of an epical strain, are not epopees in their completeness. They, in short, neither represent a national condition, nor a concrete event, within the boundaries of such a sphere. It is these latter features, which were then excluded, which offer us for the first time a content wholly equal to the perfected Epos, whose fundamental traits and conditions are thus stated.

Having recalled these points it becomes necessary now to investigate more closely what it is we require by way of completing our notion of the epic work of art. We are, however, on the threshold of this enquiry confronted with the difficulty that we have little or nothing to say on features of specific interest, if we confine our attention to generalities; Ave must rivet our attention on historical evidence, and those varied epic and national compositions, works which on account of the extraordinary diversity of the times and peoples to which they refer do not make us very hopeful of securing either a definite or a congruous result. We find,

however, some compensation in the fact, that from among all the many epic bibles of the past we can place our finger on one at least, in which we have the clearest evidence of all which it is possible to establish as the true and fundamental character of the genuine epos. Such are the Homeric poems. These, then, above all, will be the source from which I shall borrow the characteristics, which, in my view, essentially determine the nature of such poetry, whether from the point of view of fact or theory. We propose to summarize our enquiry under the following heads:

First, we have to deal with the question, of what structure *the general* world condition ought to be, on the basis of which the epic event is permitted to receive an adequate reproduction.

Secondly, we shall investigate the quality of this specific type of historical event itself.

Lastly, we shall direct attention to the form in which these two aspects of our subject-matter coalesce and are completed in the unity of a single work of art, that is, in the epic poem.

(*a*) *The General World-condition of the Epic Poem*

We have already, when Ave started on this subject, seen that it is not a single isolated action which is accomplished in the true epic event; the subject of the narrative is not, in short, a wholly accidental occurrence, but an action which is dove-tailed into the entire complexus of a particular age and national circumstances, which in consequence can only be placed before us with success as a constituent part of an extensive world, demanding as it does the reflection of such a world in its entirety. In respect to the actual poetical content of this background I shall be brief, inasmuch as I have already indicated the fundamental points of interest when, in the first part of this work, I discussed the general world-condition which the ideal action presupposed. In the present context therefore I shall restrict myself to the question what is of most importance to the Epos simply.

(*α*) That which is most adapted, as the all-embracing condition of human society, to form the background of the Epos consists in this, that it already possesses for particular individuals the form of a positive condition actually present, and yet continues with them in closest association with the simplicity of primitive life. For if the heroes who are placed as the crowning fact of all, are first to found a collective condition the determination of what is or ought to come into existence falls into the more personal sphere of character to a greater extent than is compatible with the nature of the Epos, and therewith all appearance of the same as objective reality is impossible.

(*αα*) The relations of ethical life, the aggregate of the family, of the people regarded as a complete nation, not merely with a view to war, but also in their peaceful security, must have become a positive fact in their evolution; yet along with this their organization cannot as yet have assumed the settled form of co-ordinate regulations, obligations, and laws independent in their validity of the direct personal and private activities of individuals, and possessive of the power to maintain themselves against such particular wills. Rather it is the *intuitive sense* of right and fairness, the moral habit, the temperament, the personality, which supply the support, as they are the source, of such a social order; we have, in short, no theoretic intelligence in its precipitated form of prosaic reality able to establish and secure such a resistance to the heart, the opinions and passions of individuals. We may dismiss the thought that a community with a fully organized constitution and an elaborate system of law, judicial courts, government officials and police, would supply the environment of a really epic action.[3] The conditions of positive morality must, no doubt, be present in the general will and conduct, but the instruments of its realization can only be the action and personality of individuals, and a determinate mode of its existence, of universal application and independent stability, is necessarily absent. We find, in short, in the Epos no doubt the substantive

reciprocity of objective life and action, but we find no less a freedom in this world of life and action, which has all the appearance of originating exclusively from the isolated volition of individuals.

(*ββ*) The same considerations apply to the relation of the individual to the *natural* environment, from which he borrows the means to *satisfy* his wants, no less than discovers the best way to do so. In this respect, too, I would refer the reader back to what I have observed at greater length, when discussing the external definition of the Ideal.

What mankind requires in its external life, house and farm, tent, settle, bed, sword, lance, the ship, in which he crosses the sea, the chariot, which bears him into battle, his soup, his roast of meat, and drink — not one of these things need perforce become to him a lifeless instrument; he ought still to communicate to the same something of his entire life and substance, his essential self, and thereby leave the stamp of his own human individuality, by his active association on that which is otherwise wholly external. Our present life with its machinery and factory-made products, no less than the kind of way we seek to satisfy generally the needs of our external life, is in this respect quite as much as that of our political organization, wholly unfit to form the background which the Epos in its primitive guise demands. For just as the scientific faculty with its generalizations, its imperious conclusions, delivered independently of all personal views, can never have asserted its claim under the world-condition of the poetic type we are considering, so, too, we may assume that man did not yet appear divested of his vital connection with Nature, and the fresh and vigorous comradeship, whether as friends or opponents, which is therein implied.

(*γγ*) Such is the world-condition which, in a previous passage, and in contrast to the idyllic, I have called the *heroic.* We find it depicted in Homer with the noblest poetry, and with all the wealth of entirely human

characterization. We have no more here, whether in domestic or public life, a barbarous state of things, than we have the wholly conventional prose of a regulated family and political organization; what we do find is that primitive mean of poetry much as I have already described it. A fundamental feature in such a condition is unquestionably the free individuality of all the principal personages. In the Iliad, for example, Agamemnon is, no doubt, a king of kings — all other chieftains are subject to his sceptre — but his superiority is no merely formal mutual relation of command and submission of the lord, that is, to his vassals. On the contrary, much circumspection is required of him; he must be shrewd enough to know where he ought to give way, for each particular chieftain is independent even as himself; they are not merely governors or generals summoned by him. They have assembled around him of their own free will, or are induced to follow his lead in a variety of ways. He must take counsel with them; and if they disagree with his judgment they are at liberty, as Achilles did, to remain aloof from the battle. It is this freedom of acceptance, no less than this free right to assert disapproval, which secures the absolute independence of such individuality, and attaches its poetical atmosphere to every situation. We find much the same thing in the poetry of Ossian, as also in the relation of the Cid to the princes, whom this poetical hero of romantic and national chivalry serves as vassal. In Ariosto and Tasso this free relation is still unimpaired; and indeed in Ariosto the individual heroes set forth in practically unqualified independence on their own path of adventure. And the mass of the folk stand in much the same relation to their leaders as that of the separate chieftains to Agamemnon. These too follow voluntarily. There is still no paramount legal obligation by which they are constrained. Honour, reverence, humility in the presence of men more mighty than themselves, ever able to enforce that might, the imposing presence of the heroic character in short and all it implies, such

are the essential grounds of their obedience. The order of domestic life is maintained in a similar way. It is not enforced as an accepted rule of service, but as dependent on personal inclination or ethical habit. All is made to appear as though it had grown up spontaneously. Homer, for example, tells us of the Greeks, when narrating one of their battles with the Trojans, that they had lost many valiant fighters, but not so many as the Trojans; and the reason given is that they were always mindful to ward off from one another the extreme of necessity. In other words, they assisted each other. And if we, in our own days, had occasion to define the difference between a well-disciplined and an uncivilized army we could not express it more directly than by laying stress on this very coherence and spirit of cameraderie, this unity enforced by all in a felt association, which distinguished the former. Barbarians are simply human mobs, in which no individual can rely on his neighbour. What, however, in our modern example, being as it is the final result of a stringent and tedious military discipline, rather appears as the exercise and command of an established regime, in Homer's case is still an ethical habit asserted of its own accord, springing from the vital strength of the individual in his private capacity.

We may explain in a similar way Homer's great variety in his descriptions of Nature and external condition. In the prose romances of our own day we do not find much stress laid on the natural aspects of things. Homer, on the contrary, gives us every detail in his portrayal of a staff, sceptre, bedstead, armour, clothing, doorpost; he does not even omit to mention the hinges on which the door turns. Such things appear to us wholly outside our attention and insignificant; or rather we may say that it is the tendency of our education to affect an extremely severe superiority to a whole number of objects, matters, and expressions, and we deliberately classify in their claim to our notice such things as various kinds of dress, furniture, implements, and so on. Add to this the fact that in our day all the

means supplied or prepared for the satisfaction of our wants are so split up into every kind of machinery product from work-shop and factory, we come to regard the medley of supply as something beneath us, neither deserving enumeration or respectful attention. The heroic existence is, on the contrary, confronted with a primitive simplicity of objects and inventions; it readily lingers on their description. All these possessions are, in short, regarded as of one standard of value, as chattels or instruments in which man still discovers evidence of his craftsmanship, his positive wealth and interest whereof he may be justly proud. His entire life is not abstracted from such material things, nor exclusively occupied with a purely intellectual sphere. To slaughter oxen and prepare their flesh for the table, to pour out wine and things of that sort are part of the heroic life, carried out with purpose and delight; with us a meal, if it is not to be a very commonplace affair, must not merely carry with it something of the culinary art, but is incomplete without really good conversation. Homer's detailed descriptions in these matters must not therefore be looked upon as a purely poetical embellishment of things of little moment; such a copious attention is nothing more or less than the actual spirit of the men and circumstances depicted. We find just the same prolixity of speech on external things in the case of our own peasants; and for that matter do not the dandies of our own day dilate without limit upon their stables, horses, top-boots, spurs, pants, and the like. In contrast to a life of profounder intellectual interest such things will doubtless appear somewhat jejune.

Such a world ought not merely to embrace the *limited* universality of the particular event, which occurs on the *definite* background presupposed; it must coalesce in its expansion with the *entire horizon* of the national vision. We have a supremely fine example of this in the Odyssey, which not only brings us into contact with the domestic life of the Greek chieftains, their servants and subordinates, but also unfolds the richest variety with its tales

of the many opinions of foreign peoples, the hazards of sea-life, the dwellings of distant lands, and so forth. But in the Iliad also, though the nature of its subject restricts to some extent the horizon of our vision, and not unnaturally on its battle-fields has comparatively little to tell us of more tranquil scenes, Homer, at least, has on the shield of Achilles managed in a wonderful way to give us a view of the entire compass of terrestrial existence, no less than human life, in marriages, judicial affairs, agriculture, the might of armies, the private wars of cities, and much else. And these descriptions we ‘shall do well not to regard as a wholly incidental feature of the poem. In contrast to such a treatment the poems we identify with the name of Ossian introduce us to a world that is too limited and indefinite. It has for this very reason rather a lyrical character; and as for Dante we may say that his angels and devils inhabit no truly positive world open to our detailed approach; it exists solely as instrumental to the final fruition or due punishment of mankind. And above all in the Nibelungenlied the absence is complete of any definite realization of a visible world or environment, so that the narrative tends in this respect to assume the strain or tone of the mere balladsinger. The narrative is, no doubt, diffusive enough; but it is all much as if some journeyman had picked it up first as gossip, and then retailed it as such afterwards. We are not brought to close quarters with the facts, but are merely made aware of the impotence and tedious effort of the poet. This wearisome expanse of poetical debility becomes of course even more pronounced in the Book of Heroes, until finally the whole business is handed over to the true poetical journeyman, in other words, the Master singers.

(*β*) Furthermore, for the reason that the Epos has to embody in art a specific world, in all its separate characteristics carefully defined, one, in short, for this reason itself essentially individual, the mirror of such a world must be that of a one *particular* people.

(*αα*) In this respect all truly primitive Epopees present to our view a national spirit in the ethical structure of its family life, its public dispositions in times of peace or war, its wants, arts, usages, and interests — in a word, a picture of the relative type and stage of the national consciousness. What the epic poem reveres more than anything else, observes most narrowly, that which, as previously noted, it expatiates upon, is the power to let our inward eye see as in a mirror the individual genius of nations. We have presented us, as the result of such a gallery, the world-history itself, and what is more, we have it in its beautiful, free, and emphasized vitality, manifestation, and deed. From no source, either so impregnate with life or simplicity, can we, for example, better understand the Hellenic spirit and Greek history, or at least grasp the principle of that content, which this people embodied, and which it brought with it when it first set forth to engage in the conflict of its wholly authentic history, than from this of the poet Homer.

(*ββ*) Now the national substance in its realization is of a *twofold* nature. First, we have an entirely *positive* world of specialized usage or custom peculiar to the nation in question, a definite period of history, a definite environment, whether geographical in its streams, hills and forests, or in its climatic situation. Secondly, we have that ideal *substance* of its spiritual life, whether in the religious sphere, the family or the community generally. If thus an Epos of the primitive type is, under the conditions already indicated, to be and remain a permanently effective bible, the nation's Book, in that case that which is positive in the reality of the Past can only claim such a continuously vital interest in so far as the characteristic features accepted are placed in an ideal connection with the actually substantive aspects and tendencies of the national life. Otherwise what claims to be of positive value will be entirely contingent and a matter of

indifference. Native geographical conditions, for instance, enter into the conception of nationality. But if they do not confer on a folk its specific character, the addition of other natural environment, provided that does not contradict national character, is not in certain cases prejudicial to the effect, but may even prove attractive to the imagination. No doubt the sensitive experience of youth is interwoven with the immediate presence of its native hills and streams; but where the deeper bonds of the entire spiritual outlook are absent, such an association assumes a more or less external character. And, apart from this, where we have, as in the Iliad, a warlike expedition, it is impossible to preserve the *locale* of the fatherland. In such a case the scenery of a foreign land in itself fascinates and attracts. The enduring vitality of an Epos is, however, more seriously impaired, where, in the course of centuries, the spiritual consciousness and life has so entirely changed that the links between the more recent Past and the original point of departure already adverted to are completely severed. This is actually the case with the poet Klopstock in another province of poetry, where he attempts to establish a national religion, and, in order to do so, gives us his Hermann and Thusnelda. We may affirm the same kind of defect of the Nibelungenlied. The Burgundians, the revenge of Chriemhilda, the exploits of Siegfried, the entire social condition, the fated downfall of an entire race and many like facts — all this is no longer vitally held together with the domestic, civil, and judicial life, the institutions and constitutions of the present day. The biography of Jesus Christ, with its Jerusalem, Bethlehem, and Roman jurisdiction, even the Trojan war itself, come home to ourselves far more nearly than the events of the Niebelungen; the latter are for present consciousness a state of things wholly gone for ever, swept away once and for all with a besom. To attempt to compose of such something of national significance, to say nothing of a national bible, betokens the extreme limit of folly and superficiality. In times when it was rashly[4] assumed that the

flame of youthful enthusiasm had flashed up anew, such a conceit was taken as a proof of the sere leaf of an age once more become childlike in the approach of death; and it refreshed itself with a past that was dead, and deemed it possible to associate others with a similar refreshment and renewed presence.

(*γγ*) If, however, a national Epos is to secure in addition the permanent interest of foreign nations the world which it depicts must not merely be of a *particular* nationality, but of a type that is, in this specific folk, its heroism and exploits, equally impressed with the stamp of our common humanity. In the poems of Homer, for example, the superb directness with which he deals with matters of divine or ethical import, the nobility of the characters and of everything living therein embraced, the pictorial quality of their presentment to the reader, all this insures an undying truth for succeeding ages. In this respect we find a remarkable contrast in the creation of different peoples. We cannot deny, for instance, that the Ramajana reflects with the essential directness of life the national spirit of the Hindoos, more particularly from the religious point of view; but the character of the entire Hindoo race is so overpoweringly of a unique type, that the essential features of our common humanity are unable to assert themselves through the veil of this national idiosyncracy. A remarkable contrast to this is the way in which the entire Christian world, from the earliest times, has found itself at home in those epic passages of Old Testament narrative, above all in the pictures of the patriarchal state, and able to repicture for itself to the life the events portrayed over and over again with the greatest enjoyment. The testimony of Goethe is unequivocal. Here was the *one* focal centre, he assures us, on which, in his young days, amid much that he learned of a miscellaneous and unconnected character, his intellect no less than feeling concentrated itself. Even in later life he still remarks upon them that "after all our wanderings through the East we always returned in the end to these

writings as the most invigorating spring of waters: here and there they might be troubled; not unfrequently they hid themselves in the earth; but it was only to rise up again pure and fresh as ever."

(*γ*) *Finally*, the general condition of a particular people must not in this tranquil universality of its individual character wholly oust what is more directly the object of the Epos, in other words, be described with no reference to that. It ought only to appear as the *foundation*, upon which an event throughout its entire process is transacted, one which is in contact with all aspects of the national life, and one which illustrates the same as it proceeds. Such an eventuality must not be a purely external incident; it must imply a deliberately conceived purpose executed by equally deliberate effort. If, however, these two aspects, namely, the general condition and the particular action, do not coalesce, then the event in question must seek its justification in the particular circumstances, the causal conditions which dominate its movement. That is practically to say the world of Epos which is reproduced must be conceived under a specific situation which is so concrete that the definite objects which it is the function of the epic narrative to realize, are necessarily made explicit by it. We have already, when discussing the ideal action,[5] pointed out on general lines that this realization presupposes situations and circumstances which bring about collisions, actions that do injury and consequently necessary reactions. The particular situation, therefore, in which the epic world-condition of a nation is made actual to us, must of itself be essentially one implying such *collisions*. In this respect, therefore, epic poetry enters the field already occupied by dramatic poetry; and we may find it convenient at once to determine in what respects the collisions of these two types of poetry differ.

(*αα*) Under the broadest review of this question we may say that the conflict of the *belligerent* condition is that which supplies the Epos with its most pertinent situation. In war it is obviously the entire nation which is set

in activity, and which, as a whole placed under similar conditions, is moved and stimulated in a novel way, in so far at least as it possesses any claim, as such a whole, to participate in it. We may admit that the above conclusion stands in apparent contradiction not merely with Homer's Odyssey, but also the subject-matter of many poems that are epic in an otherwise intelligible sense. It finds, however, ample corroboration in the majority of the most famous Epopees. Moreover, the collision of operations in the events of which the Odyssey informs us, derives part of its source from the Trojan war; and even under the aspect of domestic life in Ithaca, no less than that of the home-returning Odysseus, although the narrative is no actual account of conflicts between Greeks and Trojans, yet it deals with facts which are the immediate consequence of that war. Nay, it is itself war under a new aspect, for many chieftains are forced to reconquer their homes, which after their ten years' absence they find under wholly altered conditions. We have practically but one example of the religious Epos, Dante's "Divine Comedy." Even here, too, the fundamental collision is deducible from that original Fall of the evil angels from heaven, which brings in its train and within the sphere of human experience the ever active external and ideal conflict between the Divine Father and the conduct of men, whether hostile or well-pleasing to Him, a conflict eternally perpetuated in condemnation, purification, and blessedness, or in other words, hell, purgatory, and paradise. Also, too, in the Messias it is the former war against the Son of God which supplies the focal centre. At the same time the most vital and truly pertinent examples are those which actually describe the belligerent state. We have already drawn attention to such in the Ramajana, and, most instructive of all, in the Iliad; further examples are the famous poems of Ossian, Tasso, Ariosto, and Camoens. In war *courage* is and remains the fundamental interest; and warlike courage is a state of the soul and an activity, which is neither so suitable for lyrical expression nor for dramatic

action, but is pre-eminently adapted to the descriptive power of the Epos. In dramatic poetry it is rather the ideal strength or weakness of spiritual life, the ethically justified or reprehensible pathos which is the main thing: in the Epos, on the contrary, it is rather the native characteristics of a personality. For this reason, where it is national exploits which are undertaken, bravery is in its right place; it is in fact not an ethical state,[6] in which the will is determined through its own initiative as an intelligent consciousness and volition. It rather depends on natural temperament, unites in direct equilibrium, as by fusion, with the sphere of self-conscious life, and, in order to bring into effect practical ends, which can be more fitly expressed in epic description than under the conceptions of lyrical emotion and reflection. And these conclusions with regard to bravery in war apply with equal force to the exploits of war and their consequences. The activities of personal volition and the accidents of the external event supply the two scales of the balance. The bare event, with its wholly material obstructions, is excluded from the drama, inasmuch as here what is exclusively external is not permitted to retain an independent right, but is causally related to the aim and ideal purposes of individuals, so that as to all contingent matter, if by any chance it appears to arise and to determine the result, we are none the less compelled to look for the real operative cause and justification thereof in the spiritual nature of human character and its objects, no less than in that of its collisions and their necessary resolution.

(*ββ*) A basis of the epic action such as this of active hostilities is obviously the source of a very varied subject-matter. We may have placed before the imagination a host of interesting actions and events, in which bravery in action supplies the leading rôle, and the claim of external forces, whether asserted in circumstance or incident, is maintained unimpaired. At the same time we must not overlook a respect in which the possibilities of epic narration is essentially restricted. It is only wars waged between one

foreign nation and another which partake of a truly epic character. In contrast to this conflicts between dynasties, civil wars and social revolution, are more suited to dramatic exposition. And in fact Aristotle long ago[7] advises the tragic poet to select subject-matter which is concerned with the conflicts of brother against brother. Of this type is the war of the Seven against Thebes. It is Thebes' own son who storms the city; and its defender is the actual brother of the aggressor. Hostility of this type is something more than that of a mere foe; its significance is bound up with the individuality of the opposed brothers. We have similar examples with every kind of variety in Shakespeare's historical tragedies. In these, almost without exception, agreement between particular individuals is what might be legitimately looked for, and it is only the private motives of individual passion and a personality absorbed in its own aims and satisfaction which bring about collisions and wars. As an example of an action of this kind treated in the epic manner, and therefore defectively, I will mention the "Pharsalia" of Lucan. However indisputably important the conflicting aims in this poem may appear to be, yet for all that the opposing parties are here too closely related on the common ground of one fatherland: their conflict, consequently, instead of being a war between two national entities, is nothing more than a strife of parties, either of which, by the very fact that it splits asunder the substantive national unity, points in one direction, namely, that of tragic guilt and demoralization. Held to this the objective facts are not placed before us in their clearness and simplicity, but are inweaved with one another in a confused manner. The same objections are equally pertinent to Voltaire's Henriad. In contrast to this the hostility of *foreign* nations is something substantive. Every nation constitutes a totality essentially distinct from and in opposition to that of another. When these come into conflict we do not feel that any positive ethical connection is shattered, nothing at least of essential value to either is violated,[8] no

necessary whole broken into fragments. Rather it is a conflict waged in order to maintain such a totality unimpaired and to justify its claim to be so. Hostility therefore of this type is suited in every way to the essential character of epic poetry.

(*γγ*) Not every war, however, waged under ordinary conditions between two hostile nations is necessarily on that account of an epic character. We must have a further condition satisfied, namely, the justification on broad historical grounds for the bellicose attitude thus adopted. Only when we have this do we obtain a picture of an enterprise at once novel and more exalted, which does not present the appearance of something apart from universal history, the purely capricious subjugation of one state by another, but is absolutely and essentially rooted in a profounder principle of necessity, however much at the same time the more superficial and obvious motive of the undertaking may assume from one point of view the aspect of deliberate wrong,[9] and from the other that of a private revenge. We have something analogous to such a situation in the Ramajana. But the supreme example is that of the Iliad, where the Greeks invade an Asiatic people, and in doing so fight out as it were the preludic conflict of a tremendous opposition, the wars of which practically constitute the turning point of Greek history as we see it on the stage of universal history. Of the same type is the struggle of the Cid against the Moors, or in Tasso and Ariosto the battles of the Christians against the Saracens, or in Camoens the strife of the Portuguese against the Indians. And indeed we may assert that in all the greatest Epopees we find nations which differ from each other in moral customs, religion, and language, in a word, in all that concerns their spiritual and external life, brought into collision; and we are ready to contemplate such without any revulsion on account of the triumph we find asserted there of a nobler principle of world-evolution over a less exalted, a victory assured by a bravery that is simply annihilating. If any one should,

in this sense, and in emulation of past Epopees, which have sought to depict the triumph of the West over the East, of the European principle of moderation, of the individually articulate and truly organic type of beauty over Asiatic splendour, over the magnificence of a patriarchal unity, which does not attempt to secure such organic completeness, or is at least merely held together by abstract and superficial conjunctions, if such, I say, should aspire to write the Epopee of the future, he will be necessarily restricted to the portrayal of the victory of some future and intensely vital rationality of the American nation over the prison-house of the spirit which for ever pursues its monotonous task of self-adjustment and particularization.[10] In the Europe of our day every nation finds itself conditioned[11] by its neighbour, and cannot venture on its own account to wage any war with another European nation. If we lift our eyes beyond Europe, there can be only one direction, America.

(*b*) *The Individual Epic Action*

It is on such an essentially limited foundation then of conflict between entire nationalities that the epic event is realized, the leading characteristics of which we have now to determine. We may summarize the form we propose our investigation should take as follows:

Firsts what actually takes place consists essentially in this that the object of the epic action ought necessarily to be of *individual vitality* and definition, however much it may rest on a basis of the most general extension.

Secondly, for the reason that it is only of individuals that we can predicate actions we have the problem to solve of the general nature of the epic *character* or personality.

Thirdly, in the epic eventuality the form of objectivity is not exclusively that of external appearance: it consists quite as much in the significance of all that is itself intrinsically necessary to and substantive in the exposition.

We have consequently to determine the form in which this intrinsic significance of the occurrence proclaims itself as effective, either in part as the ideal necessity which is therein concealed, or as the disclosed direction[12] of eternal and providential forces.

(*α*) We have postulated as a necessary background of this epic world an enterprise of national significance, in which the entire compass of a national spirit can express itself in the bloom and freshness of its heroic condition. From this fundamental substratum in its simplicity we now further assume the apparition of a *particular* end, in the realization of which all other aspects of the national character, whether in belief or action, can be represented to our vision. The original postulate is in fact bound up in the closest way with such an all-embracing actuality.

(*αα*) This purposed object, which is infused with the vital principle of individuality on the lines of which, regarded in its particularized content, the entire process moves forward, must further, as already ascertained, appropriate to itself in the Epos the form of an *event*. It will be therefore above all important to recall at once the specific character of the mode, under which human volition and action generally combine in what we designate as the event. Now, in the *first* place, action and adventure are the outcome of conscious life, the content of which is not only ideally expressed in emotions, reflections, and thoughts, but also quite as much in a practical way. We may regard such realization from two distinct points of view. *First,* we have the ideal substance of the end presupposed and purposed, the general character of which the individual must recognize, will, calculate and accept. *Secondly*, there is the external reality of the spiritual or human and the natural environment, within which he is only able to act, and the accidental features of which at one time obstruct and at another assist his path; so that either in the one case he is carried forward by virtue of this favour to a successful issue, or, if in the other he is not

prepared wholly to give way to such opposition, he finds it necessary to overcome them with his individual energy. If now the world covered by this volitional power is conceived as the indivisible unity of these two aspects, with the result that the right of assertion by both is equally asserted, in that case what is most pertinent to conscious life likewise enters into the formal structure of the event, the form, that is, which confers on all human action the *configuration of events*, in so far as the conscious or subjective will, with its purposes, motives of passion, principles and aims, can no longer appear the fact of most importance. Or, in other words, in human *action* everything is referred back to human personality, personal obligation, opinion and intention. In the case of the *event*, on the contrary, the external constitution of things is permitted to assert its inviolable claim. Here it is objective reality itself, which constitutes either the form assumed by the whole, or from another point of view a fundamental part of the content. In agreement with such a view I have already stated that it is the function of epic poetry to demonstrate the *happening* of an action, and thereby not only to establish the external disposition of the execution of ends, but also to meet as readily the claims of external condition, natural occurrences, and all else of a contingent character, which, in action taken simply as such, the ideal element of conscious life claims exclusively as its province.

(*ββ*) With regard to the *particular* end, the carrying out of which the Epos unfolds under the mode of the event, it follows from our previous conclusions that it must be no mere mental *abstraction*, but on the contrary of wholly *concrete* definition. At the same time, inasmuch as it is realized within the substantive actuality of the national unity, such a process must exclude the notion of merely capricious activity. The political state as such — the fatherland, let us say — or the history of a State and country, are essentially something universal, which, regarded in the light of such universality, does not appear under the mode of a subjectively individual

existence, or, in other words, in inseparable and exclusive coalition with one definite living individual. For this reason the history of a country, the development of its political life, its constitution and destiny may also no doubt be narrated as event; if, however, the facts thus described are not placed before us as the concrete deed, the conscious aim, the passion, the suffering and accomplishment of particular heroes, whose individuality supplies the form and content of the realization in all its parts, the event merely assumes the rigid form of its independent forward movement in the prosaic history of a people or an empire. In this respect no doubt the most exalted action of Spirit would be the history of the world itself. We can conceive it possible that our poet might in this sense undertake to elaborate in what we may call the absolute Epos this universal achievement on the battlefield of the universal spirit, whose hero would be the spirit of man, the *humanus*, who is drawn up and exalted from the clouded levels[13] of conscious existence into the clearer region of universal history. But in virtue of the very fact of its universality a subject-matter of this kind would so be quite unfitted for artistic treatment. It would not adapt itself sufficiently to individualization. For on the one hand we fail altogether to find in such a subject a clearly fixed background and world-condition, not merely in relation to external *locale*, but also in that of morality and custom. In other words, the only basis for all we could possibly presuppose would be the universal World-Spirit or intelligence, whom we are unable to bring visibly before us as a particular condition, and who is possessed of the entire Earth as his local environment. And in like manner too the one end fulfilled in such an Epos could only be the end proposed by the World-Spirit himself,[14] who can only be apprehended and explicitly disclosed in his true significance through the processes of thought. If he is, however, to be represented in the form of poetry, or, at least, if the whole is to receive its proper meaning and coalescence from such a source, it is necessary that his

presence should be expressed as that which acts independently from its own resources. This could only be possible for poetry, in so far as the ideal Taskmaster of history, the eternal and absolute Idea, which is realized in humanity, either was envisioned as a directive, active, perfecting individual person, or was merely made effective under the concealing veil of an ever-operative Necessity. In the first case, however, the infinity of such a content must shatter the necessarily limited artistic vessel of determinate individuality, or, as the only way of avoiding such a defect, must assume the inadequate form of a dispassionate allegory of general reflections over the destination of the human race and its education, over the final purpose of mankind, its moral consummation, or over whatever result the end of this World-history might establish. In the alternative case it is the genius of the various peoples which has in each example to be presented (in the heroic figure) in the conflicting existence of whom history expands and moves forward in progressive evolution. If, however, the genius of nations is really to appear in poetical form this can be carried out in only one way, namely, by placing before us the actual world-historical figures as operative through their deeds. We should, however, then merely have a series of particular characters, which emerged and again disappeared in a wholly external succession, the objects of which lacked individual unity and connection; and this would be so for the reason that the controlling World-Spirit, under our conception of it, as the ideal essence and destiny, could not, in the case supposed, be set forth as itself an active individual and the culminating agent in the process. And if, further, anyone was desirous of appropriating the spirits of different nationalities in their universality, and of displaying them as agents in such a substantive form, we should still only have a similar series, the individuals whereof, apart from the fact that they would merely possess an appearance of positive existence similar to Hindoo incarnations, would, in the fictitious form of the imagination they received

pale into nothingness when contrasted with the truth of the World-Spirit as realized in actual history.

(*γγ*) We may consequently lay it down as a general principle that the particular epic event is only able to secure a vital form in poetry when it is united in the closest state of fusion with *one* individual. Precisely as it is *one* poet who thinks out and executes the whole, so too *one* individual must crown the edifice, with whom the event is associated and in connection with whose single identity it is continued and completed.

We must point out, however, that here too we are limited by essential conditions. For just as in our previous discussion it was the world-history, so too now, from the converse point of view, it is possible that the biographical treatment in a poetic composition of a definite life-history may appear to supply the most complete and adequate subject-matter of the Epos. This, however, is not the case. No doubt in biography the individual is one and the same throughout; but the events, through which the life-development proceeds, may entirely fall apart, and only retain the subject of the same in a wholly formal and accidental bond of relation. If, on the other hand, the Epos is essentially homogeneous, the event also, in the form of which the content of the poem is disclosed, must itself possess intrinsic unity. Both aspects, in short, the unity of the individual and that of the objective event, as it is evolved, must coalesce and be united. In the life and exploits of the Cid it is unquestionably true that on the field of the Fatherland it is only one great personality which without intermission remains true to himself, and in his development, chivalry and end constitutes the interest. His deeds pass before him, much as if he were the sculptured god; and finally all is gone and vanished for us, no less than for himself.[15] But the poems of the Cid are also as rhymed chronicles no genuine example of the Epos; and, in their later form of romances, they are, as their specific type necessitates, merely isolated situations split off from

this national hero’s life, which do not necessarily coalesce in the unity of a particular event.

The finest examples, however, of the observance of the above rule are to be met with in the Iliad and Odyssey, where Achilles and Odysseus are respectively the prominent figures. The Ramajana, too, resembles these poems in this respect. Dante’s “Divine Comedy” is an illustration, but in quite a unique way. In other words, it is the Epic poet himself with whose single personality, in his wanderings through hell, purgatory, and paradise, all and everything is so associated that he is able to recount the picture of his imagination as a personal experience, and is consequently entitled to interweave with the general substance of his composition his private emotions and reflections to a larger extent than is possible for other epic poets.

(*β*) However much then, speaking generally, epic poetry informs us of actual fact and its occurrence, and thereby makes the objective world its content and form, yet on the other hand, inasmuch as what happens is an *action,* which passes in successive views before us, it is rather, and for this reason, to *individuals*, and their deed and suffering that the main emphasis is attached. For it is only individuals, be they gods or men, who can veritably act; and just in proportion as they are interwoven in the vividness of life with such a panorama, to that extent they are entitled to attract the main interest to the fulness of their exposition. From this point of view epic poetry stands on level terms with lyric no less than dramatic poetry. It is therefore of some importance that we attempt to define more closely what the *specific* features are which distinguish the portrayal of personality in the epic composition.

(*αα*) Now, first, what is essential to the objective aspect of an epic character — I am speaking mainly of the leading personages — is that they should be themselves essentially a *totality* of such traits, in other words

complete men, and thereby display in themselves all aspects of emotional life, or to put it better, should represent in a typical way, national opinion and its active pursuits. In this respect I have already in the first part drawn attention to the heroic characters of Homer; and, in particular, to the variety of genuinely human and truly national qualities which Achilles unites in himself so vitally, the hero of the Odyssey supplying an admirable companion picture. The Cid is similarly presented us with much variety of characterization and situation, as son, hero, lover, husband, father, householder, and in his relations to king, friends, and foes. Other Epopees of the Middle Ages are a great contrast, far more abstract in their type of personification, particularly so where their heroes merely champion the cause of chivalry as such, and are removed from the sphere of the true and actual life of the nation.

It is then the fundamental characteristic of the exposition of epic personality that it should unfold itself as such a totality in the most diverse scenes and situations. The characters of tragedy and comedy may no doubt also possess a similar wealth of ideality; for the reason, however, that in their case the sharp contrast between a pathos that is never other than one-sided and a passion opposed to it is within very definable limits and ends the thing of most importance, such a varied character is in part, where it is not entirely superfluous, at least more in the nature of a prodigality which is incidental, and in part is also, as a rule, overpowered by the *one* passion, its motives and ethical considerations, and thus forced by the type of presentation into the background. In the whole of the epic composition, on the contrary, all aspects assert an equal right to assert themselves, and expand with freedom and breadth. That they should do so is indeed fundamental to the principle of epic composition; and from a further point of view the personality here, in virtue of the entire world-condition he presupposes, possesses a right to be, and to make all that valid wherein his

existence is realized, and for the good reason that he lives in an age to which precisely this *objective* being, this immediate individuality is appropriate. It is, of course, for instance, quite possible for us, with regard to the wrath of Achilles, to point out, as moral reflection may suggest, the injury and loss which that wrath entailed, and therefrom to conclude that the superiority and greatness of Achilles is very appreciably removed from any approach to ideal perfection, whether as hero or man, having no power apparently on a single occasion to moderate his anger or exercise self-restraint. But for all that we do wrong in blaming Achilles. And this is not because we may overlook the wrath in virtue of his other great qualities. Achilles is, in other words, simply nothing more or less than this portrait. So far as Epic poetry is concerned, that is the end of the matter. The same observations apply to his ambition and his love of glory. The main justification of these great characters is the energy of their achievement; they carry, in fact, a universal principle in their particularity. Conversely, ordinary morality tends to depreciate its native personality, and hold in reserve the resources of its life-force, and discovers its essential being in this attitude. What an astonishing self-esteem, for instance, an Alexander asserted over his friends and the life of I know not how many thousands. Self-revenge, even traits of brutality, testify to an energy of the same type in heroic times; and even in this respect Achilles, in his rôle of epic hero, has little to learn.

(*ββ*) And it is just on account of this fact that such preeminent figures are complete individuals, who have in resplendent degree all that concentrated in them which otherwise is diffused and separate in the national character, and thereby are throughout great, free, and humanly beautiful characters that they are rightly set in the chief place; and we find that the event of most significance is inviolably linked with such individuality. The nation is, as it were, focussed as a single living soul in them, and as such they fight out its

main enterprise, and suffer the hazards of its resulting experience. In this respect Gottfried von Bouillon, in Tasso's "Jerusalem Liberated," is no such overpowering figure as Achilles, this typical youthful bloom and perfection of the entire Grecian host; nor is he even an Odysseus, although he is selected as the wisest, bravest, and most just of leaders to command the entire army. The Achæans are unable to win a victory if Achilles stands aloof from the contest; it is he alone who, by means of his triumph over Hector, carries victory into Troy itself; and in the return home of Odysseus we find a mirror of the return of all the Greeks from Troy, only with the difference that it is just in that which it is his destiny to endure we have placed exhaustively before our vision the entire compass of the sufferings, life experience, and conditions which are implied in the whole subject-matter. The characters of the drama, on the other hand, are not so represented as in themselves the absolute crowning point of all the rest, which becomes objective in and through them. They rather are set forth independently and for themselves in their purpose, which they accept as the outcome of their character, or as the result of definite principles which have grown up in conjunction with their more isolate personality.

(*γγ*) There is a *third* distinguishing feature in epic characterization due to the fact that the Epos does not portray an action simply as action, but an event. In drama the matter of importance is that the individual manifests himself as operative for his specific purpose, and is expressly represented in such activity and its consequences. This undeviating consideration for the realization of a distinct purpose is absent in the Epic. No doubt in this case, too, heroes have desires and aims, but the main thing here is all that they may happen to experience while fulfilling it, not the nature of their conduct in the carrying it out. The circumstances are just as active as themselves, frequently more active. The return to Ithaca, for example, is the actual project of Odysseus. The Odyssey, however, does not merely display this

character in the active execution of his predetermined end, but expands its account into all the variety of occurrence which he happens to experience in his wanderings, what he suffers, what obstructions meet him in the way, what dangers he has to overcome, and all, in fact, that moves him. And this varied experience is not, as would be necessary in the drama, a direct result of his action, but is in great measure rather incidental to his journey, in the main even independent of the concurrent action of the hero. After his adventures with the Lotophagi, Polyphemus, and the Laestrygones, the godlike Circe detains him for a full year. Further, after he has visited the lower world and suffered shipwreck, he dallies with Calypso, until he falls into home-sickness, wearies of the damsel, and stares with tearful eyes over the solitary sea. Thereupon it is Calypso herself who finally provides him with the means wherewith he builds his boat, who provides him with food, wine and raiment, and takes her right anxious and kindly farewell of him. Finally, after his sojourn among the Phæacians, he is carried in sleep — he knows not how — to the shores of his island. To carry out a purposed end in this sort of way would not be possible for dramatic poetry. Again, in the Iliad, the wrath of Achilles, which, along with all else that results from this compelling force, constitutes the specific object of the narrative, is throughout not an end, but rather an emotional state. When Achilles is insulted he rages. In this condition, so far from doing anything truly dramatic, he withdraws apart, does nothing with Patroclus by the ships on the seashore, sullenly angry that he is not honoured by the lord of the folk. Then follow the consequences of his retirement, and only at last, when his friend has been slain by Hector, do we find Achilles once more plunge into the conflict. In another way, again, is the end prescribed to Æneas, which he has to carry out, where Virgil recounts all the events as the result of which its realization is in such varied ways postponed.

(γ) We have just one further important feature to mention in respect to the form of the event in the Epos. I have already observed that in the drama the conscious will, and that which the same demands and wills, is essentially the determining factor, and constitutes the permanent foundation of the entire presentation. All that is carried out appears throughout as posited already by the personal character and its aims; and the main interest above all turns upon the justification or its absence of what is done within the situations presupposed and the conflicts they bring about. If consequently it so happens also that in the drama the external conditions are themselves active, they nevertheless only retain their validity by virtue of that which conscious feeling and volition makes of them, and the ways and means under which character reacts upon them. In the Epos, however, the circumstances and external accidents are effective on level terms with the personal will itself. All that man accomplishes passes before us precisely as any other event of the world outside him, so that the human exploit is in this case likewise and equally conditioned, and must be shown to be carried forward by the development of such an environment. The individual, in short, in epic poetry does not merely act freely of himself and independently. He is placed in the midst of an assemblage of facts, whose end and actuality in its wide correlation with an essentially unified world of conscious life or objective existence supplies the irremovable foundation of the life of each separate individual. This typical system is, in fact, predominant in the Epos through all its content, whether in that of passion, determined result, or general achievement. It is true that at first sight we might expect that, on account of an equal cogency being accorded to external condition in its independent eventualities, we should find indisputable opportunity given for every shade of contingency. And yet we have seen that it is the function of the Epos to present what is truly objective — what is, in short, essentially substantive existence. The solution

of this contradiction is to be found in this, that the principle of *necessity* is involved in the events, whether taken in detail or generally.

(*αα*) In this connection we may affirm of the Epos — not, however, as is generally assumed of the drama — that *Destiny* is a predominant force. No doubt the dramatic character by the kind of end accepted, which he endeavours to carry out despite all obstruction under the circumstances given and recognized, makes of *himself* his Destiny; but in the Epos, on the contrary, it is *made for him*, and this force of circumstances, which stamp their particular form on the deed, apportions to each individual his lot, determines the result of his actions — is, in short, the genuine control of Destiny. What happens is appertinent to itself. It is so, and only thus; it is the fiat of necessity. In lyric poetry we are conscious of emotion, reflection, the personal interest, and yearning. The drama converts the ideal claim of human action into an objective presence. The presentation of epic poetry, on the other hand, moves, as it were, within the element itself of essentially necessary existence. Therefore, the individual has no choice but to follow this particular substantive condition; and, in its process of being, to adapt himself to it or not, and then to suffer as he is able and is forced to suffer. Destiny, in short, defines what is and inevitably must be, and in the result success, misadventure, life, and death are plastic precisely in the sense that individuals are plastic. What does actually unfold before us is a condition of universal expanse, in which the actions and destinies of mankind appear as something isolated and evanescent. This fatality is the great justice, and is not tragic in the dramatic sense of the term, in which the individual appears judged as a *personality*, but in the epic sense in which judgment is passed on man in all that concerns him.[16] The tragic Nemesis consists in this, that the greatness of his concerns is too great for the individual concerned. Consequently a certain tone of sadness[17] prevails over the whole. What is most glorious is seen very early to pass away. In the fulness of his life

Achilles mourns over his death; and at the conclusion of the Odyssey we view him and Agamemnon as spirits that have passed away as shades, with the consciousness that they are shades. Troy, too, falls; old Priam is slain hard by the altar of the home; women and maidens become slaves. Æneas, in obedience to the divine command, departs to found a new kingdom in Latium, and the victorious heroes only return after manifold suffering to the happiness or bitterness that awaits them at home.

(*ββ*) This necessity of events may, however, be represented in very different ways.

The most obvious and least elaborate is the bare exhibition of such events without any further explanation of the poet of a necessary element existing in the particular occurrences and their general consequence by his addition of a controlling world of gods disclosed in the decision, interference, and co-operation of eternal powers. In such a case we must, however, have the feeling brought home from the entire atmosphere of the exposition, that in the recounted events and great life-destinies of single individuals and entire families or races, we are not merely confronted with what is mutable and contingent in human existence, but with destinies which have an essential foundation, whose necessity remains, however, the obscure operation of a power which is not placed before us poetically as such a power in its divine controlling energy to the point of defined individualization and in its explicit activity. The Niebelungenlied retains this general tone strongly, albeit it does not ascribe the direction of the blood-stained final result of all committed deed either to Christian Providence or the pagan world of gods. For in regard to Christendom, we merely hear of churchgoing and mass. We have, indeed, the remark of the bishop of Spejevs to the beautiful Ute, when the heroes withdraw into king Etzel's country: "Please God, He will keep them there!" We have also no doubt dreams of warning, the prophecy of the Danube maidens to Hagen,

and other examples of a similar kind, but no really conclusive witness to the control and interference of gods. This leaves an impression on this poetry as of a something unriddled, unyielding, a mournfulness that is at the same time objective, and consequently wholly epic in its tone. It is a great contrast to the poems of Ossian, in which in the same way no gods appear, yet in which, on the other hand, we find lamentation over the death and downfall of the entire heroic stock presented under the form of the private sorrow of the dismayed minstrel, and as the yearning of a woe-begone recollection.

Essentially distinct from the above type of conception is the complete interlacement of all human destiny and natural event with the resolution, volition and action of a many-sided world of gods such as we find in the great Hindoo Epopees, and in Homer, Virgil, and others. I have already expressly drawn attention to the varied poetic interpretation which the poet himself supplies of events, which are apparently accidental, through his assumption of the co-operation and apparition of gods, and attempted to enforce the same by particular examples from the Iliad and the Odyssey. Here we may observe that the condition of most importance to the poetry in question is that in this reciprocal action of gods and men the relative independence of both aspects is maintained, so that neither the gods fall into lifeless abstractions, nor the human individuals become purely subservient vassals. How such a danger is to be avoided I have already discussed at length in a previous passage. The Hindoo Epos is in this respect unable to force its way fully to the truly ideal relation between gods and mankind; on such a stage of imaginative symbolism the human aspect still remains aloof in its free and beautiful actuality, and the activity of individuals in part appears as the incarnation of gods, and in part, as something of more incidental merit, vanishes, or is depicted under the guise of ascetic exaltation to the condition and power of gods. Conversely the variously

personified powers, passions, genii, angels, and so forth, that we meet with in Christendom possess for the most part too little individual independence, and consequently tend only to affect us in a cold and abstract sort of way. The case is much the same in Mohammedanism. Through the deification of Nature and the world of mankind, through the conception of a prosaic co-ordination of reality, it is hardly possible to avoid the danger, more particularly where we enter a region of fairyland, wherein a miraculous interpretation is given to that which is essentially contingent and indifferent in external circumstances, which are themselves only present as a simple occasion for human action and as the ordeal of individual character, without possessing therewith an ideal consistency and foundation. By reason of this no doubt the infinitely extensible connection of cause and effect is broken, and the many sections in this prosaic concatenation of circumstances, which cannot be throughout made clearly distinct, are brought all of a sudden into one union. If, however, such a result is secured without the principle of necessity and ideal reasonableness, such a mode of elucidation, as, for example, frequently in "The Thousand and one Nights," appears as little more than the sport of an imagination, which endeavours to unfold as causality possible and actual, by means of such inventions, what is otherwise incredible.

The fairest mean, on the other hand, in this respect is that retained by Greek poetry, inasmuch as it is able to bestow both on gods and men a reciprocally indestructible power and freedom of independent individuality. And such is harmonious with its fundamental standpoint.

(*ββ*) There is, however, particularly in the epic conception of it, a point of view relative to the collective world of gods, which I have already referred to above in another connection. This is the contrast which the *primitive* Epopee presents to the *artificial* composition of later times. This difference is very pronounced if we compare Homer and Virgil. The level of

education, from which the Homeric poems originated, still continues in a fair harmony with the poetic subject-matter. With Virgil, on the contrary, we are reminded by every single hexameter that the general outlook of the poet is totally different from the world, which it is his endeavour to depict; and the gods more particularly have lost the freshness of their original vitality. Instead of being living persons in their own selves, actual witnesses to us of their existence, they have rather the appearance of being mere creations of the poet and external instruments, which it is neither possible for the poet or his audience to take quite seriously, although there is an open pretence made that they have been taken thus seriously. Throughout the whole of the Virgilian Epic we feel ourselves in the atmosphere of ordinary life; the old tradition, the saga, the fairyland of poetry enters with prosaic distinctness into the frame of our common-sense faculties. What we have in the Æneid is very much what we find in the Roman history of Livy, where ancient kings and consuls make speeches, precisely as an orator made his speech in the Agora of Rome, or the school of the rhetoricians in the days of Livy himself. And, on the other hand, in what is really retained from tradition, as an example of primitive speech, such as the fable of Menenius Agrippa[18] about the functions of the belly, we find a contrast which is almost repulsive. In Homer, however, the gods are wafted in a magical light between poetry and reality: they are not permitted to approach the imagination so nearly, that the apparition of them confronts us with all the detail of ordinary life; nor are they left so undefined, that they lose all appearance of vital reality as we look at them. All that they do is readily explained by the soul-life and activities of men; and that which supports our faith in them is the substance and content upon which they essentially repose. From this point of view the poet, too, is thoroughly in earnest with his creations, though he treats with irony their form and external reality. In agreement with this it appears that the ancients themselves believed in this

external form merely as works of art, which receive their confirmation and significance as a gift of the poet. This light-hearted and human freshness of presentment, in virtue of which the gods appear human and natural, is one of the pre-eminent qualities of the Homeric poems. The divine figures of Virgil float before our vision as so many invented wonders, as members of an artificial system. Virgil has not wholly escaped the charge of mere travesty, despite his earnestness; nay, this earnest mien of his is rather the cause of it, and Blumauer's Mercury with his boots and spurs and riding-whip is not without its justification. There is no necessity for any one else to make the Homeric gods ridiculous. His own picture of them makes them quite ridiculous enough. Nay, in his own story the gods themselves have their laugh over the lame Hephestus, and over the cunning net in which Mars lies in company with Venus, to say nothing of the box on the ear that Venus gets, and the howl of Mars as he collapses. By means of these touches of natural lustiness and gaiety the poet at once liberates us from the external form which he set up, and enforces all the more emphatically our common human nature, which he values, and which suffers, however, the necessary and substantive power involved therein, and the faith in the same, to remain. But one or two more examples of similar detail. The tragic episode of Dido is so entirely to the modern colour, that it was able to inspire a Tasso with emulation, nay, even in part to a literal translation. Even nowadays the French are moved to something like ecstasy over it. And yet how totally different in their human naïveté, simplicity and truth are the Homeric narratives of Circe and Calypso. The contrast is the same in Homer's account of the descent of Odysseus into Hades. This obscure and twilight like retreat of the shades is shown us through a dusky cloud, in an intermingling of imagination and reality, which takes hold of us with astonishing force. Homer does not suffer his hero to descend into any Underworld ready to hand. Odysseus himself digs a pit, and pours therein

the blood of a ram he has killed; he summons the shades, which are then under constraint to circle round him, and bids some of them drink fresh blood that they may address him, and give him news, and drives away others with the sword as they throng round him in their thirst for life. Everything that happens here is bound up with the life of the hero, whose general demeanour is the reverse of the humble attitude of Æneas and Dante. In Virgil's account Æneas descends in the ordinary way; and the flight of steps, Cerberus, Tantalus, and all the rest leaves us with the impression of a definitely organized family establishment, quite to the pattern of an orthodox compendium of mythology.

With yet more force will this artificial *compôte* of the poet appear as such rather than a work that springs naturally from the subject where we are already cognisant of the substance of the tale that is told us in its fresh and primitive form, or as actual history. Examples of this are Milton's "Paradise Lost," the "Noachid" of Bodmer, Klopstock's "Messias," Voltaire's "Henriade," and others. In all these poems we cannot fail to detect a real cleft between the content and the reflection of the poet which modifies his description of the events, characters and circumstances. In Milton's case, for example, we find emotions and observations obviously the growth of an imagination and ethical ideas inseparable from his own age. In the same way with Klopstock we have God the Father, the history of Jesus Christ, patriarchs and angels combined with our German education of the eighteenth century, and the ideas of Wölffian metaphysic. This twofold aspect asserts itself in every line. No doubt in these cases the content itself offers many difficulties. For God the Father, the heaven of the angels, and the angelic host are far less adapted to the individualization of a free imagination than are the Homeric gods, which, in a manner similar to the in part fantastic creations in Ariosto, in their external mode of appearance, and so far as they do not epitomize[19] human action, but rather independently

confront each other as individuals, do of themselves suggest the gibe over such a presentment.[20] Moreover Klopstock, so far as a religious outlook is concerned, introduces us to a world devoid of foundation, which he crowds with the brilliant effects of a rather exhausting imagination, and compels us to take everything as seriously as he means it himself. This is particularly unfortunate in the case of his angels and devils. Such creations only really have substance and can be brought home to us in their individuality in so far as the material of their actions, as with the Homeric gods, is rooted in the spiritual experience of humanity, or in a reality already known to us, as in cases where they claim importance as being the guardian spirits or angels of men or cities, but who, apart from such a concrete significance, assert what is just so much the more merely the vacancy of imagination in proportion as a serious actuality is ascribed to them. Abbadona, for instance, the repentant devil,[21] possesses neither a truly allegorical meaning — for in the abstract notion of devil there can be no inconsistency of guilt which can be converted into virtue — nor is such a figure one that is essentially and truly concrete. If Abbadona were a man, a conversion to God would no doubt be reasonable; but where we have evil regarded as something independently substantive, which is not an individual human evil, such a conversion is merely a triviality of sentimental emotion. It is in fact a distinguishing characteristic of Klopstock's invention that it creates such unreal personages, conditions and events, which have nothing in common with the actual world and its poetical content. And he fares no better in the machinery of his judicial condemnation of riotous living in high places, least of all in the contrast he presents to Dante, who condemns the famous personalities of his time to hell with a power of detailed realization of another type altogether. Equally destitute of real content as poetry is the joy of the resurrection among the assembled spirits of Adam, Noah, Shem, Japhet, and the rest, as depicted by Klopstock, who, in the 11th canto of the

Messias, at the command of Gabriel, once more revisit their graves. Reason and rational ground are alike absent here. The souls have lived in the Divine Presence; they now behold the Earth, but they enter into no renewed relation with it. We may presume that they could not do better than appear to men; but of this there is not a single example. No doubt we find here beautiful emotions, endearing situations; and above all the moment in which the soul is once more united to a body is depicted in a way that arrests us; but the *content* remains none the less an invention that possesses no real claim to credibility. In contrast to such abstract ideas the blood-drinking of the phantoms in Homer, their reanimation in memory and speech, possess for us infinitely more the truth and realization of ideal poetry. And though from the point of view of imaginative resource these pictures of Klopstock are decorative enough, what is most essential in them is throughout the lyrical rhetoric of angels, who appear merely as instruments of service, or of patriarchs and other Biblical figures whose speeches and harangues have little in harmony with their historical characters as we have received the same from tradition. Mars, Apollo, War, Knowledge, and so forth — powers of this kind are neither in respect to their content wholly inventions, as the angels are, nor are they simply historical persons borrowed from historical sources, as are the patriarchs; they are on the contrary permanent forces, whose *form* and mode of appearance is alone the *poet's creation.* In the "Messias," however, admitting its excellence in certain directions — its purity of feeling, the brilliancy of its phantasy — yet it cannot be denied that by reason of the very type of such a phantasy we have here very, very much indeed that is hollow, without definite substance, and utilized simply as machinery for something else, all of which, combined with the absence of continuity in the content and its mode of conception, has even already covered the entire poem with oblivion. Things only live and remain green, which, essentially

vital in themselves, unfold to us original life and activity in their pristine mould. For this reason we must hold fast to the primitive Epopees, and keep aloof, not only from modes of conception which are antagonistic to the actual presence which is vindicated in such, but also and above all from false aesthetic theory and predilection, at least if we are really anxious to enjoy and study the original world-outlook of nations, that great and spiritual[22] natural history. We have every reason to congratulate recent times, and our German nation in particular, that it is now on the road to the attainment of this object; that it has, in short, broken through the former obtuseness, of ordinary methods of thinking, and by its liberation of the mind from restricted views made it more receptive to ideas of the world which it is imperative that we as individuals enter into, and which alone are able to restore to us, to the full extent of their claim, the resurrected spirits of nations, whose ideal significance and deed thus appear struck into life in these their own Epopees.

(*c*) *The Epos as Unified Totality*

Hitherto, in considering the necessary qualifications of a genuine Epos, we have on the one hand discussed the *general* world-environment and from a further point of view the nature of the particularized event transacted on such a background by *individuals* either acting under the direction of gods or subject to destiny. These two fundamental aspects have yet further to coalesce in one and the same epic totality. In respect to this I will merely confine the reader’s attention to the following points of interest:

In the *first* place we propose to consider the *collective aggregate of objects*, a satisfactory exposition of which is necessary to disclose the connection between the particular action and the substantive ground referred to.

Secondly, we have to examine the nature of the difference which obtains between the epic mode of *disclosure* and that of lyric or dramatic poetry.

Thirdly we have to deal with the *unity* in which an epic composition is rounded off despite all its breadth of extension.

(*α*) The content of the Epos, as already observed, is the entirety of a world in which an individual action is eventuated. In such a world the greatest variety of objects appear necessarily appertinent to the general views, deeds, and conditions of such a world.

(*αα*) Lyrical poetry is, no doubt, involved in definite situations, within which the subject of the lyric is permitted to import a great variety of content into its emotion and reflection. In this type of poetry, however, it is throughout the form of conscious life itself which characterizes such content; and for this reason excludes the outlook on the objective world in all its breadth of extension. Conversely the dramatic composition presents us characters and the carrying out of the action itself with all the animated appearance of life, so that here, too, the portrayal of local accessories, the external form of the active personages and all that happens, in the nature of the case tends to disappear. As a rule, what we have to express is the soul-motive and purpose rather than its extensive relations with the surrounding world of objects, or a description of individuals in their positive appearance as part of them. In the Epos, however, quite apart from the national actuality in the widest sense, upon which the action is based, we must find room for the ideal or soul aspect no less than the external or world aspect. We have in this type, therefore, under review and in coalescence the entire totality of all that we may reckon as comprised in the poetic presentation of our human existence. In this content we must not merely include on the one side the natural environment in the sense of this or that specific locality in which the action takes place, but also the more universal objective outlook such as I have already pointed out is a feature we find illustrated in the Odyssey, enabling us to understand how the Greeks in the times of Homer regarded the shape of the Earth, the configuration of the seas, and similar

geographical facts. At the same time these natural aspects are not the object of most importance in the poem; they are merely the foundation; there is, in short, the further and more essential aspect of the composition unfolded in the existence, activities, and co-operation of the entire world of divinities; and between these two extremes we have humanity simply as such in its collective relation to domestic, public, peaceful, and warlike situations, ethical habit, customs, characters and events. And, moreover, throughout we have to assume in both directions, whether that is from the point of view of the individual event, or the general condition, the all-embracing national and other actual complexus.

Finally, if we consider the nature of this intelligible content it is not merely an external *événement* that is presented us, but in conjunction with such we must have, too, placed before us the ideal world of emotion, the aims and purposes of mind, all that may contribute to justify or condemn a deliberate line of conduct. In short, the real subject-matter of lyric and dramatic poetry is not wholly excluded, although in the epic type these aspects merely are valid as subordinate features; they do not, as in the former cases, constitute the essential form of the exposition, nor do they deprive the Epos of its distinctive character. We may consequently affirm that the distinctive note of the Epic is absent, when lyric expression determines both tone and colour, as is the case, for example, in Ossian, or when passages are emphasized in which the execution of the poet is made as consummate as possible, as is to some extent the case with Tasso, and to a still more marked degree characteristic of Milton and Klopstock. Emotions and reflections ought rather, no less than the portrayal of objective fact, to be transmitted as something done, already spoken and thought, and not interrupt the tranquil course of the Epic narrative. The incoherent exclamation of emotion, the direct outcry of the soul mainly intent with its utterance upon self-revelation, is out of place in such poetry.

It will for the same reason and as strongly abstain from an imitation of the animation of dramatic dialogue, in which individuals carry on a conversation as though face to face with each other, where the aspect of most importance throughout is the contrast presented by different types of character in their interchange of speech as they strive to convince, command, impose upon, or passionately unravel their motives to one another.

(*ββ*) And, *secondly*, the Epos has not merely to bring before our vision the manifold content above described in its actually independent and subsistent objective form, but also the form in which it essentially becomes the Epos is, as I have more than once already described it, an *individual* event. If this essentially limited action is to remain united with all other material introduced, this additional accretion of fact, must throughout be brought into definite relation with the course of the individual event, that is to say, it must not fall outside it as independent. We could not find a more perfect illustration of this interweaving of all threads than that of the Odyssey. The domestic arrangements of the Greeks, for instance, no less than the ideas we get of foreign and barbarous folk and countries, or of the realm of the shades, and much else, are so closely interwoven with the personal wanderings of the home-returning Odysseus and the fortunes of Telemachus on his journey after his father, that not one of these aspects of the tale is held in a loose and independent position apart from the main event, or, as with the chorus of tragedy, which does not usually enter into the action and merely deals with generalized reflections, is able to relapse inactive into retrospection, but co-operates in the actual progress of the event. In a similar manner Nature also and the world of gods for the first time receives, not so much on their own account as in their relation to the particular events, which it is the function of the godlike to direct, an individual representation and one of rich vitality. Only when such a

condition is fulfilled, or, in other words, when the narrative throughout informs us of the progressive movement of the event, which the poet has selected as the unifying material of his composition, can it never appear as a mere portrayal of independent objects. On the other hand, the particular event for its part should not be involved in and absorb the substantive national basis and totality upon which it moves forward to such a degree, that these are themselves divested of all independent existence, and fall by necessity into a relation simply of service. In this respect the expedition of Alexander against the East would not supply satisfactory subject-matter for the true Epopee. An heroic exploit of this kind not merely in respect to the original resolve, but also to its manner of execution, depends so entirely on this *one* single individual, his personality and character is so exclusively that which supports it, that we lose altogether the independent existence and self-assertion of the national basis, the host and its leaders, which we have shown to be a necessary condition. Alexander's army is his people, wholly bound up with him and his command: it follows him rather in the relation of vassalage than that of free will. In contrast to this the true vitality of the epic consists in this, that both these fundamental aspects, the particular action with its individual agents and the general world-condition, while no doubt continuing under a mediated relation, yet in this relation of reciprocity no less preserve their necessary independence and thereby enforce themselves as one existing whole, at the same time securing and possessing an independent entity.

(*γγ*) In a previous passage we laid it down generally that in order to have an individual action the substantive basis of epic poetry must offer the opportunity of collisions, and furthermore observed, that the general foundation must not appear as wholly independent but under the form of a specific event; we may now add that it is in this individual *événement* that we must seek the point of *departure* for the entire epic poem. This is pre-

eminently of importance for the situations connected with its commencement. Here, too, we may take the Iliad and Odyssey for models. In the first the Trojan war is placed before us as the general background of contemporary life, but only so far as it comprises the particular events connected with the wrath of Achilles. And for this reason the poem commences without any possible confusion with situations which excite the passion of the principal hero against Agamemnon. In the Odyssey there are two classes of subject-matter which determine the content of its opening, that is to say, the wanderings of Odysseus and the domestic complications at Ithaca. Homer brings them together by giving us briefly information concerning Odysseus on his home-journey to the effect that he is detained by Calypso, and then at once passes to the sorrows of Penelope and the voyage of Telemachus. We are, consequently, able to review at one glance what obstacle stands in way of the return, and what is consequently rendered necessary for those left behind at home.

(*β*) The advance, then, of the epic poem from a commencement such as this is totally different from that of lyric or dramatic poetry.

(*αα*) In the first place we should draw attention to the possibilities of *extension* within the range of the Epos. These are quite as much due to the form as they are to the content. We have already seen what a variety of objects may be comprised in the world of the Epic as fully elaborated, not merely in its ideal capacities, motives, and aim, but also in respect to its objective situation and environment. Inasmuch as all these aspects assume an objective form, an appearance of reality, each one of them takes to itself a form of essentially independent ideality and externality, in which the epic poet, either in his exposition or description, is permitted freely to linger, and to disclose in its positive appearance. The lyric, on the contrary, concentrates all that it lays hold of within the ideal realm of the emotions, or refines it away in the generalized vision of reflection. In the objective

world it is the immediate complex in juxtaposition, or the varied wealth of manifold characteristics, which is presented us. In this respect we find that in no other type of poetry is the claim to introduce episodical matter, even to the point of to all appearance absolute independence, more indisputable than in the Epos. The delight, however, in actual fact for its own sake and in its natural form must, as already observed, not be carried so far as to import into the poem circumstances and facts which have no real connection with the important action. Such episodes must assert themselves as effective in the advance of such action, whether as events which are obstructive to its course, or assistant in their mediation. Yet, despite of this, the particular portions of the epic poem will be somewhat loosely bound together. This is a necessary result of the mode of its objectivity. For in what is objective mediation persists as the ideal essence; what in contrast to this confronts the external aspect is the independent existence of particular aspects. This defect in the direction of a stringent unity and the emphasized relation of specific portions of the epic poem, which, according to its primitive form, possesses moreover a primitive period of origination, has this result, that it lends itself more readily than lyric or dramatic compositions to subsequent additions and continuations; and, further, it is enabled to appropriate under its more recent and embracing whole even examples of the saga which have already received artistic expression of a definite, if not so exalted character.

(*ββ*)*Secondly*, if we look at the way in which epic poetry may be justified in its *motivisation* of the progress and course of events, we shall find that it ought not either exclusively to take the ground of what happens from the individual mood, nor yet from what is purely personal character. In other words, it should not encroach upon what is the proper sphere of the lyric and drama; it must, in this respect too, adhere to the form of objectivity which constitutes the fundamental epic type. We have, in fact, seen more than once previously that external conditions were of no less importance,

for an exposition that takes the form of narrative, than states of soul which revealed character. In the Epos character and the necessary rational condition coalesce completely on terms of equality, and the epic character may therefore give way to external conditions, without impairing his poetic individuality, may be, in short, in his action, the result of relations in such a way that these appear as the predominant factor rather than the exclusively effective character as we find it in the drama. We find in the Odyssey that the progress of events is almost entirely motived in this way. We find the same thing in the adventures of Ariosto and other Epopees, where the material of the song is borrowed from the the Middle Ages. The divine command, too, which induces Æneas to found Rome, no less than the varied episodes which extend its embrace over a wide field, would involve a type of motivisation wholly uncongenial to the drama. A further illustration of this is Tasso's "Jerusalem Delivered," in which, quite apart from the brave antagonism of the Saracens, many a natural event is opposed to the object of the Christian host. Such examples might be indefinitely multiplied from almost all the more famous Epopees. And, indeed, it is precisely material of this kind, in which an exposition of this type is possible and necessary, that the epic poet ought to select.

The same thing is effected where it is bound to appear as the result of the actual decision of individuals. Here, too, we have neither to assert nor to express that which the character in the dramatic sense of the term — that is, according to his aim and the individual passion which uniquely animates him — makes of the circumstances and relations, in order to maintain his personality against this external resistance no less than against other individuals. Rather the epic character excludes this action viewed simply in reference to its personal character, just as it excludes the tumult of purely subjective states and feelings. Instead of this it cleaves fast, on the one hand, to the circumstances and their reality; and on the other that, whereby

its movement is effected, must necessarily render explicit all that is essentially valid, universal, and ethical. In Homer, as in no other writer, we shall find inexhaustible material for pertinent thought on this head. The lament of Hecuba over Hector, for instance, or of Achilles over the death of Patroclus — episodes which, so far as content is concerned, would lend themselves admirably to lyric treatment — are in Homer held throughout within the epic temper. And to quite as little extent do we find this poet handle in dramatic style situations which would primarily adapt themselves to dramatic exposition, such as the conflict between Agamemnon and Achilles in the council of the chiefs, or the parting of Hector and Andromache. Only to glance at the last-mentioned scene, this belongs unquestionably to one of the finest conceivable efforts of epic poetry. Even in Schiller's dialogue between Amalia and Carl in "The Robbers," where the same subject ought to be treated in the lyric vein throughout, we distinctly hear an epic reverberation from the Iliad. How consummately epic in its effect, however, is Homer's description in the sixth book of the Iliad of the way in which Hector vainly seeks for Andromache at home, then at last meets her on the way to the Scæan gate, how she hurries toward him, and when close to him, as he looks with a peaceful smile on his little boy lying on the arm of his nurse, exclaims: "Amazing man, thy courage will destroy thee, and thou compassionest neither thy infant boy nor me, hapless wight, who will soon be widowed of thee. Ay, for soon the Achaeans will slay thee, storming against thee together. And if I lose thee it were better for myself to pass beneath the earth. No other comfort is left for me, but only sorrow, if thou art stricken by fate! Neither have I my father any more, nor yet my lady mother." After which she narrates at length all the story about her father and the death of her seven brothers, all of whom Achilles had slain, also the captivity, ransom, and decease of her mother. Then at length she turns with earnest plea to Hector, who is henceforward to

her father and mother, brothers, and spouse in the bloom of life, and implores him to remain on the walls, and not to make his son an orphan and his wife a widow. Hector replies in much the same spirit: “All this is also a care to me, wife; but I fear too much the Trojans, if I avoid the battle here, like a coward; the eddy, too, of the moment worries me not, who am wont to be ever dauntless, and to fight in the foremost ranks of the Trojans, protecting the high fame of my father and mine own. Ay, well indeed I wot, both in mind and soul, that the day will come in which sacred Troy shall fall, as also Priam and the folk of the king cunning with the spear. But I sorrow not so much for the Trojans, nor yet for Hecuba herself and Priam, nor the brothers of my flesh, who shall fall beneath the foe, as for thee, when some bronze-greaved Achæan shall bear thee away, robbing thee of thy day of freedom, and thou shalt spin from the flax of another in Argos, or wearily draw water, loth indeed, but the might of necessity will be upon thee; and I doubt not there will be someone who will say, as he sees thee weeping: ‘See yonder Hector’s wife, the bravest of all who fought among the Trojans when the fight was over Ilium.’ Thus perchance shall someone speak; and woe will come upon thee, that thou hast no longer such a husband, to fend thee from such serfdom. As for myself, may the earth cover me, or ever I hear thy bitter cry and thy carrying off.” All that Hector says here is full of feeling, pathetic enough, yet not merely expressed in a lyrical or dramatic manner, but in the epic vein, inasmuch as the picture which he outlines of suffering, and which brings pain to himself, in the first place depicts circumstantially objective conditions as such, and in the second place because all that affects and moves him does not appear as personal volition, or individual resolve, but rather as a necessity which is not at the same time his own aim and will. Of much the same epic effect are the pleas with which the vanquished plead, as they may on various grounds, for their life with their victors; for a movement of the soul, which proceeds

merely from circumstances, and only attempts to affect us through the causative effect of objective relations and situations, is not dramatic, although modern tragedians from time to time also make use of such a type of effect. The scene, for example, in Schiller's "Maid of Orleans," on the battle-field between the English knight Montgomery and Joan,[23] is, as others have already justly observed, rather epic than dramatic. In the moment of danger all courage forsakes the knight; yet, for all that, when pressed by the fierce Talbot, who punishes cowardice with death, and the Maid, who conquers even the bravest, he is unable to have recourse to flight, and exclaims:

O, wär ich nimmer über Meer hieher geschifft,
Ich unglücksel'ger! Eitler Wahn bethörte mich,
Wohlfeilen Ruhm zu suchen in dem Frankenkrieg,
Und jetzo führt mich das verderbliche Geschick
In diese blut'ge Mordschlacht. Wär ich weit von hier
Daheim noch an der Savern' bluhendem Gestad
Im sichern Vaterhause, we die Mutter mir.
In Gram zurückblieb und die zarte süsse Braut.[24]

Expressions such as these are unmanly, and make the figure of this knight neither fit for the genuine Epos nor the tragic drama, are in fact rather suggestive of comedy. And when Joan, after exclaiming,

Du bist des Todes! Eine britt'sche Mutter zeugte dich![25]

advances towards him, he throws away sword and shield and pleads at her feet for his life. The reasons he gives at length in order to arouse her sympathy: his defencelessness; the wealth of his father, who would ransom him with gold; the gentleness of the sex to which Joan belongs as maid; the love of his sweet bride, who waits for his return home in tears; the grief of the parents whom he has left at home; the grievous fate of death unwept for

in a foreign land — all these motives are themselves, in one aspect of them, essentially objective conditions, effective and of value as such, and on the other hand, the tranquil exposition of them is itself in the epic vein. In the same way the poet motives the condition, that Joan must hearken to him, through the external circumstance of the defencelessness of the pleader, although from the dramatic point of view she ought without delay and at the bare sight to have slain him, being as she was the relentless foe of all Englishmen, and in fact expresses such destructive hatred with every resource of rhetoric, justifying her action by the statement that she is bound with most fearful vow to the spirit-world.

Mit dem Schwert zu tödten alles Lebende, das ihr
Der Schlachten Gott verhängnissvoll entgegenschickt.[26]

If the point of importance to the maid were merely that Montgomery ought not to die defenceless, he possessed apparently an excellent means in his grasp of retaining his life; in other words he had merely to refuse to take up his weapons. This view is supported by the fact that Joan has already listened to him so long. Yet when she demands that he should fight for his life with her, of mortal flesh like himself, he again takes up his sword and falls by her hand. Such a *development* of the scene had been more in keeping with the drama had it dispensed with all this varied epic exposition.

(*γγ*) In general, then, we may characterize the type in which we have the poetic passage of epic events set before us in the following way, namely, that the epic presentation does not merely linger over the picture of objective reality and ideal conditions, but over and above this provides *obstacles* to a final solution. This not only applies to its relation to the wide field of external condition, to which the more immediate vision enforces us, but also in respect to the culminating movement of the action, more

especially in its contrast to dramatic poetry. For this reason above all it diverts us from the execution of the fundamental purpose, the connected course of whose evolved conflict a dramatic poet ought never to lose sight of, into much digressive matter; and, moreover, by this means avails itself of the opportunity, to bring before our vision the complex unity of a world of circumstances, which otherwise could not have been expressed in speech. We have an illustration of such an obstacle in the beginning of the Iliad. Homer here at once tells us about the fatal sickness, which Apollo had spread throughout the Greek camp, and connects with it the strife between Achilles and Agamemnon. This wrath is the second impediment. Even more obviously in the Odyssey is every adventure that Odysseus has to pass through, a delay to his home return. More particularly, however, the distinct episode serves to interrupt the unimpaired progression of the story, and is to a great extent an obstacle to this. Such, for instance, is the shipwreck of Æneas, his love for Dido, the appearance of Armida in Tasso, and we may add as a rule the many independent love affairs of particular heroes in the romantic Epos, which, in the poetry of Ariosto, accumulate and interlace with such profusion, that the conflict between Christian and Saracen is thereby entirely hidden. In the "Divine Comedy" of Dante we do not find such definite examples of obstruction to the plot or narrative. In this case we must associate the slow advance of the Epic denouement partly with the generally pausing manner of the description, and in part with the many little episodical histories and conversations with particular characters, whether damned or otherwise, about whom the poet permits himself more detailed information.

In this connection it is above all things necessary that impediments of this description, which interfere with the flow of narrative to its final end, should not be presented as though they were merely means directed to objects of an objective character. For inasmuch as already the general

condition, on the basis of which the movement of the epic world is carried forward, is only truly poetical where it appears as a self-constructed growth, so too its entire course, either in virtue of circumstances or the inherent destiny, must also appear self-originated without our being able to detect thereby the personal views of the poet; and this is all the more so because, in the form of its objectivity — not merely under its aspects of phenomenal reality, but also in respect to the substantive character of its content — it claims for the whole no less than its divisible content that it is a positive growth, spontaneous in its origin and independent. If, however, a directive world of gods is its apex, controlling the course of events, it is even more necessary that the poet himself should possess a lively and vivid faith in them, because in that case it is generally through the instrumentality of these that obstructions such as we have referred to are asserted; consequently where these divine forces are treated merely as some lifeless mechanism, it is inevitable that everything for which they are responsible must equally become so in a poetic composition which is artificial even in intention.

(*γ*) Having thus briefly adverted to the totality of objects, which the Epos is able to unfold by interweaving a particular event with a universal national world-condition, and, further, having discussed the manner in which the course of events is developed, we have now, *thirdly*, and in conclusion, to examine the problem as to the nature of the *unity* and *rounding off* of an epic composition.

(*αα*) This is a point all the more important for the reason that in our own day people are ready to take up the view that we may end an Epic as we like, or continue it just as capriciously. Although this is the opinion of men of talent and learning — it is in fact the contention of F. N. Wolff — it remains none the less a crude and illiterate view. It in fact amounts to

nothing less than excluding from the finest ethic compositions any genuine character of artistic composition. For it is only in virtue of the fact that an Epos depicts an essentially exclusive, and thereby, for the firs time independent world, that it is at all a work of fine art in contrast to what is, in part, the diffuse, and, in part, the finite, series of independent sections, causes, effects, and other modes of self-causative reality. One can, of course, so far admit that for the genuine and primitive Epos the wholly aesthetic review of the design and organization of the parts, of the position and completion of the episodes, of the kind of similes employed, and so forth, this is not the point of most importance, inasmuch as here, more than in lyrical poetry of a later date, and its artificial elaboration of the drama, the general world-outlook, the faith in divine beings, and, in a word, what is most essential in such national Bibles, must be expressed as the aspect of most weight. Nevertheless, these great national books, such as are the Ramajana, the Iliad, and the Odyssey, and even the "Song of the Nibelings," ought not to lose that quality which alone, in respect to both their beauty and their art, can endow them with the worth and freedom of artistic works, the quality, that is, whereby they bring before our vision a complete sphere of action. What we have simply to do, therefore, is to discover the appropriate form of this exclusive unity.

(*ββ*) The term Unity, if employed in this general sense, has become a very commonplace one even for tragedy, one capable of much misuse. For every event, in its causes and effects, creates an infinite chain, which, in the direction of the past no less than the future, and in a way that is in both directions incalculable, leads to a further series of particular circumstances and actions, it being impossible to determine all that may form part of the circumstances and detail in other respects, or the mode of their coalescence. If we merely confine our attention to this series, no doubt an Epos may be extended backwards and forwards indefinitely; and, over and above this

such always offers opportunity for digression. But it is just such a series as this which makes the composition prosaic. To adduce an example the Greek cyclic poets have celebrated the entire cyclus of the Trojan war, and in doing so continue at the point where Homer stops, with a beginning, too, from the egg of Leda. But it is precisely on account of this that they degenerate into prose, if we contrast them with Homer's compositions. Just as little — I have already drawn attention to this — can an individual as such surrender the central focus of his unity, inasmuch as it is from this that the most varied events issue, and are able to effect a union in the same, though they may be entirely without connection regarded simply as events. We have consequently to seek for another type of unity. In this respect we must briefly determine the distinction between a mere *event*, and a *definite action*, which accepts the form of event in the epic narrative. We may define a mere event as the external aspect and realization of every human action, without involving with it the execution of a particular end; or, in general terms, we may call it every external modification in the form and appearance of what actually exists. When anyone is struck by lightning, that is a mere event, an external occurrence. More is implied in the sack of a hostile city; we have here the fulfilment of a predeterminate purpose. An essentially distinct object of this kind, such as the liberation of the Holy Land from the yoke of the Saracens and heathen, or better still the satisfaction of a specific impulse, such as the wrath of Achilles, must, under the mode of the epic eventuality, constitute the synthetic unity of the Epopaea; and by this I mean that the poetic narrative must restrict itself to that which is uniquely the effect of this conceived purpose or specific impulse, and in this co-operation be rounded off in an essentially exclusive unity. Action and execution of this type is, however, only possible to human agency; so that, as the culminating point of our composition, we must have in progressive conjunction with purpose and impulse a *human personality.*

Furthermore, if the action and satisfaction of the entire heroic character, from which both purpose and impulse proceed, are merely the result of wholly definite situations and motives, which are dissipated as we look back in an extensive complexity of relation, and if, further, the execution of the purpose, as we look forward, carries with it a variety of result, then in that case on the one hand no doubt a large number of presuppositions will be involved with such a specific action, and on the other hand we shall have many effects of reaction, which, however, will not be placed in any more intimate poetic connection with just this determinate character of the end under exposition. In this sense, for instance, the wrath of Achilles has as little connection with the rape of Helen or the judgment of Paris, although the one fact is presupposed in the other, as it has with the actual sack of Troy. When, therefore, it is contended that the Iliad neither possesses a necessary beginning, nor an appropriate conclusion, such a verdict is due to an inability to see distinctly that it is the wrath of Achilles which is the main subject of the Iliad, and which consequently should supply the focus-point of unity. If, on the contrary, we form a stable conception of the heroic figure of Achilles, and assume that this, as asserted in the wrath aroused in him by Agamemnon, is the connecting thread of the whole, we shall be unable to conceive either a beginning or termination of greater beauty. It is, as I have already pointed out, the direct motive of this anger, which forms the poem's commencement; the consequences of the same are comprised in all that follows. Against this critics have attempted to enforce the view that in such a case the last cantos are irrelevant, and might just as well be omitted. Such an opinion, if we look at the poem itself, is untenable. For just as the dallying of Achilles himself by the ships and his abstinence from the conflict are purely the result of his indignant wrath, and are in this inactivity bound up closely with the almost immediate success of the Trojans over the Grecian host, no less than with the fight and death of Patroclus, so, too, the

lament and revenge of the noble Achilles and his victory over Hector is closely linked with this fall of his brave friend. If in the previous opinion it is implied that death is the end of everything, and after that we may as well pack and be off, such a view merely indicates extreme crudity of imaginative conception. With the idea of death it is merely *Nature* that is brought to a standstill; man is not so, nor yet are the obligations of his *ethical life* and *habit*,[27] with their claim of honourable recognition for the fallen hero. In this sense the sports that form part of the funeral rites of Patroclus, the heartrending pleas of Priam, the reconciliation of Achilles, who returns the father the corpse of his son, in order that in this case, too, honour to the dead may not be absent, each and all are connected with the previous events, and contribute to the supreme and satisfying beauty of the narrative's conclusion.

(*γγ*) Inasmuch, however, as we have attempted above to make a specifically individual action, which issues in accordance with a deliberate purpose or heroic impulses, conform to the type of an epic whole in which focal points are ascertainable that bind it together and round off its completeness, the view is at least possible that we have made the *unity* of the Epos too nearly identical with that of the *drama.* For in the drama also it is *one* particular line of action issuing from self-conceived purpose and character with its conflict which constitutes the focal centre. In order, therefore, not to involve these two types of poetry, the epos, that is, and the drama, in confusion, though the confusion merely appear to be such, I will yet again draw the reader's attention emphatically to my previous explanation of the distinction between human action and event. And quite apart from this the epic interest is not simply confined to those characters, objects, and situations which have their ground in the particular action as such, whose progress is the subject of the epic narrative, but this action possesses the further stimulus to its opposed factors and their resolution,

and in fact is directed throughout its course and exclusively within a *national* and *collective whole*, or substantive content, which claims on its own account to assert a variety of characters, conditions, and events. In this respect the final consummation of the Epos does not merely consist in the particular content of the predominant action selected, but quite as much in the entire synthesis of the *general world-survey* whose objective reality it undertakes to depict; in fact, the epic unity is only then fully complete when the particular action, from one point of view no doubt, in its independent character, but also from another, regarded in its progression as the essentially rounded world within the sphere of which it moves, is placed before us as one indissoluble totality; and both of these spheres, or aspects of one sphere, repose together in the mediating fulness and unimpaired unity of very life.

Such, then, are the most essential characteristics we find it possible, within the limits accepted, to draw attention to in respect to the genuine Epos.

It is, however, possible to apply the same form of objectivity to other subject-matter, whose content does not carry with it the true significance of genuine objectivity. It is very possible that a theorist in Art will feel embarrassment when, with such modes of speech before him, he is asked to make a classification adapted to all poems without distinction; and we must not forget that under the generic term of poem these hybrid forms have also to be reckoned. In any really just classification, however, we ought only to include that which only conforms with a definition of the generic notion.[28] All that is, on the contrary, incomplete in content or form, or both, precisely for the reason that it is not as it ought to be, is only subsumed defectively under the notion, or in other words under the definition, which gives us the thing as it ought to be, and in truth actually is. I only propose, therefore, in

conclusion and by way of supplement, to add a few observations upon such subordinate and collateral branches of the true epic composition.

To this class of poetry above all the *idyll* belongs in the modern sense of that term, viz., that in which poetry stands aloof from the profounder interests of spiritual and ethical life, and depicts mankind in its innocence. Innocent life in this sense amounts to little more than an ignorance of everything except eating and drinking. We may add that what we eat and drink here is extremely simple, it is goat's milk merely, or sheep's milk, or at the most cow's milk, roots, acorns, vegetables, and cheese made from milk. I should say that bread is no longer in the truly idyllic sphere; we must, however, allow to it flesh-eating; for it is hardly possible that our idyllic shepherds and shepherdesses could have wished to sacrifice their herds exclusively to the gods. Their occupation will consist in looking the whole day long after their beloved herds with their faithful hound, in providing their food and drink, and along with this giving vent, with as much sentimental feeling as possible, to every kind of mood which does not disturb this condition of repose and contentment. In a word, they are satisfied with their peculiar piety and gentleness, piping away on their reed or oat-pipes, warbling to each other, and above all making love with the greatest tenderness and innocence.

The Greeks, on the contrary, possessed in their plastic representations a more jubilant world, with its attendants of Bacchus, Satyrs and Fauns, who, in their harmless service of a god, stimulated animal life and human joviality with a vivacity and truth totally different from the above pretentious innocence, piety, and emptiness. We may also recognize the same essentially animated outlook on the world as illustrated in lively pictures of national condition, in the Greek Bucolic poets such as Theocritus; this is so whether our poet lingers over actual situations of the life of fisher-folk, or shepherds, or extends the mode in which he expresses

this, or similar spheres of life, to a yet wider circle, either depicting such states in an epic form, or treating them in lyric form and that of the objective drama. Virgil already sings to us with less warmth in his Eclogues. Most tedious of all, however, is Gessner, so tedious that I suppose no one reads him nowadays. We can only wonder that the French ever had so much taste for him that they even ranked him highest among German poets. Their morbid sensibility on the one hand, which evades the tumult and changes of life, while yearning also for some kind of movement, and on the other the absence of all true interest in such poetry, so that the otherwise disturbing influences of our culture were not represented — both of these factors, no doubt, contributed to this preference.

We may reckon as a further class of this hybrid type of Epic those poems which are half description and half lyrics, a favourite type with the English, and one which for the most part accepts for its subject-matter Nature, the Seasons, and similar subjects. We may also associate with this type the various *didactic* poems concerned with physical science, astronomy, medicine, chess, fishing, and hunting — in short, the art which loves to elaborate in a poetic form what is really the content of prose, an art which has been cultivated with much talent in later Greek poetry, and after that by the Romans, and, in our time, pre-eminently by the French. Such poetry, despite its general epic temper, will very readily pass over into the lyric treatment.

The *romances* and *ballads*, which we find both in the Middle Ages and modern times, are no doubt poetry of a kind, though it is impossible to define accurately their type; so far as their content is concerned they are in part epic. If we look at the form of their composition, however, they are for the most part lyrical, so that we have perforce to reckon them from different points of view to different types.

The *romantic* novel, that Epopaea of *modern society*, opens a different field altogether. In this we possess, on the one hand, in all its completeness and variety, an epic prodigality of interests, conditions, characters, and living relations, the extensive background in fact of an entire world. We have also the epic exposition of events. What fails us here is the *primitive* world-condition as poetically conceived, which is the source of the genuine Epos. The romance or novel in the modern sense pre-supposes a basis of reality already organized in its *prosaic form*, upon which it then attempts, in its own sphere, so far as this is possible from such a general point of view, both in its treatment of the vital character of events and the life of individuals and their destiny, to make good once more the banished claims of poetical vision. For this reason one of the most common collisions in the novel, and one most suitable to it, is the conflict between the poetry of the heart and the prose of external conditions antagonistic to it, including with such the contingency such imply. This is a conflict which may be resolved on the lines of tragedy or comedy, or finds its settlement in the twofold conclusion, first, that the characters which in the first instance contend with the ordinary course of life are taught to recognize in it what is the genuine heart of things, becoming thereby reconciled to their conditions and ready to cooperate with them; and, secondly, that they learn how to brush away the purely prosaic aspect of all that they do and accomplish, and thereby replace the prose which they have found there with a reality allied and congenial to beauty and art. In so far as the form of the exposition is concerned, the genuine romance pre-supposes, precisely as the Epos does, the synthesized purvey of the world and life as one whole, the manifold contents of which are manifested within the reach of the individual event which supplies the focal centre of the entire complexus. In his attitude to detail, however, the poet must here permit himself a freer play both of conception and execution, and all the more so because he is here less able to

avoid the prose of actual life in his descriptions, though this freedom should not make him any more inclined to dwell exclusively in such an atmosphere of prose and ordinary occurrence.

3. THE HISTORICAL DEVELOPMENT OF EPIC POETRY

In looking back upon the course of our previous consideration of the other arts, we find that we reviewed the different stages of the art of *building* throughout in their historical development as successively in symbolic, classic, and romantic architecture. In the case of sculpture, on the contrary, we accepted the Greek type, by virtue of its complete identity with the notion of this *classic* art, as the real focal centre, from which we proceeded to develop the specific characteristics of importance, so that here we did not find it necessary to extend so far as in the previous case the range of our historical survey. This contrast is further illustrated in our treatment of the *romantic* art-character of painting, which, however,[29] not merely in respect to the fundamental notion of its content, but also in that of the mode of its presentation, embraces an equally wide and important range of development in different nations and through different schools, so that in this case it was necessary to make our reference to history more extensive and varied. The nature of the art of music invited us to historical comparisons of the same kind. Inasmuch, however, as I have neither obtained access to the foreign literature dealing with the history of this art, nor can claim personally to possess the adequate knowledge, I have been forced to restrict myself to the mere outlines of what is required incidentally. With regard to our immediate subject, that is, *epic* poetry, the course of our enquiry will be very much that followed in the case of sculpture. In other words, though the mode of exposition branches off in several direct or collateral divisions, and embraces many historical periods and peoples, yet we have already recognized in the Epos of Greek literature the genuine type of it in its

consummate form and most artistic mode of realization. And the reason of this is that in general the Epos possesses the closest affinity with the plastic of sculpture and its objective presence; and, not merely in respect to its substantive content, but equally so in the form of its presentation as that of phenomenal reality. It is therefore by no means simply an accident that we find epic poetry, no less than the art of sculpture, assert itself pre-eminently among the Greeks in its original and unsurpassed perfection. Stages of development, no doubt, are to be met with on either side of this culminating point, stages which are neither intrinsically subordinate or insignificant, but are necessary conditions of the art's growth, inasmuch as all nations are essentially within the sphere of poetic creation, and it is above all the Epos which brings before us the heart and core of the national life. And for this reason, the historical development of the Epic is of greater importance than was the case with sculpture.

We may then classify the entire compass of epic poetry, or, to express ourselves more accurately, of the Epopaea, in three fundamental stages; and these, speaking generally, constitute the course of the art's evolution.

Firsts we have the Oriental Epos, which makes the symbolic type its focal centre.

Secondly, there is the classical Epos of the Greeks, with its imitation in Roman authors.

Finally, we have the abundant and many-sided unfolding of epic-romantic poetry among Christian peoples; which, however, in the first instance appears in Teutonic paganism; and again, from another point of view, that is quite apart from what we may style the chivalrous poetry of the Middle Ages, we find the old classic world active in another province of life as instrumental to the purification of literary taste or style, or still more directly utilized as a model, until finally the modern romance replaces the Epos altogether.

We may now proceed to some review of single epic compositions: in this it will only be possible to emphasize what is of most importance; and, generally speaking, I can only pretend to give a rapid outline of this field in the space at my disposal.

(*a*) In the case of Oriental peoples the art of poetry is, as we have already observed, generally of a more primitive type, inasmuch as it remains more closely related to what we may style the essential[30] mode of envisagement, and the diffusion of the individual consciousness in the sublime Unity of the *One.* And because of this, as a further aspect, and relatively to the specific divisions of poetic composition, it is unable to work out individual personality in the self-subsistency of determinate characterization, with its aims and collisions, an elaboration which is of first importance in the composition of genuine dramatic poetry. The most essential result therefore we meet with here is limited — if we exclude from attention an endearing, sweet-scented, and delicate type of lyric, or one that uplifts itself to the one unutterable God — to poems, which are to be counted of the epic mould. Nevertheless it is only among the Hindoos and the Persians that we come across the genuine Epopaea; but here at least we do meet it in colossal proportions.

(*α*) The Chinese, on the contrary, possess no national Epos. The prosaic basis of their imaginative vision, which even to the earliest origins of history offers the jejune form of a prosaically organized historical reality, opposes from the first to this the most noble type of epic composition an insuperable obstruction. The religious conceptions of this people, little adapted as they are to artistic configuration, contribute to the same result. We find, however, at a later date and as some compensation, for their elaboration is most profuse, little narratives, and romances spun out to great length, which astound us by the vividness in which situations are realized, the accuracy with which private and public relations are depicted, the

variety, fine breeding, or rather I should say frequently the fascinating tenderness they display, more particularly in their female characters, and in short by the art in every respect which succeeds in making works so consummate.

(*β*) A world of great contrast to the above presents itself in the Hindoo Epopaea. We find already in the most primitive compositions, if we may form an opinion from the little made known to the general public up to the present time from the Veda, most fruitful germs for a mythology fitted to epic exposition; and these, associated with the heroic exploits of men many centuries before Christ — for chronological accuracy is still impossible — are elaborated into genuine Epopaea, works, however, which are still composed in part from the wholly religious point of view, and in part from that of unfettered poetry and art. Pre-eminently do the two most famous of these poems, namely the Ramajana and the Maha-Bharata, place before us the entire world-outlook of the Hindoo race in all its splendour and glory, its confusion, fantastical absurdity and dissolution, and withal, from the reverse point of view, in the exuberant loveliness and the here and there fine traits of heart and emotion, which characterize the profuse vegetation of its spiritual growth. Mythical exploits of men are expanded into the actions of incarnate gods, whose deed hovers vaguely between the divine and human nature, and the determinate outlines of personality and exploit are dissolved in an infinitude of extension. The substantive bases of the whole are of a type such as our Western world-outlook, assuming that it does not choose to surrender the higher claims of freedom and morality, is neither able to find itself truly at home in or to sympathize with. The unity of the particular parts is of an extremely unstable kind; and layers upon layers of episodical matter, consisting of tales of the gods, narratives of ascetic penances, and the powers they create, tediously long expositions of philosophical doctrines and systems, so entirely impair the collective unity that we are

forced to regard many of them as later accretions. But, however this may be, the spirit from which these stupendous poems have originated bears constant witness to an imagination, which is not only anterior to all prosaic culture, but as a rule is wholly incompatible with the faculty of ordinary common sense, and is capable in fact of endowing the fundamental tendencies of this national consciousness, in its essentially unique and collective conception of the universe, with an original artistic form. The later Epics, on the contrary, which are called *Puranas*, in the more restricted sense of the term, that is, poems of the Past, appear rather to be compiled in the prosaic and dull style similar to that adopted by post-Homeric cyclic poets, and pursue their downward course at great length from the creation of the gods and the universe to the genealogies of human heroes and princes. Finally the epic care of the old myths dissolves into vapour and artificial elegance of a purely external poetic form and diction, while on the one hand the phantasy, which exhausted itself in a dreamy wonderland, becomes the wisdom of fables whose most important function is to instruct us in morality and worldly wisdom.

(*γ*) We may compare side by side in a *third* division of epic Oriental poetry that respectively belonging to Hebrews, Arabs, and Persians.

(*αα*) The sublimity of the Jewish imagination no doubt in its conception of the Creation, in the histories of the Patriarchs, the wandering in the wilderness, *the* conquest of Canaan, and in the further historical course of national event, full as such a vision is of sterling content and natural truth, possesses many elements of primitive epic poetry; the religious interest is here, however, so predominant, that, instead of being genuine Epopaea, they merely approximate either to religious myths in the guise of poetry, or to religious narratives which are wholly didactic.

(*ββ*) The Arabs have always possessed a poetic nature, and from very early days we find genuine poets among them. Even their heroic songs of

lyric narrative, styled the moallakat, which in part originate in the century immediately previous to Mahomet, depict either with a few bold and detached strokes and vehement ostentation, or at other times with more tranquil self-possession, or a melting softness, the original conditions of the still pagan Arabs. Here we find the honour of the clan, the passion of revenge, the rights of hospitality, love, delight in adventure, benevolence, sorrow, and yearning, in undiminished strength, and in traits which remind us of the romantic character of Spanish chivalry. Here, too, we meet with in the East for the first time a real poetry, without fantastic elements, or prose, without mythology, without gods, demons, fairies, genii, and everything else of the kind common to the East, but rather with solid and self-sufficient characters and, however unique and marvellous in the play of its images and similes, yet for all that humanly real and self-contained. We have the vision of a similar pagan world also set before us by a later age in the collected poems of Hamasa, as also in the not yet edited "Divans of the Hudsilites." After the extensive and successful conquests of the Mohammedan Arabs this primitive heroic character gradually disappears; and, in the course of the centuries, the province of Epic poetry is replaced in part by the instructive fable and the witty proverb, in part by the fairy-like narratives, of which the "Thousand and One Nights" is an example, or in those tales of adventures which Rückert, through a translation which reproduces for us the equally witty and artistically elaborate Macamen of the Hariri in their metre, rhymes, and articulate meaning, has unveiled in a manner deserving thoughtful attention.

(*γγ*) In some contrast to this the efflorescence of Persian poetry falls in the period of that reconstructed culture effected by the change of language and nationality under the influence of Mohammedanism. We, however, come across, in the very first opening of this lonely springtime, an epic poem which, at least in its material, takes us back to the remotest Past of

ancient Persian saga and myth, and carries forward its narrative through the heroic age right down to the last days of the Sussanides. This comprehensive work is the Shahnameh of Firdusi, the son of the gardener of Tus, a work the origins of which are traceable to the Bastanameh.[31] We are, however, unable to call even this poem a genuine Epopaea, because it does not make any specific and individual line of action its focal centre. On account of the lapse of centuries we lose our hold of the costume appropriate to an age or a locality, and in particular the most ancient mythical figures and gloomy intricate traditions hover in a world of the phantasy, among the indefinite outlines of which we are often at a loss to know whether we are face to face with persons or entire clans; and then again we are often suddenly confronted with really historical characters. As a Mohammedan the poet was no doubt able to handle his subject-matter more freely; but it is just in this type of freedom that we fail to meet with the stability in definite characterization, as it was present in the design of the primitive heroic songs; and, on account of the great gulf which separates him from that long-buried world of saga, the freshness and breath of its immediate life vanish, though absolutely necessary to the national Epos.

In its further course the epic art of the Persians expands into Love-epopees of excessive softness and sweetness, as an author of which Risami is pre-eminently distinguished. It further makes use of its rich stores of life-experience in the interest of the teacher. In this sphere the far-travelled Saadi was master. Finally, it plunges into that pantheistic Mysticism, which Dschelaleddin Rumi recommends and teaches in tales and legendary narrative.

I must, I fear, restrict myself to the above sketch.

(*b*) In the poetry of *Greece* and *Rome* we find ourselves for the first time in the genuine sphere of epic art.

(*α*) Among these above all are included of course the *Homeric* poems, which we have already noted as the culminating point of all.

(*αα*) Either of these poems, despite all that may be advanced to the contrary, is essentially self-complete, so definite and sensitive to its construction as a whole, that in my own opinion the very view which regards the present form of both as merely that in which they were sung and handed down to posterity by rhapsodists, simply amounts to little more than the just eulogy of such works in virtue of the fact that they are, with regard to the entire atmosphere of their content, national and realistic, and even in their particular parts are so consummately finished, that all and each of them may be taken as a whole in itself. Whereas in the East what is substantive[32] and universal in the poet's survey still impairs the individuality of character, and its aims and exploits by its symbolism or deliberate instruction, and thereby injures the definite articulation and unity of the whole. Here for the first time in these poems[33]we find a world beautifully suspended as it were between the general life-conditions of morality in family, state and religious belief, and the individuality of distinctive character, and in this fair balance between the claims of spirit and Nature, intentional action and objective event, between a national basis of enterprise and particular aims and deeds, even though individual heroes appear as the predominant feature in their free and animated movement, yet this too is so mediated by the distinctiveness of the aims proposed and the severe presence of destiny, that the entire exposition can only remain even for ourselves the *ne plus ultra* of all attainment that we can either enjoy or admire in epic composition. For we find no difficulty here in recognizing the real significance of even the gods who withstand or assist these primitive masculine heroes in their bravery, their straightforward and noble actions: nor can we fail to return the merry smiles of an art which depicts

them as we see them here in all the *naïveté* of their very human, if also godlike impersonations.

(*ββ*) The *cyclic* poets of an age subsequent to the Homeric poems depart more and more from this genuine type of epic poetry. On the one hand the tendency here is to break up the completeness of the national world-survey into its petty provinces and aspects; and from another point of view, instead of retaining a firm grasp of the poetic unity and distinctive character of an individual action, to insist more exclusively on the completeness of events as an historical series, or on the unity of the personality, and by so doing to assimilate epic poetry with the already emphasized historical impulse of the logographers in their historical compilations.

(*γγ*) Finally Epic poetry of a still later date after the time of Alexander either turns aside to the more limited province of bucolic poetry, or introduces more learning and artifice than is compatible with the truly poetic Epopaea being at last wholly didactic, a type which increasingly suffers to escape every vestige of the primitive freshness, simplicity and animation.

(*β*) This characteristic, with which the Epos of the Greeks terminates, is from the first predominant among the *Romans.* An epic Bible, such as are the Homeric poems, we shall therefore seek for here in vain, however much critics have attempted, even quite recently, to resolve the most ancient Roman history into national Epopaea. On the other hand, even from the earliest times, along with genuine epic art, of which our finest extant example here is the Æneid, the historical Epos and the didactic poem supplies us with a proof that it is the Romans who are mainly responsible for the elaboration of that province of poetry which is already half prose; just as also it was in their hands that the *satire* received its most perfect form, being also that most congenial to their character.

(*c*) For this reason epic poetry could only be infused with a fresh breath and spirit through a change in its outlook on the world and in its religious belief, and through the actions and destinies of new nationalities. This is what we have in the case of the *Germans*, not only as we see them in their primitive paganism, but also after their conversion to Christianity. It may be further illustrated by the Romance nations and all the more strongly, in proportion as their subdivision into groups is more complete, and the principle of the Christian view of life and reality is unfolded in all its various phases. Yet it is precisely this many-sided expansion and subdivision which oppose to a brief survey great difficulties. I will consequently only draw attention to and emphasize fundamental tendencies.

(*α*) In our *first* group we may reckon the residue of genuine poetry, which later nationalities have still retained from an age previous to Christianity, for the most part by means of oral tradition, and consequently not wholly unimpaired.

We may include above all among these the poems which are usually ascribed to *Ossian.* Although English critics of repute, such as Johnson and Shaw, have been blind enough to publish them as the sole composition of Macpherson, it is none the less wholly impossible that a poet of our own time could create from his own resources alone such ancient social conditions and events; consequently we must presuppose here previous poems as the foundation of such a work, although too in their entire atmosphere, and the mode of conception and feeling expressed in them, many changes more in accord with our modern life may have been introduced in the course of so many centuries. It is true their actual date is not established; they may, however, very well have retained a vital form in the mouth of the folk for one thousand or even fifteen hundred years. Taking them as a whole their form appears to be predominantly lyric. Ossian is here presented as the old minstrel and hero, who has lost his sight,

and suffers in a retrospect of lament, the days of glory to rise before him. Yet although his songs originate in woe and mourning they nevertheless are in themselves fundamentally epic; for even these lamentations refer to what has been, and depict this world which has now just vanished, with its heroes, its love-adventurers, its exploits, its expeditions aver sea and land, its chance of arms, its destiny and its downfall, in just the same epic and realistic way — although broken here and there with lyrics — as we find in Homer the heroes Achilles, Odysseus, or Diomede, talking of their exploits, expeditions, and mischances. Yet the development of spiritual emotion, and indeed of the entire national existence, despite the fact that here heart and sentiment have a more exacting rôle to play, is not carried so far as in Homer's case. Most of all we miss the assured plastic form of his characterization and the daylight clarity of his presentment. We are, in short, so far as *locale* is concerned, exiled in the tempestuous mists of the North, with its gloomy sky and heavy clouds, upon which the spirits ride or appear to heroes, raimented in their form. We may add that it is only quite recently that other Gaelic minstrels of olden time have been discovered, rather connected, so Wallis informs us, with England than Scotland or Ireland, minstrelsy having been for a long time continuous in that country, which already must have possessed a considerable literature.

In these poems we have among other things reference to emigrations to America. Mention is also made of Caesar; but the reason here given for his invasion is a private passion for some king's daughter, whom he saw in Gaul and followed to England. As a striking characteristic of their form triads are worthy of attention, which combine in three organic parts three events of similar character, though dating from different periods of time.

Finally, and more famous than these poems, are on the one hand the heroic songs of the more ancient Edda, and on the other the myths with which for the first time in this cycle of song along with the narrative of

human destinies we also come across various histories concerning the origin, exploits, and downfall of the gods. I must, however, confess I have been unable to acquire a taste for the empty exuberance of these origins of a natural philosophy of symbolism, which, however, are further attached to the appearance of particular human form and physiognomy, such as Thor with his hammer, the Werewolf, the wild mead-carousals, and in a word, the savagery and troubled confusion of such a mythology. We must admit, of course, that all that intimately concerns this folk of the North lies nearer to ourselves than, say, the poetry of the Persians and Mohammedanism; but to press upon the educated man among us such an admission to the point that it has still at this time of day a claim upon his sympathy, and indeed ought to pass for us as something national — such an assumption, though often ventured, means not merely to overrate conceptions, which are to a great extent misshapen and barbarous, but also to wholly misunderstand the significance and spirit of our own times.

(β) If we, *secondly*, cast a glance over the poetry of the Christian Middle Ages, what we ought in the first instance and above all to consider are those works which have, without more direct and penetrating influence of the old literature and culture, sprung up from the fresh spirit of the Middle Ages and consolidated Catholicism. Here we find the most multifold elements ready to supply the material and stimulus of epic poetry.

($\alpha\alpha$) We may in the *first* place draw retention to that truly epic subject-matter which comprises in its content interests, exploits, and characters of the period mentioned of a wholly *national* character. Among these the Cid is pre-eminently worthy of our notice. The significance of this blossom of national heroism in the Middle Ages to the Spanish, this is set before us in epic guise in the poem Cid, and then at a later date with more attractive excellence in a succession of narrative romances, which Herder first brought to the notice of Germany. We have here a string of pearls, every

single picture entirely complete in itself, and yet all so admirably in tune with each other that they make a consistent whole; though throughout composed in the spirit of chivalry, yet at the same time Spanish and national; eminently rich in the content of their varied interests, whether these concern love, marriage, honour, or the mastery of kings in wars waged between Christians and Moors. All this material is voiced in so epic and plastic a style, we have set before us the pertinent fact so simply in the purity of its exalted content, and withal with such a wealth of the noblest pictures of human life displayed in a panorama of the most glorious exploit, and all this bound together in a wreath so fair and fascinating, that we moderns may compare it with the most beautiful creations of the ancient world.[34]

As a matter of fact it is as impossible to compare the Nibelungenlied, as it is the Iliad and Odyssey, with this world of romance, which, however dissevered in fragments it maybe, is none the less epic in its fundamental type. For although in the former precious and truly German work we have no lack of a national and substantive content, in respect to family, matrimonial affection, duty of vassalage, loyalty of service, heroism, and, in a word, genuine marrow and substance, yet the entire collision, despite all its epic breadth of vision, is rather one of a dramatic type, than truly epic, and the exposition, with all its detail, neither tends towards the individualization of its abundance, nor to a presentment that is wholly lifelike; and from a further point of view it is frequently squandered in pure harshness, savagery and ferocity, so that the characters, although we find them compactly braced and robust in action, yet in their abstract ruggedness rather resemble coarse images of wood, than are comparable to the humanely evolved, genial individuality of the Homeric heroes and women.

(*ββ*) A second fundamental source of such literature is to be traced in the religious poems of the Middle Ages, which take as their subject the life of

Christ, or those of the Madonna, the Apostles, the saints and martyrs and the Last Judgment. The most essentially complete and rich composition, however, the genuine art-Epic of Catholic Christianity in the Middle Ages, the greatest subject-matter and the greatest poem is in this sphere Dante's Divine Comedy. It is true that we cannot call even this severely, rather I should systematically organized poem, an Epopaea in the ordinary sense of the term. For we have not here one progressive action, individual and exclusive, on the broad basis of the entire poem: what, however, we do get in a conspicuous degree in this Epos is the most secure articulation and consummate finish. Instead of a particular event it has for its subject-matter the eternal event, the absolute end, the Divine Love in its imperishable eventuality, and in its unalterable circles' of relation to the object. Possessing further Hell, Purgatory, and Paradise for its locality, it plunges the living world of human action and suffering or, more closely, that of individual acts and destinies in this changeless existence. Everything single and particular in human interests and aims here vanishes before the absolute greatness of the purpose and end of all things; at the same time, however, what is otherwise most perishable and evanescent in the living world receives here a completely epic form objectively based on its own innermost life, and adjudged in its worth and unworth by the supreme notion of all, that is God. For as individuals were in their life and suffering, their opinions and accomplishment on Earth, so are they here set before us for ever consolidated, as it were, into images of bronze. It is in this way that the poem embraces the totality of the most objective life, that is, the eternal condition of Hell, of Purification, and of Paradise; and it is on these indestructible foundations that the characters of the actual world move in their particular personalities, or rather they *have* already moved, and are henceforward rendered moveless, together with their action and being, in the everlasting righteousness, and are themselves eternal. The Homeric

heroes indeed endure in *our* memories through the song of the Muse. These characters assert their condition on their own account, and in the cause of their own individuality: they do not so much exist in our imagination; they are *themselves* essentially eternal. The perpetuation through the Mnemosyne of the poet has here the objective force of the very judgments of God, in whose Name the most dauntless spirit of his time has damned or beatified the entire present and past.

The exposition also must perforce follow the above character of an object, which is received rather than given. It can only be a wandering through a world that is for ever determined; which, although it is discovered, organized, and peopled with the freedom of the imagination wherewith Hesiod and Homer created their gods, nevertheless undertakes to give us a picture and a report of what has actually happened, an account full of energetic movement, yet plastic in the rigidity of its pains; rich in the flashes of its horror, yet mitigated pitifully in Hell through Dante's own sympathy; more gracious in purgatory, but none the less fully and completely elaborated; and, finally, translucent as light in Paradise, and for ever without materia form in the eternal ether of thought.

The ancient world no doubt peers into this world of the Catholic poet, but only as the guiding star and companion of human wisdom and culture; for, where it is a question of doctrine and dogma, it is the scholasticism of Christian theology and love which speaks.

(*γγ*) A *third* fundamental subject-matter, which arrests the interest of the poetry of the Middle Ages, is that of *chivalry.* This interest is not merely limited to its worldly and romantic association with love-adventure and tilting matches, but is occupied with religious objects in virtue of the mysticism of Christian knighthood. The actions and events of such compositions have no relation to national interests; they are matters effected by individuals, which only concern the personal agent as such; they are

generally similar to what I have described in my previous reference to romantic chivalry. Individuals are consequently placed in a position of complete freedom and independence. A novel form of heroism is thereby created within a social environment that is not as yet stereotyped to the prosaic mode and temper; a heroism, however, which, on account of interests which in part are due to religious phantasy, and in part — that is from the worldly point of view — are wholly personal and imaginary, eschews that substantive Real, upon the basis of which the Greek heroes are united, or as units contend, are victorious or are vanquished. Despite all the varied epic compositions, which such a course as the above occasions, the adventurous character of the situations, conflicts and plots rather tends, on the one hand, in the direction of a treatment usually met with in romances, where the various examples of adventure are loosely interwoven in no more stringent bond of unity, and on the other to that which, while sharing the general features of such works, is not evolved on the background of a consistently organized civic order and a truly prosaic condition of general life. Moreover the imagination is not content with the mere invention of knightly characters and adventures outside the pale of the ordinary world of things; it furthermore associates the exploits of the same with important legendary centres of interest, pre-eminent historical personages, decisive conflicts of the age, and receives by doing so, if we view its broader lines, at least a foundation such as we found indispensable to epic creation. Such a basis, however, we shall find is as a rule commingled with fantastic elements, and is unable to secure the clarity of objective vision in its elaboration, which above all distinguishes the Homeric Epos. Add to this the fact that on account of the very similar treatment accorded to the same subject-matter by Frenchmen, Englishmen, Germans, and to some extent even Spaniards, we fail to find here relatively at least, and if we contrast it with that of the Hindoo, Persian, Greek, and Celt, the essentially national

temper, which in the last-mentioned cases constitutes in its security the epic core of the content and its execution. I must, however, excuse myself here from entering further into the detail of this aspect, either by way of illustration or critical judgment. It will be sufficient if I merely draw attention to the larger circle, within which the most important of these Epopaea of knight-errantry are to be met with if we estimate them relatively to their subject-matter.

As a *leading* figure in this respect we have first Charles the Great with his peers in the conflict fought against Saracens and pagans. In this Frankish circle of legend feudal chivalry forms a background of prime importance, and branches off into poems of every description, whose most significant material is concerned with the exploits of one of the twelve heroes, such as Roland or Doolin, of Maintz and others. More particularly in France during the reign of Philip Augustus many of such Epopees were composed. We have a *further* garland of legend with an English source, one which aims at reproducing the exploits of King Arthur and the Round Table. Legendary tale, the chivalry of Normans and Englishmen, service to woman, the fealty of the vassal, are all here involved together in melancholy or fantastic combination with Christian mysticism. The search for the Holy Grail, that chalice containing the sacred blood of Christ, is, indeed, one main object of all knightly exploit, and every description of fantastic adventure originates in this source, until, finally, the entire company takes flight to Abyssinia. The above two subjects of legendary story are worked out with most completeness in Northern France, England, and Germany. And as a last illustration we have a *third* circle of chivalrous poetry, composed with yet more caprice and less substantive content, which ever tends to emphasize knightly heroism to an excess with ideas of fairyland and fable; this rather points to Portugal or Spain as its original nursery. In this the family of the Amadi are accepted as principal heroes.

The great allegorical poems, so much beloved mainly in Northern France in the thirteenth century, are more nearly prose compositions in their abstract type. I will only mention one example of these, that is, the famous *Roman de la Rose.* We may compare or rather contrast such with the many anecdotes and still lengthier narratives, the so-called *fabliaux* and *contes*, which rather borrow their subject-matter from contemporary life, tales of knights, priests, citizens, and above all *amours*, lawful and the reverse, retailed to us sometimes in the comic vein, at others in the tragic, now in prose, and again in verse. Such was the type of writing which the clear intellect and trained culture of a Boccaccio carried to its perfection.

There is a final class of such compositions, which, turning to the ancients — with a casual knowledge of the Epic of Homer and Virgil, or ancient legend, celebrates also, in precisely the manner of the Epopaea of chivalry, the exploits of Trojan heroes, the foundation of Rome by Æneas, the conquests of Alexander, and other like subjects.

And this will conclude what I have to say upon the Epic poetry of the Middle Ages.

(*γ*) In a *third* principal group of which I have still to speak, the rich and pregnant study of *ancient* literature marks a point of departure for the purer artistic taste of a new culture, in whose learning, assimilation, and blending of diverse elements, however, we frequently miss that primitive creative power, which we admire in the Hindoos, Arabs, as also in Homer and writers of the Middle Ages. In the many-sided development in which, dating from this age of the re-awakened sciences and their influence on national literatures, the actual conditions of mankind undergo a reform in religion, political condition, morals, and social relations, epic poetry also seizes hold of the most varied content, as also the most manifold forms, the historical course of which I can only direct attention to in its most essential characteristics.

(*αα*) *First,* we may remark that it is still the *Middle Ages*, which now, as previously, supplies the material for the Epos, although the same is conceived and presented in a new spirit, namely, one permeated with the culture of classic literature> We find here pre-eminently two directions in which the art of epic poetry displays itself.

On the one side the awakening consciousness of the age shows a necessary tendency to treat as ridiculous all that is capricious in the adventurous feats of the Middle Ages, all that is fantastic and exaggerated in chivalry, all that is merely formal in the independence and personal isolation of the heroes, and which is now contained within a social reality embracing more abundance of national conditions and interest; a consciousness which further brings this entire world before our vision in the light of comedy, which does this, however much what is really genuine within it is also asserted, with seriousness and delight. As the culminating points of this genial conception of the entire world of chivalry I have already pointed to Ariosto and Cervantes. I will therefore in the present passage merely draw attention to the brilliant facility, the charm and wit, the loveliness and intense ingenuousness, with which Ariosto, whose poem still hovers among the poetic aims of the Middle Ages, merely in a more veiled and humorous fashion makes what is fantastic vanish away by means of the incredibility of his nonsense, while the profounder romance of Cervantes already assumes knight-errantry to be a Past behind it; which, consequently, can only enter into the real prose and presence of life as vanity in its isolation and fantastic folly; yet at the same time it gives equal prominence to its great and noble aspects in their contrast to what is awkward, stupid, devoid of reason and order in this very prosaic reality, making the defects of the same live before our eyes.

Among writers who have contributed to a *second* phase in this type of epic development I will merely mention the representative name of Tasso.

In his “Jerusalem Delivered” this poet, in contrast to the poetry of Ariosto, selects for his central theme, without any admixture of the humorist’s temper whatever, the great and common aims of Christian chivalry, the recovery of the Holy Sepulchre, the victorious pilgrimage of the Crusades, and, after the model of Homer and Virgil, creates an Epos with enthusiasm and study, which may even be compared with the great prototypes abovementioned. And no doubt we do discover in this work, quite apart from a genuine, and, in part, too, national and religious interest, a type of unity, development, and elaboration of the whole such as we have previously fixed as a primary condition. We may add to this a fascinating music in the verse, which makes the same still harmonious to living speech. What, however, is pre-eminently wanting in this poem is just that kind of primitive origin which is alone able to create the real Bible of an entire nation. In other words, instead of having, as in Homer’s case, a work which, as true Epos, expresses once for all in language, and with direct simplicity, that which the nation is through its actions, the epic in question rather appears simply a poem, that is, a poetically constructed event. We are mainly pleased and satisfied with it in virtue of the artistic effect of its beautiful speech and form, whether we consider its more lyrical aspects, or its epic descriptions. Consequently, however much Tasso may have taken Homer for his model in the collective arrangement of his material, in the entire spirit of the conception and presentation it is rather and in chief the influence of Virgil that we actually discover in the work, and of course do so not to the poem’s advantage.

Finally, among the great Epopaea, which are constructed upon the basis of a classic culture, we must include the “Lysiad” of Camoens. In the subject-matter of this entirely national composition, which celebrates the bold sea-faring of the Portuguese, we are already beyond the true Middle Ages, and have interests unfolded, which inaugurate a new era. But here,

too, despite the glow of its patriotism, despite the life-like character of the descriptive matter, based for the most part upon the author’s own experience, we are still conscious of a real barrier between the subject that is national and an artistic culture which is partly borrowed from the ancients and in part from the Italians, and which impairs its impression as a truly original epic.

(*ββ*) The essentially new manifestations in the religious belief and actual composition of modern life originate in the principle of the Reformation. The whole tendency of this general change of outlook is, indeed, rather favourable to lyric and dramatic, than epic poetry. But we do find nevertheless, even in the latter sphere, an autumnal blossoming of the religious Epopaea, of which the pre-eminent examples are Milton's "Paradise Lost" and Klopstock's "Messias." In breadth of culture, gained through study of the ancients, and the correct elegance of his language, Milton is no doubt an admirable master of his age. In the profundity of his content, in energy, original invention and execution, and, above all, in the epic objectivity of his presentment, however, he is in every respect inferior to Dante. For not only does the conflict and the catastrophe of "Paradise Lost" take a direction which is contrary to its dramatic character; but, as I have above incidentally observed, it is, in a unique way, supported by a lyrical impulse and ethical or didactic predilections, which lie far enough away from the subject in its original form.[35] I have already, in discussing Klopstock, referred to a similar cleft between the material and the form, which a particular age gives to it in its epic reflection. In the case of Klopstock, moreover, an endeavour is throughout apparent through a rhetoric, which is little more than the caricature of the Sublime, to infuse the reader with that recognition of the worth and solemnity of his subject, which the poet has himself experienced. From a somewhat different point of view we arrive at very much the same conclusion in the case of Voltaire's "Henriade." At any rate here too the poetry is an artificial production, and all the more so, inasmuch as the material, as already observed, is not adapted to the truly primitive Epos.

(*γγ*) If we try to discover really epic compositions in our own day we shall find ourselves in an atmosphere totally different from that of the genuine Epopaea. The general condition of the world to-day has assumed a

form, which, in its prosaic character, is diametrically opposed to everything which we found indispensable to the genuine Epos, while the revolutions, which have been imposed upon the actual social conditions of states and nations, are still too strongly riveted in our memory as actual experiences that they should be able to receive an epic type of art. Epic poetry has consequently taken refuge from the great national events in the narrow circle of the domestic life of individuals in the country and in the small town, striving to find here the material adapted to epic composition. In this way, more particularly among us Germans, the Epic has become idyllic, after the genuine Idyll, of the sweet sentimentality and wishy-washy type, died out.

As an example lying close to hand of an idyllic Epos I will merely mention the "Luise" of Voss, as also and above all Goethe's masterpiece, "Herman and Dorothea." In the latter work we have no doubt our attention directed to the background of the greatest world-event of our age, with which the circumstances of the innkeeper and his family, of the pastor and the apothecary, are directly associated. And inasmuch as the little country town is not placed before us in its political relations we at once remark a gap in the narrative which is not explained or mediated by any connecting link. Yet it is precisely through this omission of the intermediate link that the whole keeps its unique character. For with the stroke of a master Goethe has removed the revolution into the background, despite the fact that he has known how to make the most happy use of it in the enlargement of his poem. He only interweaves such circumstances with the action as, in their simple humanity, connect themselves absolutely without constraint with domestic and civic conditions. The main point, therefore, is that Goethe in this work has succeeded in detaching from the reality of our modern life traits, descriptions, conditions, and developments, and depicting the same, which in their province once more make that alive which contributes to the

imperishable charm of those primitive human conditions of the Odyssey and the patriarchal picture of the Old Testament.

In respect to other spheres of our present national and social life I would observe in conclusion that in the field of epic poetry there are practically unlimited opportunities for the *romance*, the *narrative*, and the *novel.* I am, however, unable, even in the most general outline, to follow the history of these in the breadth of their development from their first appearance until the present time.

[1] *Die echt poetische Abrundung.* Not, however, merely literary finish, but complete ideal totality.

[2] *Einem bestimmten Tone*. Perhaps more truly "a particular strain or atmosphere." But both aspects are suggested.

[3] There is a misprint here *eine recht* for *einer echt*, and also I should prefer eight lines lower down *die* for *das* agreeing with *Freiheit* rather than *Leben.*

[4] This sentence is obviously ironical, but the sense intended is not very clear. The words *die sic* are clearly a misprint for *die sick,* and I presume *kindisch* is not used in its more common depreciatory sense of childish. I am, however, not very confident of my translation. *War es ein Zeichen* would apparently refer back to the general intention of the previous sentence, *i.e.,* the attempt of Klopstock and others to make a national book.

[5] See vol. I, pp. 240-289, and particularly pp. 270-289.

[6] *Eine Sittlichkeit.*

[7] Poet., c. 14.

[8] That is to say, that the whole remains intact in its opposition. The question of international ethics is not directly considered, though reference is here made to historical evolution in its widest sense.

[9] Wrong that is inflicted on a state which is, as a whole, innocent.

[10] I presume the reference is mainly to the United States. Hegel's sentence is *so möchten diese nur den Sieg dereinstiger Americanischer lebendiger Vernünftigkeit über die Einkerkerung in ein ins Unendliche fortgehendes Messen und Particularisiren darzustellen haben.* It may be doubted, perhaps, whether he would have expressed himself with equal confidence in our own day. At least the position of the German States of his own time no doubt was strongly present in his mind.

[11] *Von einem anderen beschränkt.* Curtailed, I imagine, as a spontaneous and free power.

[12] That is acting in subservience to eternal forces, not directing those forces. Hegel conceives the event as supplying the lines of direction through which the forces are effective.

[13] *Aus der Dumpfheit des Bewusstseyns.* Out of the confusions of consciousness.

[14] I have adopted the masculine gender in accordance with the text, though of course it does not imply personality in the ordinary sense.

[15] I suppose the meaning is that it is a purely objective panorama.

[16] *Seiner Sache,* Somewhat vague and difficult to translate. It means more than his affair or business.

[17] *Trauer.* Mournfulness or gloom is perhaps better.

[18] Liv., ii, c. 32.

[19] Lit., so far as they do not emphasize essential phases in (*Momente*).

[20] I presume the allusion is to the way, already illustrated, the Homeric gods do not take themselves seriously.

[21] Messias, Canto II, w, 627-850.

[22] It is possible Hegel means by *geistige* intelligible.

[23] Act II, sc. 6.

[24] "O, that I had never shipped hither over the sea, unhappy that I am! Vain was the fancy which befooled me to seek an empty fame in France;

and now a fatal destiny carries me to this bloody field of death. O that I were far from here housed at home on the banks of the blue Severn, where the mother remained behind and the gentle sweet bride mourning for me."

[25] "To Death thou art decreed! A British matron it was that conceived thee!"

[26] "With vow to slay at everything alive with the sword that the fateful god of battles confronts her with."

[27] *Sitte und Settlichkeit.*

[28] That is of the Epos.

[29] The course of painting is similar to that of sculpture in virtue of the fact that it is wholly of one type, viz., romantic, but it differs from it in being less objective and requiring more historical illustration.

[30] *Substantiellen*, *i.e.,* an outlook which concentrates attention on the one Divine substance, the essence beneath the phenomenal.

[31] I presume this is another Persian composition, but it may be a cult of some kind.

[32] Substantive as contrasted with phenomenal.

[33] That is the Iliad and Odyssey.

[34] What Hegel means to say by this and the following paragraph is by no means clear. He first seems to state as a fact that a rivalry may be asserted, or at least has been asserted by others, between the Spanish romances and the finest Greek and Latin epic literature, and then immediately afterwards denies the fact so far as the Iliad and Odyssey is concerned. The confusion and indeed uncertainty seems to be due to the fact that while explaining the disadvantage in which the German work is placed as compared with the Spanish romances, he merely contrasts the Homeric poems with the former. What he apparently means us to infer is that the latter are as superior as the German work is, at least as an Epos, inferior. The words "we moderns" are apparently ironical. In any case the entire passage is, I think, clearly one

which needed revision, and it is possible that the two paragraphs have been tacked together by Hegel's editors from different connections.

[35] As we find it, presumably, in Genesis.

(B.) LYRIC POETRY

The poetic imagination does not, as the plastic arts do, present the objects of its creation before our vision in an objective shape, but only envisages them to the inward vision and emotions. No doubt from the first, relatively to certain aspects of this universal type of composition, it is the *personal* quality of ideal creation and construction which pre-eminently asserts itself in the presented work, and as such is to be contrasted with plastic construction. But when epic poetry offers to our contemplation its object either in its substantive universality, or under a mode comparable with that of sculptor and painter — in other words, in its living presence — in that case, at least where the art is most consummate, the individual mind and soul of the creator involved in the creation disappears before the objective result created. The above personal or subjective aspect of mind can only completely be discarded in so far as, in the first place, the entire world of objects and relations are essentially absorbed by it and then permitted to stand forth freely from the veiled presence of the individual consciousness, and, further, in so far as the self-centred soul unbars its doors, opens wide its ears and eyes, extends the purely unenlightened feeling to vision and idea, and attaches to this wealth of hidden content word and speech as the vehicle of its intimate self-expression. And just in proportion as this kind of communication persists in shutting itself away from the objective manifestation of epic art, to that extent, and precisely for that reason, the subjective type of poetry is bound to find its own forms, in a province of its

own, wholly independent of the Epos. In other words, the human spirit descends from the objectivity of the object into its own private domain; it peers into its particular conscious life; it endeavours to satisfy the desire to reproduce the presence and reality of *that*, as displayed in soul, in the experience of heart and reflected idea, and in doing so to unfold the content and activity of the personal life rather than the actual presence of the external fact. But, again, inasmuch as this expression, if it is not simply to remain the chance expression of mere individuality[1] in its immediate feeling and conception, must assert itself in speech as the reflection of an inner life that is *poetic*, all that is thus envisaged of feeling or otherwise — and however much, too, it may be a part of the poet's unique personality, and be presented by him as such — must nevertheless possess a universal validity, in other words, it must essentially include feelings and reflections for which the art of poetry is able to discover the vital and adequate means of expression. And although, apart from this, pain and desire, as conceived, described, and expressed in speech, may lighten the heart, and poetic ebullition is unquestionably permissible for such a purpose, yet its function is not restricted to such domestic service. Rather it has a nobler vocation, which is not so much to liberate the human spirit from emotion, but in the medium of the same. The blind tumult of passion surges on in a union with the entire soul-life unenlightened, unawakened to the grasp of mind. In such a state the soul cannot assert itself in idea and expression. It is the function of poetry no doubt to free the heart from such a prison house, in so far as it presents that life as an object to it. But it does more than this mere translation of content from the immediacy of emotional experience; it creates therefrom an object which is purified from all mere contingency of the passing mood; an object in which the soul-life in this deliverance returns once more to itself freely and with self-conscious satisfaction, and remains there at home. Conversely, however, this primary objectivisation ought not

to be carried to the point of a reflection that actually discloses the individual activity of the soul-life and its passions as it is carried forward in practical impulse and *action*; in other words, in the self-return of the individual upon himself in veritable deed. For the most pertinent reality of our inner life is still itself an inward something, and consequently this passage from itself can only give us the *sense* of deliverance from the immediate concentration of heart in its blind and formless presence, which now unbars itself in self-expression, and in doing so grasps and expresses what was previously merely felt in the form of a self-conscious vision and ideas. And with these remarks I think we have determined in their essential features both the sphere and function of lyric poetry as contrasted with the epic and dramatic types.

As regards the more detailed examination and classification of our new subject-matter, we cannot do better than follow the course previously adopted in our examination of epic poetry.

First, we have to discuss the *general* character of lyric composition.

Secondly, we shall consider the *particular* characteristics which make the lyric work of art and the types of the same worthy of attention in their more direct relation to the lyric poet.

Thirdly, we shall conclude the survey with a few remarks upon the *historical* development of this class of poetic work.

Generally I may remark that this survey will be extremely restricted, and for two reasons — first, because I am compelled to reserve the necessary space for the discussion of the dramatic field; secondly, because I must limit myself exclusively to general considerations, inasmuch as the detail embraced by it possesses far more incalculable resources of manifold complexity than in the case of the Epos, and could only be treated in greater fulness and completeness if viewed historically, which is not within the aim of the present work.

1. GENERAL CHARACTER OF THE LYRIC.

In the stimulus of epic poetry is the desire to hear the thing or matter which is unfolded on its own account, and independently of the poet,[2] as an objective and essentially exclusive totality. In the lyric, on the contrary, it is the converse need which finds its satisfaction in self-expression and the coming to a knowledge of the soul in this expression of itself. With regard to the nature of this effusion,[3] we may enumerate its most important constituents as follows:

First, there is the *content* in which soul-life is aware of itself and reflects itself in idea.

Secondly, there is the *form,* in virtue of which the expression of this content becomes lyric poetry.

Thirdly, there is the stage of conscious life and culture from which the person thus lyrically viewed discloses his feelings and ideas.

(*a*) The content of the lyric work of art cannot comprise the development of an objective action in its possibilities of expansion into all the breadth and wealth of a world. It is the single person, and along with him the isolated fact of situation and objects, no less than the mode and manner in which the soul is made aware of itself in such content, with its private judgments, its joy, its wonder, its pain, and its feeling, which it presents to our vision. Through this principle of division and particularity, as present in the Lyric, the content may be of the greatest variety, associated with every tendency of national life. There is, however, this essential distinction, that whereas the Epos combines in one and the same work the spirit of a people in all its breadth, and in its actual deed and fashion, the more definite content of lyrical poetry limits itself to one particular aspect, or at least is unable successfully to attain to the explicit completeness and exposition which the Epos ought at least to possess. The entire wealth of lyrical poetry in a nation may, therefore, no doubt embrace the collective exuberance of

national interest, idea, and purpose; but it is not the single lyrical poem that can do this.

The Lyric is not called upon to produce Bibles such as we have discovered in Epic poetry. It does, however, enjoy the advantage of being able to touch upon every conceivable aspect of national development; whereas the true Epos is limited to distinct epochs of a primitive age, and its success in our more recent times of prosaic culture is very jejune.

(α) Within this field of particularization we have, to start with, the *universal* as such — the supreme height and depth of human belief, imagination, and knowledge — the essential content of religion, art, ay, even of scientific thought, in so far as the same is adaptable to the form of imagination and creation, and can enter the sphere of emotions. Consequently general opinions, what is of permanent substance in a view of the world, the profounder grasp of far-reaching social conditions are all not excluded from the Lyric; and a considerable part of the material I have referred to[4] when discussing the more incomplete types of the Epic falls rightly, and with pertinency into the sphere now under review.

(β) And along with such essentially universal topics we have associated the aspect of *particularity*, which can be so interwoven with what is thus substantive that any specific situation, feeling, or idea is thereby seized in its profounder significance and expressed in a way wholly accordant thereto. This is, for example, almost always the case in Schiller's lyrical work, as also in his ballads; in this connection I will merely recall the superb description of the Eumenides chorus in the Cranes of Ibicus, which is neither dramatic nor epic, but lyrical. From a further point of view we may have this combination so asserted that a variety of particular traits, moods, occurrences are introduced by way of testimony to comprehensive views and maxims, interlaced in vital coalescence by virtue of the general

principle. This style of writing is frequently employed in the elegy and epistle, and generally in reflections upon life of a comprehensive character.

(*γ*) In conclusion, inasmuch as in lyrical composition what is self-expressed is the *individual person*, a content, which is extremely slight, will primarily suffice for this purpose. It is, in other words, the soul itself, subjective life simply, which is the true content. The emphasis is therefore throughout upon the animation of feeling, rather than upon the more immediate object. The most fleeting moods of the moment, the overjoyment of the heart, the swiftly passing gleams or clouds of careless merriment and jest, sorrow, melancholy, and complaint, in a word, all and every phase of emotion are here seized in their momentary movement or isolated occurrence, and rendered permanent in their expression. What we find here in the domain of poetry may be paralleled with what I previously referred to when describing *genre* paintings. The content, the subject-matter, is here the wholly contingent, and what is over and above this important is exclusively the character of the individual conception and mode of presentment, the charm of which in the Lyric will either consist in the aroma of exquisite feeling, or in the novelty of arresting points of view, and the genial suggestion of literary phrases and turns which surprise.

(*b*) In the *second* place we may observe in general with respect to the *form*, wherein the Lyric is composed, that here too it is the individual person, in the intimacy of his ideas or emotion that constitutes the focal centre. The growth of the whole is rooted in the heart and temperament; it starts, to be more precise, from a particular mood and situation of the poet. By virtue of this fact the content and conjunction of the particular aspects of its growth are not inferred from it objectively as a substantively independent content, or from its external manifestation as some really self-exclusive event, but are borrowed from the individual subject as such. But for this reason it is essential that the individual in question should himself

appear poetical, rich in fancy and feeling, or imposing and profound in his views and reflections, and above all should be essentially independent, the possessor of a unique ideal world, from which the servility and caprice of a prosaic nature is excluded.

The lyric poem, then, retains a mode of unity wholly different from that of the Epos, in other words, the mysterious intimacy of the mood or reflection, which expatiates upon itself, mirrors itself in the objective world, describes itself, or concerns itself as it wills with any other matter, always, however, retaining the right in the pursuit of such an interest to begin and break off very much as it pleases. Horace, for instance, very frequently comes to a stop at the very point, where, in the commonplace view of its literary treatment, we might suppose he had only just started with his subject. In other words, what he describes is simply his feelings, commands or arrangements for a banquet, say, without giving us further information as to how it went off. In the same way we have every conceivable mode of progression and combination supplied by the nature of the mood, the actual condition of the individual soul-life, the degree of passion, its excitement or rapid transition of conflicting emotion, or the tranquillity of the heart or the mind in some long-drawn process of contemplation. As a rule, in respect to all such subject-matter, we are able to determine very little that is fixed, owing to the repeated changes in the ever varied facets of the soul. I will therefore restrict myself to a few salient points of distinction.

(α) Just as we met with several specific kinds of epic poetry which showed a tendency to adopt a lyric vein of expression, so, too, the Lyric may accept as its subject-matter and its form an occurrence, which, so far as content and external appearance are concerned, are epic, and to this extent it will approximate to the latter type. Heroic songs, romances, and ballads belong to such a class. The form of the whole is in such examples narrative, inasmuch as it is the progressive advance of a situation or event, as among

other instances, a particular direction in the fate of a nation, which is communicated. And yet at the same time the fundamental temper is wholly lyric, inasmuch as the main object is not to give us a description and representation of the actual fact apart from all relation to the narrator, but rather to disclose his personal attitude to it in the way he conceives and feels it, whether with delight or complaint, whether as a stimulus to good or depressed spirits, the mood in short that rings throughout it. And similarly the nature of the impression which the poet endeavours to produce thereby is entirely that of the province of the lyric. In other words, what the poet seeks to effect in his audience is precisely that state of emotion, which the recounted event has produced in himself, and which he therefore has attached to his composition. He expresses his dejection, mourning, merriment, his fire of patriotism, and so forth, in an appropriate occurrence in such a way that it is not this fact so much which contributes, as it were, the focus, but rather the state of his emotional life we find reflected therein. And for this reason he, above all emphasizes those traits, and depicts the same with feeling, which are in accord with his own personal impulses; and in the degree of vivacity with which these are expressed by them the same feelings are likely to be excited in his audience. And thus, though the content may be epic, the treatment is lyrical.

(*αα*) To come yet more directly to detail there is, first, the example of the *epigram*, in such a case where it is not merely an inscription which states concisely the bald nature of some fact, but further associates with this an emotional state; where, in short, the content, regarded as the bare statement of external fact, is merged in a condition of the soul. In other words, the writer here ceases to surrender himself wholly to the object: rather he makes his own personality expressive in it; he records his desires with regard to it; he attaches to it his own sportive fancies, his acute or unexpected suggestions and associations. The Greek Anthology contains many such

witty epigrams which have lost the epic manner. In more recent times we find similar examples in the piquante couplets of the French, abundantly illustrated in their Vaudevilles. We Germans have much the same thing in our didactic distiches, Xenien, and the like. Even tomb inscriptions frequently approximate to this lyrical character in virtue of the strong emotions expressed.

(*ββ*) In much the same way the Lyric accepts a wider range in descriptive narrative. I will merely mention, as a composition of this class, the *romance.* It is the most obvious and simple form of it, in so far that is as it isolates the different scenes of an event, and then depicts rapidly and with the full force of their most important characteristics each on its own account, in descriptions marked throughout by sympathetic feeling. Such a consistent and well-defined grasp of the characteristic features of a situation, together with an emphatic assertion of the writer's absolute sympathy with his subject, is above all nobly represented in Spanish literature and makes such romances strikingly impressive. A peculiar clarity of atmosphere surrounds these lyrical representations which rather identifies them with the clear-cut definition of objective vision, than with the ideal world of the imagination.

(*γγ*) The class of the *ballad*, in contrast to the above, includes for the most part, if in less degree than the truly epic poem, the completeness of an independent event, whose reflection, of course, it merely embodies in the most conspicuous of its phases, while it seeks at the same time to give full, if concentrated and ideal emphasis, to the depth of the sentiment with which it is throughout interwoven, and therein the plaint, dejection, joy, and so forth, of the soul. English literature above all contains many such poetic compositions in the early and more primitive epoch of its history; and, generally, popular poetry delights in the narration of such histories and collisions, usually unfortunate, with a true and emotional emphasis

calculated to make both heart and voice thrill and falter with anguish. But in more recent times also among ourselves Bürger and, most famous of all, Goethe and Schiller, have composed masterpieces in this field; Bürger in virtue of his sombre tone of naïveté; Goethe through the impeccable clarity of his emotional, no less than imaginative vision, which forms the lyrical thread throughout; and Schiller, on account of his superb emotional emphasis on the fundamental thought which he seeks, in a wholly lyrical manner, to express under the form of an event, in order thereby to affect the hearts of his readers with a similar lyric movement of feeling and contemplation.

(*β*) The purely *personal* element of lyric poetry is rightly emphasized in those cases, when the fact of a given situation is taken by the poet as an effective means of expressing his *own* individuality therein. Such is the case in the so-called poems *of occasion.* So far back as the poems of Callinus and Tyrtaeus we find elegies of battle based on conditions regarded as real, which are made the stimulus of a personal enthusiasm, albeit the poet's own individuality, his purely private affections and feelings, are as yet not so much in evidence. The Pindaric Odes also bring to light in their panegyrics of particular contests, victors, and circumstances, a vein or impulse that is more private; and yet more in some of the odes of Horace we mark a definitely personal motive, or rather expressed thought to the effect, "I will as myself a man of culture and fame, write a poem on this subject." But the best illustration of all we have in our own Goethe, whose partiality for such a style was due to the fact that he discovered a poem in every incident of his life.

(*αα*) If, however, the lyric work of art is to be divested of all *dependence* of external occasion and purpose, that may be implied in it, and to be composed as a self-subsistent whole on its own account, it is obviously essential that the poet also only make use of such external stimulus as an

opportunity to express *himself,* his mood, delight, sorrow, or modes of thought and reflection generally. The condition of most importance to such an intimate mode of personal expression consists in the poet's ability to absorb the real content absolutely, converting it thereby into his own possession. The true lyric poet lives a life of introspection, he grasps relations in the light of his poetic individuality; and, however in varied fashion his inner life may be blended with the world around him, in its conditions and destiny, what he presents to us exclusively in such material is the unique and independent animation of his own emotions and observations. When, to take our former example, Pindar was invited to celebrate a victor of the Hellenic games, or undertakes this uninvited, he made himself so entirely master of his subject-matter, that his composition no longer so much appears a poem *on* the victor as an effusion of song created from his own resources.

(*ββ*) If we consider more closely the manner of presentment of such a poem *d'occasion,* we shall, no doubt, be ready to admit that the same can to a real extent borrow its more defined material and character, no less than its conceived organization as an artistic work, from the actual features of the occurrence or individual which constitute its content. It is, in fact, precisely from this content that the emotional movement of the poet proceeds. As the most illuminating, though an extreme example, I will merely mention Schiller's "Song of the Bell," which makes out of the varied stages of bell-foundry the significant and arresting moments in the composition of the entire poem, and only subject to this introduces the emotional element relevant thereto, as also the various observations upon human life and the description of its conditions. In a somewhat different manner, too, Pindar makes use of the place of birth of the victor, the exploits of the family to which he belongs, or other relations of life as an opportunity in his own person to exalt certain gods to the exclusion of others, or to mention these

particular exploits and results alone, or to emphasize exclusively the observations or maxims he has interpolated. From a further point of view, however, the lyric poet is absolutely free, inasmuch as it is not the external occasion as such, but rather the poet's *own* soul-life which is here the subject; and consequently it entirely depends on the particular views of the poet and the character of his general mood, what aspects of the subject-matter and in what threads of connection and sequence they shall be composed. In other words, we are unable to predict decisively and *a priori* the degree in which the objective occasion with its given content, or the purely personal factor of poet, shall be predominant, or whether both aspects shall on equal terms coalesce.

(*γγ*) Furthermore, it is not the incentive and its positive reality, but the ideal movement and conception of the individual soul which supplies the *focus of unity.* The particular mood or general review, which is aroused poetically by the occasion, these constitute the centre, radiating from which not merely the colour of the whole, but also the embrace of the particular features unfolded, the very mode of the execution and construction, and therewith the build and coalescence of the poem as a work of art are determined. In this way, to return to our previous example, Pindar possesses in the life-conditions of his victors a genuine core of reality for differentiation or amplification. In the particular poems, however, which he has written it is invariably other points of view, another mood altogether, whether it be of warning, comfort, or exaltation, which he makes most pervasive, and which, although such exclusively belong to the poet in his creative capacity, do none the less give him precisely that grasp of all he wishes to touch upon, execute, and hand to posterity in those historical facts, while unfolding therewith the illuminating and constructive power of genius, without which he would fail to secure the lyric effect intended.

(*γ*) But, *thirdly*, it is not absolutely necessary for the genuine lyrical poet to start from the external occurrence, which he recounts in a medium rich with emotion, or, indeed, from any such objectively real stimulus of his efforts. He is, let us repeat, a truly exclusive world *in himself.* He may find there both the original incentive and content, and consequently go no further than this ideal world of condition, event, and passion discovered in his own heart and soul. This is that domain in which man becomes, in virtue of his private inner life, himself the work of art; while the epic poet avails himself exclusively of the hero and his exploits and experiences for this purpose.

(*αα*) And yet in this field, too, an element of narrative may enter, where, as in the case of the songs of Anacreon, bright little pictures of adventure with Eros and the like receive the finish of delightful miniatures. Such an event, however, must obviously rather resemble the unveiling of a condition of personal soul-life. In a somewhat different mode of the same thing Horace, in his *Integer vitæ* makes use of the fact of his meeting a wolf, not to the extent that we can, therefore, call his poem the verse *occasion*, but rather regarding this fact as the prompting force of his first sentence and the serenity of the feelings of affection with which he concludes.

(*ββ*) As a rule we may also observe that the situation under which the poet depicts himself should not restrict itself merely to the *inner personal* life as such. It must rather attest itself as concrete, and thereby we may even say external totality. The poet, in short, reveals himself not merely in that inward personal life, but as one of the objects of the external world. In the example just cited of the Anacreon odes the poet depicts himself among roses, fair maidens, and youths in the merry enjoyment of wine and dance, without regret or yearning, without obligation, and yet without dislike of loftier aims, which, indeed, are not present at all; reveals himself rather as a hero, who freely and without reserve, and consequently without hesitation

or loss, is just this unity, is what he is, a man of his own type, and figures as such in this intimate artistic presentment. In the love-songs of Hafis also we may observe the entire vital individuality of the poet in all its changes of content, pose, and an expression which approaches close to self-conscious humour. And yet his poetry is without any specific theme, any objective picture, any god, or mythology; or, rather, when we peruse these light-hearted ebullitions, one feels as though it would be impossible for the Oriental to possess any such definite picture and constructive art. He passes easily from one object to another; he takes his walks abroad, but it is a scene in which the entire man, with his wine, his damsels, his court-life, and all the rest of it, is placed before us with delightful unreserve, without passion or self-seeking in the simplicity of his enjoyment eye to eye and soul to soul. Improvisations of this type adapt themselves in the most various ways not merely to a reflection of the soul-life, but also to external condition. If, however, the poet is absorbed in his own individual experience, we are not so much concerned to hear his particular fancies, love affairs, domestic arrangements, and the history of his uncles and aunts. We are so invited, for instance, in Klopstock's Eidli and Fanny, as to nave some vision given us of what is of universal human interest, in order that our sympathies may be roused. From this point of view, therefore, such lyrical poetry can readily degenerate into the spurious assumption that what is essentially private and particular must necessarily awaken interest. On the contrary, it would be no incorrect description of many songs of Goethe if we called them "Songs of *Comradeship*," although they are not exactly executed by the poet under such a category. In other words, it is not so much himself that a man offers in society; rather he places his particularity in the background, and converses with the help of something else, whether it be a story or an anecdote, seizing its specific features in some particular mood, and communicating them agreeably to such a temper. In a case like

this it is not exactly the poet, and yet it is himself for all that. It is not himself he gives us, but something else as best he can. He is, in short, an actor, who runs through an infinite variety of parts. First he lingers on this, then on that; he reviews momentarily a scene, then maybe a group of people. But whatever he may endeavour to reproduce, it is throughout his individual artistic soul-life, his own experience, his own feeling, which is vitally interwoven with it.

(*γγ*) But, further, in so far as the individuality of self-conscious life is the true source of the Lyric, the poet is justified in limiting his expression to his own moods and reflections without any further combination of them in a concrete situation that includes a truly objective character. It is in this direction that examples of what is little more than an empty fluting for fluting's sake, the song and trill simply on its own account, will yet give us genuine lyrical satisfaction. In such the words are to a more or less extent merely the vehicle of cheerfulness or sorrow, whose effect, moreover, very readily serves as an invitation to musical accompaniment. Folk-songs especially very often amount to little more than this. In the songs of Goethe, too, though we may no doubt discover here a more defined and abundant mode of expression, it is not unfrequently simply a single and transitory bit of merriment that is vouchsafed, a passing mood that the poet does not attempt to throw aside, but on the tune of which he pipes for a moment in his tiny song. In others, of course, his treatment of similar moods is on a larger scale, even systematic, as, for instance, in the poem: "*Ich hab mein Sach' auf nichts gestellt*," in which the poet passes before us as things that come and vanish, first, money and property, then women, travel, fame, honour, and, last of all, fight and war, retaining throughout as the ever-recurring refrain of stability his own free and careless cheerfulness. Conversely, however, the intimate individual life may from the same point of view grow in depth and expansion, in conditions of the soul of the most

imposing proportions and ideas that embrace the world itself. A considerable number of Schiller's poems are of this type. What is great, what opens to intelligence, this is the incentive of his heart. But he will neither celebrate in hymn fashion a religious or otherwise profound subject; nor will he be the minstrel who looks for inspiration without him to the pertinent fact or occasion. He sings in the presence of, and inspired by, his own soul-life, the highest interest of which are the ideals of life, beauty, and the imperishable claims and thoughts of our humanity.

(*c*) There is a *third* consideration we have to deal with in connection with the general character of lyric poetry. It is the nature of the general stage of human development and culture from which the isolated poem originates.

In this respect, too, the Lyric occupies a position which is to be contrasted with Epic poetry. In other words, while we regarded as necessary for the full bloom of the true Epos a phase in the nation's growth which was, speaking generally, undeveloped, at least in the sense that it had not ripened in the prosaic acceptance of its actual life, the times which favour most of all lyrical composition are those which already are in possession of a more or less fixed organization of social condition. It is in such a period that the individual seeks a reflection of his intimate personal life in contrast to this outer world, creating from it and within its limits an independent whole of emotion and idea. For in the Lyric it is not, we repeat, the objective solidarity and individual action, but the individual person as self-conscious life which supplies both content and form. This, however, must not be understood in such a way as though the individual, in order to express himself in lyrical form, must perforce disjoin himself from every connection with national interests and the opinions, and with rigid and exclusive severity remain as he stands.

On the contrary, with such an abstract self-subsistency we should only have left us for content the wholly contingent and particular passion, the mere caprice of concupiscence and affection, false idiosyncrasies and distorted originality would have unlimited opportunities. Genuine lyrical poetry, like all other poetry, has no doubt to express the content of the human heart in its truth. Yet none the less, regarded as the content of the Lyric, what is most a matter of fact and substantial must appear absorbed in personal feeling, vision, imagination, and thought. And, in the *second* place, the question here is not so much simply expression of the personal inner life, is not so much concerned with a primary and direct statement in the epic fashion, what the facts are, as with an expression of the poetical nature in a manner both artistically fruitful and wholly different from chance and ordinary modes. It follows that the Lyric requires, precisely on account of the fact that the concentrated life of the heart unfolds itself in manifold feelings and comprehensive views, and the individual is conscious of the poetry of his most intimate life as nested in a world that is already more prosaically organized — an artistic culture already secured, which must assert itself as the flower and independent product of the individual's natural endowment thus trained to a perfect result. For these reasons the Lyric is not limited to particular epochs of the spiritual development of a people, but is the rich blossom of the most varied. To an exceptional degree is it favoured in more recent times, in which everybody is entitled to have and express his own views and emotions.

I will, however, draw attention, in the interest of really important distinction, to the following general considerations.

(*a*) In the *first* place, we have the type of lyrical expression peculiar to *folk-songs.*

(*αα*) In these above all we have witness to the varied and distinct qualities of national character. It is on account of this, and consonant with

the widely-prevailing curiosity of our generation, that great efforts are made to collect folk-songs of every kind, in order to increase our acquaintance with the peculiarities of every national spirit, and therewith our sympathies and vital contact with such. Already Herder has done much in this direction. Goethe, too, with the help of his own more independent imitations, has materially assisted an approach to very different examples of this style of poetry. Complete sympathy is, however, only possible for the songs of one's own people; and however much we Germans are able to make ourselves at home in the work of foreign lands, the fact remains that the ultimate aroma in song[5] of the intimate life of another folk can only appear as alien, that we shall only catch the echo of the tone of feeling that truly belongs to it, with the assistance of a more native reflection of its content.[6] This Goethe has imported into his songs of a foreign subject-matter, stamped as they are with the finest sympathy and beauty. We may take as an example the lament of the noble spouse of Asan Aga, imitated from the Icelandic — only so far as to retain throughout the unique spirit of such poems unimpaired.

(*ββ*) The general character of the lyrical folk-song is comparable to the primitive Epos in virtue of the fact that here too the poet does not make himself his subject-matter, but is absorbed in his selected material. Although, therefore, intensity of soul in its extreme concentration may express itself in the folk-song, it is nevertheless not a single person with the artistic expression of whose private experience we are made acquainted. It is rather a national state of feeling, which the author completely assimilates, in so far as it possesses, when taken by itself, no intimate form of idea or feeling wholly independent of the nation's existence and interests. And a condition is necessary, as the presupposition for such an inseparable union, in which independent personal reflection and culture is not yet awakened, so that the poet is simply in his creative capacity merely the vehicle in the background, by means of whom the national life is expressed in its lyrical

emotion and general outlook. This directly primitive character no doubt communicates to the folk-song an unconscious freshness of downright grasp and striking veracity, which is often very effective; but it receives thereby along with it very readily a fragmentary appearance; it is defective in the continuity of its exposition, which may amount to actual obscurity. The feeling dives into depth, but cannot and will not attain to full utterance. Moreover, as before observed, what is absent from such a point of view throughout, however much the form in general is wholly lyric, in other words subjective, is just the lyrical individuality, which expresses this form and its content as the possession of its *own* heart and mind, and the creation of its *own* artistic resources.

(*γγ*) Peoples, therefore, which confine themselves to poetry of this type, and do not combine such composition with that of the further stages of lyrical, epic, or dramatic work, are as a rule in great measure barbarous nations, uncultured, characterized by transitory feud and catastrophes. If they themselves, in such heroic ages, really combined to form a truly pregnant whole, whose particular aspects were already fused together in an independent and withal harmonious objective union, which could supply the ground for essentially concrete and individually distinct exploits, we should find in them, along with such primitive poetry, epic poets as well. The condition, out of which such songs assert themselves as the single and ultimate mode of poetic expression, is therefore rather limited to the field of family life and the association of clans, without any further organization such as belongs already to the riper perfection of the heroic community. If we are reminded here and there of national exploits, such are for the most part conflicts waged against foreign aggressors, expeditions of pillage, reprisals of savagery with savagery, or deeds of one individual against another in the same people, in the narration of which lament and dejection or ecstatic jubilation over one conqueror after another, are the moods

throughout prevailing. The national life as it actually is, as yet unfolded in its wholly free development, is relegated to the background in contrast with the world of more personal feeling, which also, on its own account, betrays an immaturity; and, however much thereby we gain in concentration of effect, the result only too frequently remains, so far as content is concerned, rude and barbarous. The question then, whether folk-songs should possess for us a poetic interest, or on the contrary repel us to some extent, depends on the kind of situation and emotion they portray. That which appears admirable to the imagination of one people, will readily strike another as wanting in taste, horrible, and offensive. There is, for example, a folk-song which tells us the story of a wife who was immured at the command of her husband, and all that her plea for mercy could effect was that apertures should be left open for her breasts, in order that she might suckle her child; we are told that she remained alive until her child was weaned. This is a barbarous and frightful situation. And in the same way tales of robbery, exploits of the bluster or sheer savagery of individuals, possess nothing in them in which alien peoples of a higher culture can sympathize. Folksongs, consequently, very often run into great detail as to the quality of which there is no fixed standard of comparison, because such is too far removed from our common humanity. When we consequently, in more recent times, are made acquainted with the songs of the Iroquois, the Esquimaux, and other wild nationalities, the circle of a true poetic enjoyment is in no wise thereby enlarged.

(*β*) Further, inasmuch as the Lyric is the entire expression of the inward life of Spirit, it can neither restrict itself to the mode of expression nor the content of the genuine folksong, or of later poems composed in a similar spirit.

(*αα*) In other words, on the one hand, it is of essential importance, as already remarked, that the wholly self-absorbed soul should detach itself from this absolute concentration and its direct introspection, and should pass on instead to the free grasp of itself which, in the conditions above described, is only incompletely the case. On the other, it is necessary that it should expand in a world abundant in ideas, passions, varied conditions, and conflicts, in order to endow with ideal expression everything that the human heart is essentially able to apprehend, and then communicate as the birth of its own spirit. For the collective wealth of lyrical poetry should express in poetic form all that the inner life comprises, so far as the same can pass into poetry, and therefore finds itself at home alike in all phases of spiritual culture.

(*ββ*) And, *secondly*, with the advent of a free self-consciousness is bound up the freedom of an assured *art* of its own. The folk-song sings forth, just as any natural song, straight from the heart. A free art, however, is aware of itself; it requires a knowledge and desire of that which it produces; and requires culture to promote this knowledge, as also an executive power, which is expert in the finest composition. When, consequently, genuine epic poetry has to conceal the individual creative power of the poet, or rather it lies with the entire character of the age of its origin that such should not yet be visible, this result is merely because of the fact that the Epos deals with the nation's positive existence rather than that which issues from the personal life of the poet himself, and that it is not present in poetry in such a close personal relation, but rather appears as a self-evolved product essentially independent. In lyrical poetry, on the contrary, the creative activity no less than the content are inseparable from the inner life, and are bound to declare themselves as such in actual fact.

(*γγ*) In this respect, later forms of lyric art are expressly distinguishable from the folk-song. There are, no doubt, folk-songs which originate

contemporaneously with the works of a genuine lyrical *art.* These latter, however, belong to a range and type of individuals such as — far from participating in more modern stages of artistic culture — are, in the entire nature of their general outlook, not yet liberated from the immediate popular sense. We must, however, not regard this distinction between the Lyric of the folk-song and the artistic poem as though it was only when reflection and the artistic consciousness, in union with deliberate executive ability, appear with all the elegance of such a union, that the Lyric attains to its perfection. Such a notion would really amount to this — that a Horace, for instance, and the Roman lyric poets generally, were to be reckoned among the finest writers of this type, or even in their own range that the Master Singers were preferable to the preceding epoch of the genuine Minnesong. Such an extreme deduction from our previous statement is not justified. What we ought to conclude is this, that individual imagination and art directed to the service of this very self-consistent personal life, which in fact constitutes its principle, presupposes also, for the basis of their true perfection, a free and self-trained recognition of imaginative idea no less than artistic activity.

(*γ*) We have our *final* phase of composition to distinguish from those already discussed. The folk-song appears before the true elaboration of a prosaically organized condition of actual conscious life. Lyric poetry of the truly artistic type, on the other hand, wrests itself away from the prosaic coordination which surrounds it, and creates from the poet’s imagination, in its acquired independence, a new poetic world of inward observation and emotion, by means of which, for the first time, the true content and type of expression truly adequate to the human soul, as seen from within, becomes the object of vital art. There is, however, over and above this, a form of intelligence which, from this point of view, stands in a more exalted position than the imagination of the emotional or conceptive life, inasmuch

as it is able, with more penetrative universality and more necessary coalescence to bring its content before our free cognition than is ever possible to art. This is *philosophical thought.* Conversely, however, this form is attached to the abstract condition of being exclusively evolved in the medium of thought, posited as wholly ideal universality; and, in consequence, the concrete man may find himself also constrained to express the content and the results of his philosophical consciousness in a concrete way, that is, as permeated by his temperament and sensuous perception, his imagination and feeling, in order thereby to possess and exhaust the absolute expression of all that engages either soul or intellect.

From such a standpoint we may distinguish between two principal types of conceptive activity. It may, in short, either be the imagination which, straining beyond its own domain, struggles with the movement of pure thinking, without successfully attaining the clarity and secured exactness of philosophical exposition. In this case the Lyric is for the most part the ebullition of a soul engaged in strife and contention, which in its fermentation does violence both to art and abstract thought. It transgresses one province without the ability to make itself at home in another. Or we may find that it is rather the tranquil movement of philosophical thought in its essential medium, which may seek to animate its clearly grasped and systematically developed thoughts with emotion, to make them perceptible to sensuous apprehension, and to exchange the explicit scientific process and sequence in its causal necessity for that free play of particular aspects, beneath the apparently loose connection of which art is the more compelled to conceal their ideal bonds of association in proportion as it is disinclined to narrow itself to the jejune style of purely didactic exposition. As an illustration of this latter tendency, we may point to many of Schiller’s poems.

2. PARTICULAR ASPECTS OF LYRICAL POETRY

Having thus considered the general character of the content of lyric poetry, and the mode of its expression, as also the varied grades of culture which are more or less consonant with its fundamental principle, it will be our further task to examine these general points of view more nearly in the *detail* of their more important features and relations.

Here, too, I ought at starting once again to emphasize the distinction which obtains between epic and lyrical poetry. In our consideration of the former we directed our attention above all to the primitive national Epos, and merely referred incidentally to the inadequate collateral branches, as also to the poet in his creative capacity. This we are unable to do in the case of the type under discussion. On the contrary, we shall find that subjects of the greatest importance invite our review as respects the individual creative power; and, on the other hand, in respect to the classification of the several types in which lyrical poetry, whose general principle it is to disintegrate and isolate the content and its configurations, is respectively differentiated. We may define the subsequent course of our investigation as follows:

First, our attention will be directed to the lyrical poet himself.

Secondly, we propose to examine the lyrical work of art as the creation of the individual poet's imagination.

Thirdly, we shall classify the types which are deducible from the general notion of lyrical composition.

(*a*) *The Lyric Poet*

(*α*) Now the content of the Lyric embraces, as we have seen, first, a type of contemplation, which connects the universal quality of determinate being with its conditions, and, secondly, the manifold character of its detailed aspects. Regarded, however, as pure generalizations and particular points of view of emotional condition these constituents, both of them, are nothing more than abstractions. In order that these may acquire a vital lyrical individuality, a principle of combination is necessary which can only be of

an ideal, in other words really personal[7] character. Consequently the creatively concrete person, the *poet* himself, must be further presupposed as the focus and in fact realized content of lyrical poetry. He must be there, however, in a form which is not carried to the point of definitive act and deed, or to that of the evolved movement of dramatic conflicts. His exclusive expression and activity is on the contrary restricted to the fact that he endows his inner experience with an articulate speech such as portrays the spiritual significance of himself as subject in his self-expression, whatever the material selected may be, and endeavours to arouse in and keep the hearer alive to the like meaning and spirit, the same soul-state, the similar course of reflection.

(*β*) But, furthermore, the expression cannot rest alone in this result, however successful, in so far as it is for others a free overflooding of buoyant delight, or the resolution and reconciliation of grief in song and lyric, or the yet profounder impulse, which issues in the most serious emotions of heart and the most far-reaching views of intelligence. The man who sings and can write poetry has a necessary vocation thereto. He composes because he *cannot do otherwise.* At the same time the external incentive, the direct invitation and the like are by no means excluded. The great lyric poet, however, in such a case soon swerves aside from such an external stimulus. His supreme object is himself. To take the example once more to which we have constantly recurred, Pindar was frequently invited to celebrate this or that laurel-crowned victor, nay, he frequently accepted payment therefor; and yet, for all that, it is he himself, the minstrel, who changes places with his hero. He combines freely his own unfettered imagination with his praise of the exploits of ancestors, or it maybe his memory of myths; or, when he gives voice to his profound views of life, of wealth, of mastery, of all that is great and deserving, of the supremacy and loveliness of the Muses, and above all of the high vocation of the singer. It

is not so much the hero in the renown that he spreads far and wide, that he honours in his poems. We are invited to listen to him, the poet. The honour is not to him in that he celebrates the victor, but rather to the victor that he is celebrated by Pindar. And it is this emphatic personal sense of greatness which constitutes the nobility of the lyric poet. Homer, as an individual person, is in his Epos so entirely sacrificed that people nowadays are loth to admit that he ever existed at all. His heroes live on for ever. Pindar's heroes are for us little better than empty names. He himself, however, the self-celebrated and self-honoured, remains before us immortal as the poet. The fame which his heroes claim is merely an appanage to that of the lyric singer. Even among the Romans the lyric poet to some extent aspires to such an independent position. Suetonius tells us, for instance, that Augustus wrote these works to Horace; *an vereris, ne apud posteros tibi infame sit, quod videaris familiaris nobis esse.* Horace, however, with the exception of those times, easily demonstrable, where he writes in an *ex officio* manner of Augustus, betrays for the most part a precisely similar proud self-consciousness. His fourteenth ode of the third book, for example, opens with a reference to the return of Augustus from Spain after his victory over the Cantabrians. But the poet goes on to celebrate the fact, that on account of the tranquillity, which the emperor has given the world, he himself as poet is able quietly to enjoy his easy-going leisure and his muse; he calls for garlands, unguents, and venerable wine to celebrate the occasion, and invites in all haste his mistress — in a word, he is simply preoccupied with the arrangements for his own banquet. We hear, however, at this time less of his love difficulties than in his youth, when Plaucus was consul, an occasion where he expressly says to the messenger he despatches:

Si per invisum mora janitorem
Fiet, abito.

We may regard it as an even more honourable trait of Klopstock, that he felt in his day the independent worth of the singer, and by his free expression of this and his regulation of his behaviour consonantly thereto, disengaged the poet from his subservience to a court and any or every patron,[8] as also from a tedious and useless toying with trifles, which is the ruin of a man. However, the fact remains that it was no other than this very Klopstock whom, in the first instance, the bookseller regarded as his poet. It was Klopstock's publisher in Halle who paid him one or two thaler, it appears, for the manuscript of his Messias, adding over and above this, however, an order for a waistcoat and breeches, and introduced him thus set up into society, letting it clearly be seen from the nature of such a get up that he was responsible therefor. In some contrast to this, so at least we are informed at a later date on evidence, however, that is not irreproachable,[9] the Athenians erected a statue to Pindar, because he had celebrated them in one of his poems, and sent him, moreover, twice the amount of the fine[10] the Thebans refused to exempt him from on account of the inordinate praise he had lavished on an alien city. Indeed we have the statement that Apollo himself declared through the mouth of the Pythian prophetess that Pindar was worthy of receiving half of all the gifts which the whole of Hellas, as in custom bound, brought to the Pythian games.

(*γ*) Throughout the entire compass of lyric poetry the synthetic unity of a single personality asserts its presence in virtue of its poetic soul-movement. The lyric poet is, in fact, moved to express everything that assumes a poetic form either in his emotional or intelligent life in the song. In this type of composition Goethe is pre-eminently noteworthy, who in all the variety of his full life was thus continuously creative. He was unquestionably in this respect a quite exceptional model. It is rarely that we find an artistic personality, who, while retaining as Goethe's did, an interest so active on all sides and is able to live a life, despite all such self-expansion, so entirely

self-possessed, so ready to transmute everything it touches into the poetic vision. His life in its public relations, the peculiar nature of his heart, which rather impressed with its reserve than the ease of its approach, the indefatigable effort of his scientific pursuits and enquiry, the general conclusions of his trained and practical experience, his ethical maxims, the impressions, which the varied and conflicting facts of his times made upon him, the inferences he deduced from such, the effervescent joy of life and courage of his youth, the well-organized force and ideal beauty of his manhood, the comprehensive genial wisdom of his old age — all this passed into the magic crucible of his lyrics, where the most delicate play of emotion, no less than the most severe and painful conflicts of spirit, alike find their expression and by this means their deliverance.

(*b*) *The Lyric Work of Art*

Secondly, in respect to the lyric poem as a poetic work of art, we are no doubt in general not able to advance much. The fortuitous character of the abundance of its many modes of expression, and the forms of its equally varied and incalculable content make this inevitable. The peculiarly personal nature of this class of work, however much the same is imperatively subject to the general principles of beauty and art, none the less brings with it the necessary result, that the range of the formal and melodious possibilities of its exposition admit of no theoretic definition. For our purpose, therefore, the only question of importance is the nature of the distinction of artistic type that obtains between the lyric and the epic product.

Upon this I will briefly draw attention to the following points of importance:

First, the unity of the lyric composition.

Secondly, the nature of its progressive disclosure.

Thirdly, the external aspect of its verse-measure and general exhibition.

(*α*) The importance, which the Epos possesses for art lies, as already observed, and pre-eminently so, in the case of the primitive Epopaea, in the consummate elaboration of the perfected artistic form, which as from the repository of the full embrace of the national spirit, places before our vision one and the same composition in all the wealth of a completely evolved content.

(*αα*) The true lyric work of art will not undertake to present thus before us a synthesized whole of such extension. The principle of personality can no doubt proceed to a comprehension of subject-matter of universal pretensions. To be able truly to enforce itself, however, in its individual independence, it necessarily implies the collateral principle of disintegration and isolation. At the same time a variety of truth, phenomenal or ideal, derived from natural environment, the memory of one's own or another's experience, from mythical and historical events, and the like, is not therefore excluded: but such an extension of view must not be permitted, as with the Epos, on the ground that it belongs to the unified *complexus* of a given sphere of reality, but is rather solely justifiable for the reason that it springs to renewed life in the memory of the poet, and in his impulse and gift of vivid association.

(*ββ*) We must consequently regard the intimate personal life as the true integrating principle of the lyric poem. This inward life, taken simply, is in part the wholly formal unity of the self-conscious self; in part also it is split up and dispersed in the most varied particularity, and the most diverse content of ideas, feelings, impressions, and perceptions, whose power of combination is solely due to the fact that it is one and the selfsame personal identity which serves essentially as their vehicle. In order therefore that this selfidentical subject may form the focal centre of the work of art, it must, on the one hand, have reached the point where the mood or situation is *defined* in its *concreteness*, and on the other it must *affiliate* itself with this isolation

of its own possessions as with itself to the extent that it feels and pictures itself in the same. It is only by this means that it becomes an essentially defined whole of such a personal character, and exclusively expresses that which is emphasized by reason of such definition, and is yet coalescent with it.

(*γγ*) Lyrical in the most pertinent sense is in this connection the emotional mood or colour as concentrated in a concrete condition, inasmuch as the sensitive heart is that which is the most vital and personal factor of the subjective lips. Reflection and a contemplation which is mainly absorbed in generalization very readily tend to the didactic, or are likely to assert what is substantive and positive in the content under an epic mode.

(*β*) With respect to our *second* point, viz., the progressive disclosure of the lyric subject-matter, speaking generally, exact definition is here too out of the question. I shall, therefore, restrict myself to a few searching observations.

(*αα*) The progressive exposition of the Epos is of a dilatory description, and it expands throughout in the display of an actual world of diversified character. In the Epos the poet projects himself into the *objective* world, which is set before us in the independent form and movement of its own reality. In contrast thereto it is the emotions and reflection which in the lyric composition absorb the given world into themselves, animate the same within this ideal element, and, only after it is itself converted into a constituent of this personal life, give form and expression to it in language. In contrast to the epic principle of extension we have therefore in the Lyric that of *assimilation*,[11] and have above all to seek for our effect by means of the implied ideal depth of expression rather than the diffuseness of descriptive or explanatory detail. None the less, however, between the extremes of an almost speechless conciseness and the idea worked out into absolute lucidity of speech every conceivable sort of nuance and degree of

clarity is still possible. To as little extent is it necessary that a ban be placed on all reflection of external objects. On the contrary genuinely concrete lyric compositions disclose the individual in his external conditions; they accept, therefore, as an essential feature of their content, natural and local environment. In fact there are poems entirely limited to such descriptions. In such cases, however, it is not so much the reality in its objective presence and its plastic presentment, as the accord with which such objects affect the soul, the mood excited by them, the feelings of the heart under such positive conditions, which are, in fact, the lyric result. It is in short not this or that object as presented to our eyes, in its several features, which ought mainly to impress our inward vision, but the emotional forces which are made vital in the same, and which have for their aim a similar state of feeling and contemplation in ourselves. Romances and ballads are perhaps the most obvious illustration of this, which, as I have previously maintained, approach the lyrical type in proportion as they exclusively emphasize those characteristics of a given event which are consistent with the state of the inner life, in which the poet writes, and disclose the course of his narrative in such a way, that we receive a distinct and life-like echo back again of this personal temper. For such reasons all out and out reproduction of material objects, even though stamped with considerable emotion, nay, even the diffuse characterization of emotional states, can only be of subordinate effect in lyrical effort, if compared with concise concentration of effect and the vivid and significant expression.

(*ββ*) We may add that *episodes* are permissible as well to the lyric poet; but he ought to employ them on other grounds than those which justify their epic use. In the latter case they are implied in the notion of the externally independent collocation of the different aspects contained; and, in respect to the advance of the epic action, they also are significant as points of retardation and hindrance. Their lyrical justification is rather subjective in

its character. The living personality in short surveys his private world more rapidly; his memory recurs to the most varied subjects on equally various occasions; he combines material of the most divergent nature; and, without departing from his true and fundamental emotional state, or the object of his thought, gives free play on all sides to his imagination and contemplation. An animating spirit of the same kind pervades the inner poetical life, although for the most part it is impossible to say whether this or that feature in a lyric poem is to be understood as episodical or not. As a general rule, however, digressions, so long as they do not violate the unity, and above all unexpected changes, witty combinations and sudden, or even violent transitions are peculiarly appropriate to the Lyric.

(*γγ*) On account of this the nature of the forward movement and bond of connection in this domain of poetry may be various, and in some measure marked by excessive contrast. Generally no doubt the Lyric, quite as little as the Epos, adopts the caprices of ordinary conscious life, or the purely scientific consequences, or the speculative process of philosophical thought in its necessary development. It requires indeed a freedom and self-subsistency in its single features. But whereas, in the case of the Epos, this relative isolation is referable to the form of the phenomenal reality, in the type of which its realization is centered, the lyric poet, on the contrary, communicates to the particular emotions and ideas, in which he is himself expressed, the character of a free self-assertion. Each and all, although equally distrained from similar modes of feeling and observation, nevertheless, as viewed separately, absorb his spirit, which remains concentrated upon each severally, until it is diverted to other points of view or other emotional states. The movement of the whole may therefore have little to arrest its tranquil flow, but with equal right we may find it pass without any mediation, and in one bound to material of a totally different character. The poet, instead of following the logical current of his thought,

becomes, it would seem, in this sudden flight of ecstatic intoxication mastered by a force, the pathos of which rules and carries him away in spite of himself. The impulse and conflict of such passionate intensity is so characteristic a feature of certain forms of lyric composition, that, for example, Horace in many of his poems is at pains to harmonize with deliberate artistic means such apparently dislocating breaks in the poem's connection. For the rest I must entirely pass over the various intermediate phases of treatment, which fall between the extremes of the most lucid connection and most even flow on the one side, and that of the unrestrained impetuosity of passion and enthusiasm on the other.

(*γ*) *Finally*, of our above three divisions of the immediate subject, we have left us to discuss the *external form* and actual presentment of the lyric composition. Above all we shall have to deal with *metre* and the *musical accompaniment.*

(*αα*) It is obvious enough that the hexameter in its even, sustained and none the less life-like forward movement is most exceptionally fitted as the measure of the Epic. The demand of the Lyric is rather for an extreme *variety* of metres with every kind of co-ordination in their form. The material of the lyric poem in short is not the object in the form wherein it unveils itself in Nature, but the movement of the poet's own soul, the regularity or change of which, its perturbation or repose, its peaceful flow or tumultuous wave and leap, must find expression in the time-movement of the word-length, in which such inward life is asserted. The nature of the prevailing mood and the mode of imaginative conception throughout ought to meet with an echo in the verse-measure itself. The lyric effusion indeed is placed in a far more intimate relation to time, regarded as the external medium of its communication, than the epic narrative, which consigns its phenomenal facts to the past, and associates or interweaves them under a mode of extension more analogous to that of spatial condition. The Lyric, in

contrast to this, displays the momentary emergence of emotion and idea in the temporal juxta-position of their origin and elaboration. It has therefore to clothe in artistic form the varied temporal movement itself. To this distinctive character belongs, in the *first* place, the more diverse sequence of long and short syllables in a more strongly emphasized inequality of rhythmical feet; and, *secondly*, the more varied use of the caesura verse — and *thirdly* the rounding off of the strophes, which not only admit of abundant alternation in respect to the comparative length of particular lines, but also relatively to the rhythmic configuration of these on their own account and in their immediate sequence to each other.

(*ββ*) Yet more lyrical in its effect — a second feature this — is the musical sound of words and syllables simply. The most important examples of this are alliteration, rhyme and assonance. In the system of versification under discussion what is predominant, as I have already explained in a previous passage, is, on the one hand, the ideal significance of syllables, the accent of the meaning, which disjoins itself from the purely natural element, as taken by itself, of their assured quantity, and then defines under the direction of the mind their duration, emphasis and subordination; which, from a further point of view, asserts itself in isolation as the expressly concentrated sound of definite letters, syllables, and words. The Lyric is pre-eminently associated with this spiritualizing process effected by ideal significance, no less than this emphatic insistence of sound. It in fact not merely restricts its acceptance and expression of all that positively is or appears to the meaning which such possesses for the inward life, but also lays hold of sound and musical tone as the significant medium of its communication. No doubt in this sphere, too, the element of rhythm may associate with rhyme; but even here this is effected in a manner which is closely related to the time-beat of music. Strictly speaking, therefore, the poetic use of assonance, alliteration and rhyme is limited to the province of

the Lyric. For although the Epos of the Middle Ages is, in accordance with the nature of more modern languages, unable to keep itself aloof from these forms, this is mainly permitted for the reason that here, too, the lyrical element is throughout more insistently active within the domain of epic poetry itself, and effects a more forceful entrance where the subject-matter consists of heroic songs, romances, ballads, tales, and the like. And we find the same thing in dramatic poetry. What, however, is the peculiar possession of the Lyric, is the diversified configuration of rhyme, which is elaborated and perfected by means of the recurrence of similar or the alternation of different letters, syllables and verbal quantity in variously organized and alternated strophes of rhyme. Such differentiation is also of undoubted service both to epic and dramatic poetry, but only on the same ground that rhyme itself is not excluded altogether. The Spaniards, for instance, in the most cultured epoch of their dramatic development, gave the freest play to such craft in the expression of passion by no means appropriate to the genuine drama, interweaving octave rhymes, sonnets and the like with more usual verse-measures. By so doing they at least testify, in the continuity of such assonances and rhymes, their predilection for the musical element in language.

(*γγ*) *Finally*, lyric poetry, to a far more considerable extent than is possible with the unassisted aid of rhyme, avails itself of *music*, by means of which the uttered word becomes veritable melody and song. Such a leaning may, moreover, be completely justified. Or, in other words, the less lyric subject-matter and content possess on their own account independence and objective stability, but are rather, above all, of an ideal character, rooted exclusively in the personal life, while at the same time an external medium of articulate arrest is essential, to that extent is the demand for a decisive medium of communication more insistent. Precisely for the reason that it remains of ideal intention, the means it employs as a stimulus to others must

be the more effective. Such an excitant of our emotional life can only be music.

We find consequently, even in respect to external execution, that lyric poetry is almost invariably associated with musical accompaniment. At the same time we should note an essential gradation in this power of combination. The romantic and above all the modern lyric, no doubt more exceptionally so in such songs, in which the temper, the emotional mood is predominant, and the function of music is to emphasize and expand this inner beat of soul-life in actual melody — are no doubt most readily adapted to such melodic fusion. The folk-song is an obvious example which both delights in and demands a musical accompaniment. We shall find in modern times more rarely a composer for the canzonet, elegy, epistle, or even the sonnet. The reason of this is that in cases where idea, reflection, nay, even emotion are made completely explicit in the poetry, and increasingly liberated from the bare point of spiritual selfconcentration, and, further, from the sensuous medium of the art, the Lyric already secures, in its deliverance as speech, a greater self-stability, and lends itself less simply to a free association with the vague definition of music. On the other hand in proportion as the inner life expressed is not made explicit to that extent the aid of melody is required. How it came about, however, that the ancients, despite the pellucid clarity of their diction, availed themselves of music in its actual delivery, and the measure in which they did thus make use of it, I shall have occasion to deal with subsequently.

(*c*) *Types of the Genuine Lyric*

With regard to specific types, in which we may classify lyrical composition, I have already referred with more detail to some which form the transition step from the narrative form of the Epos to the more subjective mode of exposition. From a contrary point of view it might seem desirable in the same way to demonstrate the beginnings of the dramatic.

This inclination, however, of passage to the animation of the drama is exclusively and in essentials restricted to the circumstance that the lyric poem too as conversation, without, however, carrying the movement of action to the point of actual conflict, may itself accept the external form of dialogue. We shall nevertheless omit further allusion to these intermediate and hybrid stages, and restrict our cursory examination to those forms in which the real principle of the Lyric fully asserts itself. The main cause of this distinction is to be found in the attitude, which the artistic consciousness assumes relatively to its object.

(*α*) To be more definite the poet — this at least is one direction — annuls the particularity of his emotion and idea, and is absorbed in the general contemplation of God or gods, whose greatness and might permeates the whole of the personal life, and causes the poet as an individual person to vanish. Hymns, dithyrambs, paeans, psalms, all belong to this class, which are moreover quite differently treated by different peoples. I propose merely to draw general attention to the following characteristic of such poetry.

(*αα*) The poet, who is raised above the narrow limitation of his own purely personal life and external conditions, or the ideas which are therewith associated, replacing these with that which appears to him and his people as absolute and divine, may, in the *first* instance, completely depict the divine in an objective presentment, and set forth this, as thus projected and executed for the spiritual vision of others, to the honour and power of the glorified god. The hymns which are ascribed to Homer are of this character. They contain above all mythological situations and histories of the divine Being, in whose celebration they are composed, which are not merely conceived in the ideas of symbolism, but are clothed in the downright objectivity of the Epos.

(*ββ*) In contrast to this, *secondly*, the dithyrambic impulse, in its more *personal* aspect of an exalted divine service — overwhelmed, as it is, by the

power of its object, shattered and stunned to its soul-foundations — cannot, by reason of the general diffusion of its emotional state, go so far as to present an objective image and form. It is more akin to the lyrical absorbtion. We have here simply ecstatic rapture of soul. The singer breaks out and forth from himself; he is so exalted directly into the Absolute, steeped in the being and might of whom he exultantly sings his praise of the Infinite, into the depth whereof he plunges, or that of the natural world, in whose splendour the profound wealth of the Godhead is declared.

The Greeks, in the solemnities of their worship, have not limited themselves for long to such mere outcries and appeals. They have sought to intermingle with such ecstasies the narrative of, definite mythical situations and actions. Such expositions interposed between the effusion of lyric poetry, became gradually of most importance, and created the drama, such narratives being asserted as action in its lifelike form, and independently on its own account, a drama, which again in its turn received as a constituent feature the lyrics of its choruses.

Even more searching in its utterance is this impulse of exultation, this adoration, jubel and outcry of soul to the One; wherein the individual discovers the end of conscious life and the true object of all might and truth, no less than glory and praise, as we meet it in many of the sublime psalms of the Old Testament. Take the words of the thirty-third psalm, for example:

“Rejoice in the Lord, O ye righteous, for praise is comely for the upright.

“Praise the Lord with harp: sing unto him with psaltery and an instrument of ten strings.

“Sing unto him a new song; play skilfully with a loud noise.

“For the word of the Lord is right; and all his works are done in truth.

“He loveth righteousness and judgment: the earth is full of the goodness of the Lord.

“By the word of the Lord were the heavens made; and all the host of them by the breath of his mouth.”[12]

Or take the twenty-ninth psalm: “Give unto the Lord, O ye mighty, give unto the Lord glory and strength.

“Give unto the Lord the honour due unto his name: worship the Lord in the beauty of holiness.

“The voice of the Lord is upon the waters: the God of glory thundereth: the Lord is upon great waters.

“The voice of the Lord is powerful, the voice of the Lord is full of majesty.

“The voice of the Lord breaketh the cedars; yea, the Lord breaketh the cedars of Lebanon.

“He maketh them to skip like a calf; Lebanon and Sirion like a young unicorn.

“The voice of the Lord divideth the flames of fire.

“The voice of the Lord shaketh the wilderness; the Lord shaketh the wilderness of Kadesh,” etc.

An exaltation and lyric sublimity such as the above contain a power of personal detachment,[13] and is consequently less adapted to self-absorbtion in the concrete content, wherein the imagination can lay hold of the fact in tranquil satisfaction. It is rather inclined to soar up in an indefinite enthusiasm, which strains to make present to feeling and perception what is unutterable for the intelligence. In this atmosphere of indeterminacy the individual soul is unable to envisage its unreachable object in quiescent beauty, or enjoy its self-expression in a work of art. Instead of a tranquil picture the imagination sets forth external phenomena without co-ordination and in fragments; and, inasmuch as it does not succeed with emotional effort in any consistent articulation of its separate ideas, in its positive artistic form, too, it employs a somewhat arbitrary and insurgent rhythm.

The *prophets*, who oppose the mass of the community, partly in the fundamental tones of grief and lamentation over the condition of their people, partly, too, in this feeling of alienation and decadence, carry to yet a further extreme this type of paranetic lyric in the sublime flame of their emotion and political indignation.

In a more modern age of imitation this sublime passion, however, is exchanged for a more artificial warmth, which easily cools and becomes abstract. Thus, for example, we have much hymn and psalm-writing of Klopstock, which possesses neither depth of thought, nor the tranquil development of any religious content whatever. What is expressed is, above all, an effort of this exaltation to the Infinite, which, agreeably with modern scientific ideas, merely discloses the empty incommeasurability and inconceivable might, greatness, and splendour of God, in its contrast to the very intelligible impotence and finitude of the poet.

(*β*) From a second point of view, we have those types of lyric poetry which may be described generally as odes, in the more modern meaning of the term. In these, as distinguished from the type above described, it is the *personal life* of the poet, in its independence, which asserts itself as a fundamental feature. It is, indeed, the culmination, which may be enforced in a twofold manner.

(*αα*) From one point of view the poet may, within this new mode of expression, select, as he previously did, a subjective matter itself of essential importance, such as the glory and celebration of gods, heroes, princes, love, beauty, art, friendship, and the like, while he displays his inner life as so completely steeped and carried away by this content and its concreteness, that it appears as though, in this impulse of enthusiasm, the subject has wholly mastered his soul, and is present in it now, as the one predominant power. If this was entirely so the facts which master him might

secure, in their independence, the plastic form, motion, and stability of an epic sculpturesque image.

Or, as a converse case, it is just the personal life of the poet himself and its greatness which he seeks to express and make real on its own account. As for the object itself, it is that whereof he makes himself master; he assimilates this in his own life, expresses himself in and through this. By so doing he freely and without reserve breaks up the more positive course of his subject with his own emotion or reflection; he illuminates it from within; he changes it; and the final result is that it is not so much the subject, but rather the *personal enthusiasm* in which it has steeped him, which is most effective. In this connection, however, we have two distinct aspects to consider. First, there is the compelling force of the subject-matter; secondly, we have that independent freedom of the poet which flashes into view in its conflict with that which would otherwise master it. It is above all the stress of this opposition, which renders inevitable the swing and the boldness of utterance and image, the apparent absence of order in the ideal construction and course of the poem, its digressions, *lacunae*, and sudden transitions, and which preserves the ideal elevation of the poet, by means of the mastery with which he is enabled, through the artistic perfection of his work, to overcome this disunion, and to produce an' essentially harmonious whole, which places him, as *his* work, in relief above the greatness of his subject.

It is to such a type of lyric enthusiasm that many of the Pindaric odes are referable, whose triumphant, albeit personal glory is disclosed in a mode of rhythm equally conspicuous for its varied movement, and yet for all that stringently regulated measure. Horace, on the contrary, more especially where he aims most at self-assertion, is rather lacking in warmth and insipid. We detect here an imitative artificiality, which vainly endeavours to conceal the purely technical preciosity of his composition. The enthusiasm

of Klopstock in the same way is never entirely genuine. It too frequently gives the impression of laboured artifice, despite the fact that many of his odes are rich in true and genuine emotion, and stamped with an engaging masculine worth and force of expression.

(*ββ*) From another point of view, however, it is not at all necessary that the content itself should be substantial or important. The poet is himself, in his own personality, of such weight that he can attach to even the more trifling objects worth, nobility, or at least in a general way a more exalted interest owing to the fact that they are embodied in his poetic work. Many of the Odes of Horace are of this type. Klopstock, too, with many another, may be included in such a category. In such cases it is not the importance of the material itself, which engages the poet's effort, but on the contrary that of the process in virtue of which he exalts what is on its own account insignificant, either in external facts or petty occurrences, to the height of the emotion and idea they excite in himself.

(*γ*) In conclusion, the entire infinite multiplicity of lyrical mood and reflection reaches its fullest compass in the sphere of the *song*, in which consequently differences of national custom and creative individuality have their freest play. Characteristics of every extreme of diversity meet together here, and the task of adequate classification is beset with difficulty. We will restrict ourselves to pointing out a few of the most general character.

(*αα*) We have, then, *first*, the *genuine song* intended for singing or purely musical practice,[14] whether in private or before others. Much intelligible content, ideal greatness and loftiness is not necessary. On the contrary, worth, nobility, weight of thought can only prove an obstacle to the desire of direct self-expression. Imposing ideas or reflections, or sublime emotions compel the artist to detach himself from his immediate personality and its interests. And yet it is precisely this immediacy of joy and sorrow, what we may call the unrestricted and momentary personal experience, which ought

to find its expression in the song. And it is on this account that every folk is in a peculiar way at home and at ease in its songs. Despite the unlimited variety of content and of melodic exposition that offers itself here, every song is without exception distinct from types previously considered by virtue of the simplicity of its subject-matter, movement, metre, verbal expression, and images. The point of departure is direct from the soul; the movement of inspiration is not so much from one object to another, but is, generally speaking, centered exclusively in one and the same content, whether it be a single emotional state, or any definite expression of delight or sorrow, that mood, in short, the effect of which carries the heart with it. In this emotion or temper the song persists with no interruption in its flight and impression, quietly and simply abiding therein without any strikingly bold contrast or transitions of idea; and it creates thereby in the even flow of its images this one perfected whole, sometimes without any interruption or disunion, at others in a more expansive and consequential survey, employing therewith rhythms adapted to song or the recurrence of rhymes easily intelligible and without any considerable complexity. Inasmuch, however, as it possesses for the most part as its content what is essentially transitory we are not to suppose that a nation is likely to sing the same songs over and over again, for a hundred or a thousand years. A people which can at all claim progressive development is neither so poor nor so so barren as only to possess poets of the song at one period of its life. It is just the poetry of the song, which, in contrast to the Epopaea, does not so much die as it is forever being awakened anew. This field of blossom starts up afresh every spring; and it is only in the case of oppressed peoples, peoples precluded from every advance, which are unable to experience the ever requickened delight in poetic composition, that the old and the oldest songs are retained. The particular song, just like the particular mood, arises, and then passes; it animates, delights, and is forgotten. Whoever knows or sings,

for example, the songs which fifty years ago were everywhere known and beloved? Every century strikes its own particular keynote; the previous one sounds out of tune, until it stops altogether. None the less, however, must every song possess not so much a revelation of the personality of the singer as a certain community of sentiment, which meets with response from all sides; which excites in others a like emotion and so, too, passes from mouth to mouth. Songs which are not generally current as such in their time are seldom of the genuine stamp. As an essential distinction in the composition of song I will merely emphasize two main aspects which I have already referred to. On the one hand the poet may express his inner life in its emotions quite openly and without reserve, more especially the feelings and state of joyfulness, and so that he communicates completely all that he experiences. On the other hand, and in extreme contrast to this, he may only suffer us to surmise through his very speechlessness, what is brought to a focus in the unopened chamber of his heart. The first type belongs mainly to the East, and more especially to the careless hilarity and contented expansiveness of Mohammedan poetry, the splendid outlook of which loves to dilate itself hither and thither in all the breadth of sensuous perception and witty conceit. The second type, on the contrary, applies with more force to our Northern self-concentration and intimacy of soul-life, which in its compressed tranquillity is often only able to seize hold of objects which are wholly external and to put suggestions in *them,* while the essentially suppressed spirit is unable to express itself or find a bent, but rather, like the child with whom that father in the Erl King rides through the night and the wind, dies away with its glow on the wick. The distinction above noticed applies also in a broader sense to other forms of lyrical composition such as the folk-song and more elaborate poetry; it recurs again in the simple song with many shades and intermediate links in its variety. With regard to

particular forms applicable to this class of composition I will restrict myself to the following examples.

We may mention, to start with, the *folk-song*, which, on account of its direct appeal, is mainly of the nature of the simple song, being also generally adapted to singing, or, rather, requiring the musical accompaniment. Its subject-matter is in part national exploit and event, in which the nation is emotionally made aware of and recalls again its most essential life; in part, too, feelings and situations are directly expressed which relate to particular classes. It associates, in short, civic life with its natural condition and its closest human relations, and it does so with every variety of note, whether of exultation or sorrow, which may duly harmonize with such. In contrast to the above, we have, secondly, songs of a more various and enriched culture, a culture which finds its entertainment in the companionable amusement of all kinds of pleasantry, graceful turns of phrase, casual occurrences, or polite modes of address, or, with more intensity of feeling, recurs to the pathos or necessities of less favoured conditions of life, describing therein both the facts and the consequent feelings they excite, the poet always making his appeal from his own breast and the facts of his own sympathetic experience. If such songs go no further than the bare narrative, more particularly of natural phenomena, the result is likely to be trivial and to betray the lack of imaginative resources. The bare description of emotional states, moreover, not unfrequently fares little better. The truth is that our poet in such descriptions, whether of objective facts or emotions, must not restrict his survey to the narrow outlook of direct wishes and desires, but must already in the freedom of his intelligence have raised himself into a more serene atmosphere wherein the main thing of importance to himself is the satisfaction which the exercise of his imagination has afforded. An undisturbed sense of freedom such as this, through expansion of heart and delight in conceptive idea on its own

account, confers on many songs of Anacreon, as also certain poems of Hafis and the Westöstliche Divan of Goethe the rarest charm of an unfettered creative gift.

There is a yet further type of composition of this general class, to which we must concede a more exalted or, at least, a more widely embracing content. The large majority of Protestant hymns composed for spiritual edification are essentially songs. They express the yearning after God, the plea for His grace, repentance, hope, trust, doubts, faith, and the like of the religious heart; no doubt, in the first instance, to meet the importunity of the individual soul, but at the same time in a manner of general significance, wherein such feelings and states of soul may or ought to apply, to a greater or less extent, to every member of the Christian Church.

(*ββ*) We may further return to another division of this class, the *sonnet, sestine, elegy, epistle*, and a few other such modes. These latter assert themselves as distinct from the ordinary sphere of song previously discussed. The immediacy of feeling and expression is emphasized in this class as a mediating bond with reflection, and a contemplation which, while remaining alert to many features of its subject, conceives the particular detail of perception and soul-experience under more general points of view. Science, learning, and, in short, a wide culture may be here effective; and if also in all the relations thus established the personal life, which connects and mediates in itself the particular fact with the general concept, is and remains the insistent and predominant factor, yet the standpoint presupposed is of a wider and more universal import than that of the ordinary song. The Italians in particular have given us splendid examples of a highly sensitive type of feeling and reflection in their sonnets and sestines. Such not only directly expresses in a given situation states of yearning, grief, longing, and the like, or the counterfeit of external objects, with a peculiarly intimate concentration, but includes many a diversion, many a

shrewd glance into mythology and history, whether past or present, while remaining throughout able to return upon itself, true to the fundamental demand of selfrestriction and concentration. The simplicity of the song is incompatible with a culture of this kind. The exalted character of the ode is equally disallowed. As a primary consequence of this the possibility of actual musical delivery vanishes; but, on the other hand, as some set-off to the absence of musical accompaniment, the verbal expression itself, in its sound and composed rhymes, becomes a melodic flow of speech. The Elegy, moreover, may, in the measure of its syllables, its meditation, its comments, and the descriptive display of emotional life, assume the form of the Epic.

(*γγ*) The *third* type of composition in this class is characterized by a mode of treatment which in recent times is most clearly represented among us Germans in the work of Schiller. The majority of his lyrical poems, such as those named by him Resignation, the Ideals, the realm of Shades, Artists, the Ideal and Life, are just as little songs in the true sense as they are odes or hymns, epistles, or elegies in the classic sense. Their position, on the contrary, is distinct from all these types. Their significance consists above all in the imposing fundamental thought of their content by the force of which, however, the poet neither appears to be carried away as a dithyrambic poet might be, nor in the press of his enthusiasm is there any appearance of conflict with the greatness of his subject. He remains rather throughout completely master of the same, and unfolds all that is therein implied from every point of view with his own poetic reflection. And he does this in the full impulse of genuine feeling, no less than with the comprehensive breadth of his intelligence, expressed with a compelling force in the most admirable and full-toned utterance and image, and yet, withal, for the most part in quite simple, if really arresting rhythms and rhymes. These great thoughts and fundamental interests, to which his entire

life was dedicate, appear consequently as the most intimate possession of his spirit. But he does not sing so much as one tranquilly self-absorbed,[15] or to a circle of companions, as the rich-songed mouth of Goethe was wont to do, but as a singer who delivers himself of what is on its own account intrinsically of worth in a storehouse of all that is most excellent and distinguished. His songs ring out, in fact, much as he says of his bell:

Hoch über'm niedern Erdenleben
Soll sie im blauen Himmelszelt,
Die Nachbarin des Donners, schweben
Und grenzen an die Sternen weit,
Soll eine Stimme seyn von oben,
Wie der Gestirne helle Schaar,
Die ihren Schöpfer wandelnd toben
Und führen das bekränzte Jahr.
Nur ewigen und ernsten Dingen
Sei ihr metall'ner Mund geweiht,
Und stündlich mit den schnellen Schwingen
Berühr' im Fluge sie die Zeit.[16]

3. HISTORICAL EVOLUTION OF THE LYRIC.

It will already have sufficiently appeared from what I have pointed out in relation to the general character, as also the more detailed features discussed with reference to the poet, the lyrical composition and the several types of the art that to a singular degree in this province of poetry a concrete treatment is only possible which accepts the historical narrative as a constituent feature. The universal, which can be set forth in its independence, does not merely remain restricted in its compass, but is also abstract in its valid worth. And this is so because in no other art to the like

extent does the particularity of the time, condition, and nationality, no less than the specific idiosyncracy of individual genius, supply the determinating factor of the content and form of the artistic product. But in proportion as the strength of the demand forces itself on our attention that such an historical exposition should be avoided, I feel myself obliged, in the interests of the very variety of material comprised in the embrace of lyric composition, to limit myself exclusively to a very partial survey of all that I am acquainted of in this particular class of work, and in which my lively interest could have been extended.

As the basis of our general classification of the varied national and more personal lyric compositions, as in the case of epic poetry, we cannot do better than follow the order of those radical types under which artistic creation generally is unfolded, and which we now know as symbolic, classic, and romantic art. As the main division, therefore, of our present subject-matter, we may, in other words, adopt a similar sequence from Oriental compositions to the Lyric of the Greeks and Romans, and then from this to the Slavonic, Romance, and German peoples.

(*a*) Taking, then, the Oriental lyric first, we may observe that it differs essentially from the lyrical composition of the West through its inability to attach to it the independent personality and free spirit of the poet, or that unity which characterizes every content of romantic art, its essential infinity, reflecting, in fact, the potential depth of the romantic soul. Such a distinction is only in keeping with the universal principle of the East. The individual conscious life is here, referably to its content, directly absorbed in the detail of external fact, expressing itself under the condition and specific relations of this inseparable unity. And, from a further point of view, it asserts itself, without being able to secure a firm ground of stability in itself, as opposed to what it conceives to be of potency and substance in Nature and the conditions of human existence, which it wrestles to reach

whether through emotion or imagination, at one time situated towards it rather in the relation of pure opposition, at another with more freedom, but in either case with ultimate failure. What we find here, therefore, if we confine our attention to *form*, is not so much the poetic expression of independent ideas over objects or their connections, as it is the bare mirror of this unreflecting absorption,[17] wherein the individual consciousness does not disclose itself in its own self-concentration as free personality,[18] but rather in its self-annulment[19] before the external object or condition. Thus regarded, the Oriental lyric frequently, particularly in its contrast to the romantic, assumes a more objective tone. Here we shall often enough find that the poet does not so much express facts and conditions as they affect him, but rather as they are in themselves, a disclosure which frequently bestows on them an independent soul of vitality of their own. For illustration we may take that exclamation of Hafis:

"Come, O come! The nightingale passeth from the soul of Hafis once again over the scent of the roses of delight."

Regarded in another light, the tendency of this lyrical poetry, by freeing the poet from the limitations of his private individuality, is to replace this with a kind of primitive expansion of soul, which, however, very easily loses itself in mere boundlessness, or is merged in a deliberate effort to express that which it accepts as object but cannot fully penetrate, because this content is itself the formless substance. For this reason, speaking generally, the lyric of the East, more especially among the Hebrews, Arabs, and Persians, possesses the character of hymns of exaltation. With spendthrift prodigality all greatness, might, and glory are lavished upon the creature, in order to make all such transitory splendour vanish before the unspeakable majesty of God; or, at least, it never is tired of stringing together in some precious chain everything that is lovable or fair, in order to present the same as a thankoffering to the object, be it Sultan, the beloved,

or the wine-shop, which the poet has set himself above all things to celebrate.

In conclusion, if we look more closely at form of expression in this type of poetry, we shall find that it is mainly the *metaphor*, the *image*, and the *simile* which are favoured. For, in the first place, on account of the fact that he is not himself wholly free to express his own personal life, the poet can only disclose himself in something else, something external to himself, with the aid of life that can compare with himself. And also we may observe that what is here universal and substantive remains abstract; that is to say, it is unable to merge itself in the definite form of a free individuality, so that now, even on its own account, it is only in comparisons with the varied phenomena of the world that it is able to envisage itself; and we may add that both these cases, in the last instance, only possess the worth of being able to assist some comparable approach to that One which alone possesses significance, and is worthy of honour and praise. These metaphors, images, and similes, however, in which the individual soul, as it asserts itself, is exclusively identified almost to the point of visibility, are not the actual feeling and spiritual state itself, but rather a mode of expression which is wholly personal and of the poet's composition. What, therefore, the lyrical artist here loses in the concreteness of his spiritual freedom, this we find is replaced by the freedom of his expression, which moves forward through all the most manifold phases; that is, from the naïve simplicity of its images and similes to every conceivable audacity and the acutest ingenuity of novel and surprising combinations. As regards particular nations in which we find this Oriental type of lyric represented, we may mention, first, the Chinese; secondly, the Hindoos; thirdly, and to a pre-eminent degree, the Hebrews, Arabs, and Persians. I cannot, however, enter into any closer description of these.

(*b*) In the case of the second principal division of our present poetic type, that is in the Lyric of the Greeks and Romans, it is the principle of *classic* individuality which, above all, distinguishes its character. In accordance with this principle, the artistic consciousness, which seeks for lyrical expression, neither loses itself in the facts of the natural world, nor exalts itself over itself to the height of that Sublime outcry to all creation: "Let all that hath breath praise the Lord!" Nor is it absorbed, after divesting itself joyfully from all the bonds of finite existence, in that One Being in which all live and move. Rather the poet here is freely merged in the Universal, regarded as the very substance of his own spirit; and in this personal union within himself attains his self-conscious poetic activity.

And just as the Lyric of the Greeks and Romans is distinct from that of the *Orientals*, so too, from another point of view, it differs from the *romantic*. In other words, instead of unveiling its depths in the intimacy of particular moods and states of feeling, it rather elaborates, to the point of the most explicit definition, this inward life of its individual passion and meditation. And by doing so it even retains, even as the expression of this inward spirit, so far as this is permitted to the Lyric, the plastic type of classic art. All that it communicates, in short, of the views and maxims of life and wisdom, despite all the penetration of its general principle, nevertheless does not dispense with the free individuality of independent thought and conception. It expresses itself less in the wealth of image and metaphor, than directly and categorically. At the same time, also, the personal feeling, at one time in more general relations, at another in the form of vision itself, is on its own account objective. In the same mode of individuality the particular types may be classified as distinct from each other in conception, expression, phraseology, and verse-measure, until they reach the culminating point of their independent elaboration. And as we have found it true of the soul itself and its ideas, so, too, the external

presentment is of more plastic type. In other words, from a musical point or view, it emphasizes less the ideal soul-melody of emotion than the sensuous verbal quantity in the rhythmical measure of its movement, to which it may further attach the complex mazes of the dance.

(α) With the richest originality this artistic form of Greek lyric poetry is perfected. In the first instance we may trace it in those *hymns* possessing a content as yet more akin to the epic mode, which do not so much express in their epic metre a personal enthusiasm as they set before us a plastic image of gods in deliberately objective outlines. The next step, so far as metre is concerned, we mark in the *elegiac* syllabic measure, which associates the pentameter with the hexameter, which, in the regular recurrence of its ending after the hexameter, and with its two equally divided sections, opens the way to the complete singularity of the verse strophe. The elegy is also throughout in its tone of the lyric type. This is so in the case of the political elegy no less than the erotic, although, particularly as gnomic elegy, it still closely approaches the epic insistence upon and expression of the substantive as such, and for this reason almost exclusively belongs to the Ionians, with whom the objective point of view was generally predominant. In respect also to its musical side, it is primarily the aspect of rhythm which is here successfully worked out. And, on parallel lines with it, we may observe, thirdly, the development of the *Iambic* poem in a novel verse-measure. This, however, is, by reason of the keenness of its invectives, from the first of a more subjective or personal tendency. The genuine mode of lyrical reflection and passion, however, receives for the first time its full development in the so-called *Melisian*[20] lyric. The metres are more varied, more capable of change; the strophes are more rich; the suggestions of musical accompaniment are more complete in virtue of the nature of the accepted modulation. Each poet creates a syllabic measure which corresponds with his or her lyrical nature. Thus Sappho adapts one to a type

of composition which is sensuous, inspired with the glow of passion and expressed with an effect which works up to a supreme crisis. Alcaeus moulds one in harmony with his masculine and bolder odes. To an exceptional degree, too, the Scoliasts supply many indications of the finer nuances of diction and metre by reason of the variety of their content and melodic utterance.

Last of all, the lyric of the *chorus* is richest of all in the wealth of what it unfolds, and not merely so in what concerns idea and thought, boldness of transition and connection or the like, but also relatively to its external presentment. The choral song may be interchanged for the single voice, and the ideal movement is not merely satisfied with the bare rhythm of speech and the modulations of music, but summons as its associate the plastic pose and movement of the dance. The ideal aspect of the Lyric is consequently balanced to perfection with the sensuous character of its delivery. The subject-matter of this type of inspired verse is the most substantive and weighty. Such poems celebrate the power and glory of the gods, or that of victors in the games. Greeks, who not unfrequently were divided in their political relations, found in them the positive vision of their national unity. And, partly for this reason, aspects of their ideal construction are not wanting which approach the objective standpoint of the Epic. Pindar, for example, who reaches the highest point of attainment in this type of composition, moves with ease, as I have already pointed out, from the external motives of his compositions to profound observations upon the general nature of ethical principle and divine matters, or it may be upon heroes, heroic exploit, the foundations of States, and the like. His creative gift possesses, in short, the plastic sense of realization quite as much as the individual sweep of imaginative energy. On this very account, however, it is not so much the facts which follow their independent course in the epic

manner, as the personal enthusiasm, carried away by its object so completely that the latter appears to be the burden and product of the soul.

Later lyric verse of the Alexandrines is less an independent development and more a mere scholastic imitation and affectation of elegance and correctness of expression, until finally it dissipates itself in trifling graces and pleasantries, or seeks to bind up afresh flowers of art and life already to hand in a garland of tender feeling and conceit, and the witty experiment of eulogy or satire.

(*β*) Among the Romans lyric poetry finds a soil no doubt fashioned for it in various ways, but of less original productive qualities. The period of its splendour is limited mainly to the age of Augustus, in which it is cultivated as the elaborate expression and relaxation of cultured society; or indeed, to a considerable degree, it is rather an affair of the clever translator or copyist, and the fruit of taste and research, than that of spontaneous feeling and really original conception. At the same time it must be admitted that, despite the learning and an alien mythology, to say nothing of the preferred imitation of Alexandrine models, where the warmth of life is least apparent, yet as a rule the characteristics of Roman personality no less than the individual genius of particular poets, do assert an independent position, and, so long as we put entirely on one side the most intimate soul and expression of the art of poetry, have accomplished sterling and consummate results, not merely in the province of the ode, but also in that of epistles, satires, and elegy. On the other hand, the later type of satire, which follows as a kind of supplement, in its bitterness toward the decadence of the times, its goaded indignation and virtuous declamation, fails to represent the genuine sphere of an unperturbed poetical vision just in the degree that it possesses nothing whatever to oppose to its picture of a demoralized present save this very indignation and abstract rhetoric of virtuous excitement.

(*c*) For this reason, consequently, it is only after more modern nationalities have appeared that a really original content and spirit are communicated to lyrical composition, as we have previously seen, was the case, too, with the Epic. This is due to the German, Romance, and Slavonic peoples, which already, in their previous pagan days, but principally after their conversion to Christianity, both in the Middle Ages and in more recent times, have brought into being, and continuously elaborated in various ways, a *third* fundamental revival of lyrical creation in what we may generally characterize as the *romantic* art-type.

In this third branch of its activity, lyric poetry is of so overwhelming an importance that its principle is enforced, more — especially in the first instance, relatively to the Epos, but consequently in its more modern development and relatively to the drama, with a far profounder significance than was possible with either Greek or Roman. Indeed, among certain nations, even genuine epic materials are treated exclusively under the type of the lyric narrative; in this way we have compositions as to which we may find real difficulty in deciding the class to which they more truly belong. The cause of this conspicuous tendency towards lyric composition is mainly due to the fact that the entire evolution of the life of these nations is based on this very principle of subjectivity, which is constrained to assert and clothe what is substantive and objective as its own from its own resources, and grows more and more self-conscious of this penetration into its own personal wealth. Such a principle declares its vigour in its least perturbed and most complete character among the German peoples. The Slavonic races have, on the contrary, first to wrestle forth from the Oriental absorption in the substantive One and Universal. Between the two we may place the Romance stock, which are confronted, in the conquered provinces of the Roman Empire, not merely with the residue of Roman science and culture, but a social system more elaborate from every point of view. In the

process of self-fusion with such conditions, they inevitably lose a part of their original character. As for the subject-matter of this poetry, we may describe it as dealing with pretty nearly every phase of national or individual development, capable of expressing either the religious or secular life of these nations as it expands in ever widening range, and through the process of the centuries reflects in varied condition and emotional state the heart of its spiritual substance. And the fundamental type of it is either the expression of an emotional state, concentrated to the most intimate self-possession, whether the immediate object of attraction be national and other events, Nature and external environment, or simply and solely itself, or whether it be of the nature of reflection, both searching and self-introspective, upon all that is implied for itself in such an extension of culture. Regarded on its formal side, the plastic character of rhythmical versification is exchanged for the music of alliteration, assonance, and manifold alternations of rhyme. These novel elements it makes use of sometimes in a quite simple and unassuming manner; in other connections with much art and invention of modes of versification wholly distinct in character. At the same time the external delivery becomes increasingly more elaborate in its powers of adaptation to the accompaniment of vocal and instrumental music.

In our classification of the extensive compass of this group, we cannot do better than follow that we accepted in the case of epic poetry.

Firsts we have the lyric composition of these modern nations while still in the state of primitive paganism.

Secondly, there is the richer development of this type in the Christian Middle Ages.

Thirdly, there is that lyric art based in some measure on the reawakened study of ancient art, and in part on the fundamental principle of modern Protestantism, a principle essential to its final elaboration.

In the present work, however, I shall be unable to discuss with more detail the characteristics of the above development. I will, by way of conclusion, merely draw attention to one German poet, whose influence has given in modern times a quite extraordinary impetus to the lyric poetry of our own fatherland, and whose services in this respect are by no means appreciated by contemporary criticism as they deserve to be. I refer to the poet of the Messias. Klopstock is among the great Germans, who have inaugurated the new artistic epoch of their people. He is a great figure, who, by means of courageous enthusiasm and superb self-respect, wrested our poetry from the stupendous insignificance of the Gottsched[21] period, which with its blockish superficiality had completely destroyed the life of all that is noble and of worth in the genius of our race; who has, in short, given us poems fully awake to the highest demand of the poet's vocation, in a form of thorough artistic excellence, if also somewhat austere, the majority of which are stamped with the permanency of a classic. Some of the odes of his youth are dedicated to a generous *friendship*, which was to him at once symbolic of nobility, staunchness, honour, the pride of his soul, a temple of his spirit. Others have reference to a *personal* attachment of real emotional depth, although it is precisely in this field that we meet with many compositions which a critical sense can only regard as so much prose. "Selmar and Selma" is a poem of this class, a gloomy and tedious altercation between lovers, which, not without many tears, woe, empty yearning, and useless feats of melancholy emotion, revolves round the one mouldy and musty question, which of the two, Selmar or Selma, is first to die. But in Klopstock we find at least a genuine impulse of patriotism alive in every pore. As a good Protestant the Christian mythology, with its sacred legends and so forth — we must except the angels, for whom he retained as a poet a profound respect, although they can only appear abstract and lifeless in a type of poetry such as his, which claimed the realism of life —

neither satisfied his sense of the ethical seriousness of art, nor yet the vigour of life and an intelligence, which aspired to something more than blind wailing and self-abasement, was, in short, both self-respecting and actively religious. The need of some mythology, however, and one connected with Germany impressed him strongly as a poet, in order that he might have definite names and characters ready to hand as a stable basis of his imaginative creation. It is impossible to associate such patriotic sentiments with the gods of Greece. Consequently Klopstock attempted, we may justly say from genuine national pride, to give a renewed life to the old mythology of Wodan, Hertha and the rest. He was unfortunately as little able to carry his aim to the point of objective effect and sufficiency by this adoption of names of gods, which are no longer really Germanic, however much they may have been so, as, let us say, the imperial museum in Regensburg is qualified to stand for the ideal of our present political life. However strongly, then, he may have felt the need to be able to realize in poetry and as fact in a national form a general folk-mythology, the truth of Nature and conscious life, these twilight gods remain entirely devoid of essential truth; we may add there is a kind of childish self-flattery in the belief that either reasonable people or the national faith could take such an attempt seriously. Apart from this, as objects of interest to the imagination, the figures of Greek mythology are elaborated in ways with incomparably more variety, infinitely stronger appeal to our aesthetic taste, our sense of delight and freedom. In lyric poetry, however, it is the self-revelation of the poet that is all-important. We ought at least to honour in our patriotic poet this his solicitude and effort, an effort which was sufficiently effective to bear subsequent fruit, and, even in the field of poetry, to stimulate by its suggestion composition on similar subjects. We have, however, to conclude our review, no word to say against the purity, excellence, and admirable influence of this patriotic sentiment of Klopstock as expressed in his

enthusiasm for the honour and value of our German speech, and certain characters of our former history, that of Herrmann, for example, and above all particular German Kaisers, who in some instances have even been self-celebrated in song. Vital in him throughout is his justifiable pride in the German muse, and his faith in her increasing courage to contend on equal terms and in high-spirited self-reliance with that of the Greek, the Roman, and the Englishman. And no less a genuine reflection of his patriotism is the nature of his survey of the royal princes of Germany, the expectations which their character have or had it in their power to arouse on all that generally concerns honour, art, and science, questions of public import and spiritual objects of essential value. On the one hand we find him expressing his contempt of our princes, who, as he tells us, remain on their comfortable chairs, surrounded with the tobacco smoke of courtiers, buried in present obscurity and yet deeper to be buried in the future. Or he may express his feelings in the lament that even Frederick II

Nicht sah, dass Deutschland's Dichtkunst sich schnell erhob,
Aus fester Wurzel daurendem Stamm, und weit,
Der Æste Schalten wurf![22]

With pain of a like quality those vain hopes, too, return back to him, in which he saw in Kaiser Joseph the uprise of a new world of spiritual effort and poetry. And, finally, it is an honour to the heart of the old veteran at least as great that he sympathizes with the present fact that a people had shattered its fetters of every kind, had trodden under foot the injustice of a thousand years, and for the first time sought to found its political life on reason and right.

He greets this new

Labende, selbst nicht geträumte Sonne.
Geseegnet sei mir du, das mein Haupt bedeckt,
Mein graues Haar, die Kraft, die nach sechzigen
Fortdauert; denn sie war's, so weithin
Brachte sie mich, dass diess Erlebte![23]

Nay, he will even express his gratitude to France:[24]

Verzeiht, O Franken (Namen der Bruder ist
Der edle Name) dass ich den Deutschen einst
Zurufte, das zu fliehen, warum ich
Ihnen jetzt flehe, euch nachzuahmen.

And, naturally, the acerbation of the poet was all the more bitter, when this fair dawn of freedom changed to a day that was steeped in horror and blood, one that murdered liberty. Klopstock, however, was unable to give poetical expression to such painful feelings. What he did find the opportunity to say was all the more prosaic, without definite structure and logical consequence on account of the fact that he had no higher purpose,[25] veiled in such facts, to set off against his disappointed hope. His genius was in short entirely blind to any more profound demand of reason in the facts of such a revolution.

The greatness of Klopstock consists then essentially in his national sympathies, his keen sense of freedom, friendship, love, and his staunch Protestantism. We may justly honour him for his noble character and his noble art, for his effort and achievement. And if, too, in many directions he shares the limitations of his own times, and in truth is responsible for many odes that are solely of interest to the critic, the grammarian, the metrist, odes deficient in all poetic vitality, we may affirm, nevertheless, that with the single exception of Schiller, we shall find in our subsequent literature no

more noble figure, no disposition of such serious and masculine independence.

We have, indeed, to compare with him Schiller and Goethe, who are not merely the poetic exponents of their own times in a spirit resembling his own, but in their experience as poets are of course far more comprehensive. And, above all, in the songs of Goethe we Germans unquestionably possess the most consummate, profound, and influential poetic compositions of modern times. If they are wholly an expression of the poet they are equally the treasure of his people; and, in fact, as the genuine growth of his native soil, are completely in accord with the fundamental tones of our national life and genius.

[1] *Subjectivität.* Individual self-conscious life.

[2] *Das Subject*, here the individual consciousness which composes.

[3] *Ergusses,* the pouring out into a mould.

[4] Vol. iv, pp. 169-172.

[5] This appears to be the meaning of the words *die letzte Music eines nationalen Inneren.*

[6] I presume by *Nachhülfe* Hegel practically means imitation rather than translation. It may be very much doubted whether any composition, involving a change of language, can give anything but the faintest knowledge of the original folk-song. Goethe's genius could produce poetry out of strange materials, but he could not reproduce the music of another medium.

[7] *Subjektiver Art*.

[8] Or as the text runs, "and as everybody's poet."

[9] Pausanias, I, c. 8.

[10] Æschines, ep. 4.

[11] *Zusammengezogenheit.* The idea of concentration is also present.

[12] I have taken the revised translation.

[13] *Äussersichseyn.* The being beside or aloof from oneself, not so much in the sense of infatuation as ecstasy.

[14] I presume Hegel means this by the words *nur zum Trällern*; it might mean "merely to be hummed."

[15] *Still in sich*.

[16] High above the life of earth beneath it shall wave in the blue band of heaven, neighbour to the thunder, on the boundary of the starry world. It shall be a voice from above, ay, as the bright choir of the stars, who praise their Creator in their motion and conduct the garlanded year. Its voice of bronze is dedicate to eternal and earnest matters alone, and, hour by hour, as it swiftly swings backwards and forwards, it is one with Time in its flight.

[17] *Einlebung.* This vital fusion with the object.

[18] *In seiner in sich Zurückgenommenen Innerlichkeit*.

[19] *In seinem Aufgehohenseyn.*

[20] That is, of the isle of Melos, Sappho's birthplace.

[21] Readers of the Xenien of Goethe and Schiller will recall the unsparing attacks which were directed against this formalist and pedant.

[22] Even Frederick II "did not see that the art of German poesy was raising itself swift on high from the enduring stock of a stable root, and spread the shade of its branches far abroad."

[23] He greets this new "reawakened sun, no mere dream at least of mine. Verily I bless thee, who sweepest over my head, my grey hairs, the strength of me that still endures after its sixty years. Ay, for was it not this strength which has carried me so far to see this very vision!"

[24] "Forgive me, brother of France, and brotherhood is the noblest tie after all, that I once cried to my Germans to flee from that, which I now implore them to follow — imitation of you." The reference is

of course to the French Revolution.

[25] Hegel may mean that Klopstock was unable to see the real benefits which would result from the French Revolution despite its apparent failure. The sentence which follows would, however, suggest an alternative interpretation that the poet was unable to see the higher demand which the facts of Revolution made upon the French people, and which from the first, that is, even when Klopstock admired them, they did not either frankly face or successfully respond to. I think, indeed, this latter is most probable.

C. DRAMATIC POETRY

The reason that dramatic poetry must be regarded as the highest phase of the art of poetry, and, indeed, of every kind of art, is due to the fact that it is elaborated, both in form and substance, in a whole — that is the most complete. For in contrast to every other sort of sensuous *materia*, whether it be stone, wood, colour, or tone, that of human speech is the only medium fully adequate to the presentation of spiritual life; and further, among the particular types of the art of articulate speech, dramatic poetry is the one, in which we find the objective character of the Epos essentially united to the subjective principle of the Lyric. In other words it presents directly before our vision an essentially independent action as a definite fact, which does not merely originate from the personal life of character under the process of self-realization, but receives its determinate form as the result of the substantive interaction in concrete life of ideal intention, many individuals and collisions. This mediated form of epic art by means of the intimate personal life of an individual viewed in the very presence of his activity does not, however, permit the drama to describe the external aspects of local condition and environment, nor yet the action and event itself in the way that they are so described in the epic. Consequently, in order that the entire

art-product may receive the full animation of life, we require its complete scenic representation. And, finally, the action itself, regarded in the full complexus of its ideal and external reality, is adapted to two distinct types of composition of the most opposite character, the predominant principles of which, regarded severally as the tragic and comic type, create in their turn also a further fundamental and specific point of view in our attitude to the dramatic art.

Starting then from the vantage of these general observations we may indicate the course of our inquiry as follows:

Firsts we propose to consider the dramatic composition, both in its general and more detailed features, in the contrast it presents to epic and lyrical poetry.

Secondly, our attention will be directed to its scenic presentation and the conditions of this necessity.

Thirdly, we shall pass under review the different types of dramatic poetry as we find them realized in the concrete facts of past history.

1. THE DRAMA AS A POETICAL ART-PRODUCT

What we have, in the first instance, to define more emphatically is the poetic aspect of the dramatic composition as such, that is to say in its independence of the fact that the same is necessarily presented to our direct vision on the stage. Our investigation of this will do well to concentrate itself on the following points:

Firsts there is the general principle of dramatic poetry.

Secondly, we have the several specific types of dramatic composition.

Thirdly, there is the relation which obtains between these and the public audience.

(*a*) *The Principle of Dramatic Poetry*

The demand of the drama, in the widest sense, is the presentation of human actions and relations in their actually visible form to the imaginative consciousness, that is to say, in the uttered speech of living persons, who in this way give expression to their action. Dramatic action, however, is not confined to the simple and undisturbed execution of a definite purpose, but depends throughout on conditions of collision, human passion and characters, and leads therefore to actions and reactions, which in their turn call for some further resolution of conflict and disruption. What we have consequently before us are definite ends individualized in living personalities and situations pregnant with conflict; we see these as they are asserted and maintained, as they work in co-operation or opposition — all in a momentary and kaleidoscopic interchange of expression — and along with this, too, the final result presupposed and issuing from the entirety of this interthreading and conflicting skein of human life, movement, and accomplishment, which has none the less to work out its tranquil resolution. The mode of poetical composition adapted to this novel type of content can be, as already suggested, no other than a mediating union of the principles of epic and lyrical art respectively.

(α) The *first* point of importance we have to settle to our satisfaction is that of the *time* at which dramatic poetry is able to assert itself in all its predominance. Drama is the product of an already essentially cultured condition of national life. It already presupposes as essentially a feature of past history not only the primitive poetic period of the genuine Epos, but also the independent personal excogitation of lyrical rapture. The bare fact that, while combining these two points of view, it is satisfied with neither sphere in its separation proves that this is so. And in order that we may have this poetic combination the free self-consciousness of human aims, developments and destinies must be already fully alert and awake, must have attained, in short, a degree of culture such as is only possible in the

intermediate and later epochs of a nation's development. For this reason, too, the greatest exploits and events of a nation's primitive history are rather of an epic than a dramatic type. Such are features of the national existence for the most part related to communities outside it, such as the Trojan war, or the wave of popular migration, as illustrated in the Crusades, or the national resistance to a common enemy, as was the case in the war of Greece against Persia. It is only at a later stage that we meet with the more stable independence of single heroes, who create for themselves and out of themselves in their isolation definite ends, and carry through the undertakings they imply.

(*β*) We may add the following remarks upon the nature of this *mediation* between the opposed principles of *epic* and *lyric poetry.*

The Epos already makes an action visible to our imaginative sense. It is, however, here presented as the substantive entirety of a national spirit under the form of definite events and exploits of external life, in which personal volition, the individual aim and the externality of vital conditions, together with the obstructions which such external facts present, are retained in an equal balance. In the Lyric, on the contrary, it is the individual person, which is emphasized in the independence of his subjective life and as such expressed.

(*αα*) In combining these two points of view drama has in the *first* place, following in this respect the Epos, to bring before our vision an event, action, or practical affair. But above all in everything that is thus presented the factor of bare externality must be obliterated, and in, its place the self-conscious and active personality is posited as the paramount ground and vital force. The drama, in short, does not take exclusive refuge in-the lyric presence of soul-life, as such stands in contrast to an external world, but propounds such a life in and through *its* external realization. And in virtue of this the event does not appear to proceed from external conditions, but

rather from personal volition and character; it receives in fact its dramatic significance exclusively in its relation to subjective aims and passions. At the same time the individual is not left exclusively rooted in his self-exclusive independence; he comes to his own through the peculiar nature of the conditions in which he is placed, and subject to which his character and purpose become the content of his volitional faculty, quite as much so in fact as in virtue of the nature of the particular purpose itself in its opposition to and conflict with other ends. Consequently the dramatic action in question must submit to a process of development and collision with other forces, which themselves, on their own account, and even in a contrary direction to that willed and intended by the active personality, effect the ultimate course of the events through which the personal factor, in its essential, characteristics of human purpose, personality, and spiritual conflict, is asserted. This substantive or objective aspect, which is enforced along with the individual character, in other respects acting independently from its own ideal resources, is no other than the very point of view which we find effective and vital in the principle of dramatic poetry, when it coincides with that of the epic composition.

(*ββ*) However much, therefore, we may have as a centre of attraction the intimate soul-life of particular men and women, nevertheless dramatic composition cannot rest content with the purely lyrical conditions of the emotional life; nor can the poet of such merely limit his sympathy to the dusty record of exploits that are already complete, or, speaking generally, merely describe the experience of enjoyment or other states of emotional or contemplative life. The drama, on the contrary, has to exhibit situations and the spiritual atmosphere that belongs to them as definitely motived by the individual character, which is charged with specific aims, and which makes these an effective part of the practical content of its volitional self-identity. The definition of soul-life, therefore, in the drama passes into the sphere of

impulse, the realization of personality by means of active volition, in a word, effective action; it passes out of the sphere of pure ideality, it makes itself an object of the outer world, and inclines itself to the concrete facts of the epic world. The external phenomenon, however, instead of attaining existence in the bare fact of an event, is here, in the view of the acting character himself, charged with the opinions and aims he forms on his own account. Action is here the executed will, which as such is at the same time *recognized*, recognized, that is, not merely in its origin and point of departure from the soul-life, but also in respect to its ultimate purpose. In other words, all that issues from the action, issues, so far as the personality in question is concerned, from himself, and reacts thereby on his personal character and its circumstances. This constant relation of the entire complexus of external condition to the soul-life itself of the self-realized and self-realizing individuality, who is at once the basis and assimilating force of the entire process, marks the point where dramatic poetry falls in line with the truly lyrical principle.

(*γγ*) It is only when thus regarded that human action asserts itself as *action* in the supreme sense, that is, as actual execution of ideal intentions and aims with the realization of which the individual agent associates himself as with himself, discovers himself and his satisfaction therein, and thereupon further takes his stand with his entire being in all that proceeds from it as a constituent of the objective world. A character which is dramatic plucks for himself the fruit of his own deeds.

Inasmuch, however, as the interest, in a dramatic sense, restricts itself to the personal aim, whose hero the active personality is, and it is only necessary in the artistic work to borrow from the external world so much as is bound in an essential relation to this purpose, which originates in self-conscious life, for this reason the drama is *primarily* of a more abstract nature than the epic poem. For on the one hand the action, in so far as it

reposes in the self-determination of character, and is deducible from this vital source and centre, does not presuppose the epic background of an entire world through all the varied aspects and ramifications of its positive realization, but is concentrated in the simpler definition of circumstance subject to which the individual man is absorbed in his immediate purpose and carries the same to accomplishment. And from a further point of view we have not here the type of personality which asserts its development to our vision in the *entire complexity* of national qualities as such are displayed by the epic, but rather character viewed in *direct* relation to its action, character which possesses a *definite* end directed to spirit life in its universality. This end or purpose, this eventual fact on which it depends, is placed in a more exalted position than is possible to the extension of the purely individual life, which appears inclusively as living organ and animating vehicle of the same. A more widely extended unveiling of character under the most varied aspects which are present either in no connection at all or only in a more remote one to its action, as we find it concentrated on *one* single point of interest would be a superfluity; consequently in this respect, too, that is, in its relation to the active personality, dramatic poetry ought to be more simply concentrated than epic poetry. The same generalization is applicable to the number and variety of the characters represented. For in virtue of the fact, as previously insisted, that the movement of the drama is not thrown upon the background of a national existence essentially complete in its envisagement of every conceivable variety of class, age, sex, activity, and so forth, but on the contrary, rivets our attention throughout on *one* fundamental purpose and its achievement, a realization of objective fact so extended and intricate as this would not merely be ineffective, but would actually impair the result proposed. At the same time, however, and *secondly*, the end and content of an action is only dramatic by reason of the fact that on account of its

defined character, in the distinctive qualities of which the particular personality itself can alone lay hold of it under equally definite conditions, it calls into being in other individuals other objects and passions opposed to it, This pathetic excitant[1] may, no doubt, in each separate active agent, assume the form of spiritual, ethical, and divine forces, such as duty, love to fatherland, parents, wife, relations, and the like. If, however, this essential content of human feeling and activity is to assert itself as dramatic it must in its specialization *confront* us as distinct ends, so that in every case the action will inevitably meet with obstruction in its relation to other active individuals, and fall into subjection to changing conditions and contradictions, which alternately prejudice the success of their own particular fulfilment. The genuine content, the essential operative energy throughout may therefore very well be the eternal forces, the essentially explicit ethical State, the gods of vital reality, in a word the divine and the true, but it is not these in the might of their tranquillity, in that condition, so to speak, wherein the unmoved gods abide, saved from all action, as some serene figures of sculpture self-absorbed in a state of blessedness. What we have here is the divine in its community, as content, that is, and object of human personality, as concrete existence in its realization,[2] invited to act and charged with movement.

If, however, as above described, the godlike presence constitutes the most vital objective truth in the external precipitate[3] of human action, then, *thirdly*, the deciding factor in the course and original departure of such an evolution and conflict cannot reside with particular individuals, which are placed in a relation of opposition to one another; it must be referred to the divine presence itself, regarded as essential totality: and for this reason, the drama, it matters not in what form it may be shaped, will have to propound to us the vital energy of a principle of Necessity which is essentially self-supporting, and capable of resolving every conflict and contradiction.

(*γ*) Consequently, we have before everything else the demand made on the dramatic *poet* in his creative capacity, that to the fullest extent his intelligence is awake to that ideal and universal substance which is at the root of human ends, conflicts, and destinies. He must fully acquaint himself with all the contradictions and developments which the particular action will, under the proposed conditions, necessarily involve and display. He must not merely be aware of them in so far as they originate in personal passion and the specific characterization of particular individuals, or as he finds such related to the actual content of human designs and resolves; but also in so far as they are simply referable to the external relations and circumstances of concrete life. And, along with this, it should be within his powers to recognize what the real nature of these paramount forces are, which apportion to man the just guerdon of his achievements. The rightful claim, no less than the wrongful misuse of the passions, which storm through the human heart, and excite to action, must lie disclosed to him with equal clarity, in order that precisely in those cases where the ordinary vision can only discover the ascendancy of obscurity, chance, and confusion, he, at least, will find revealed the actual selfaccomplishment of what is the essence of reason and truth itself. It follows, therefore, that the dramatic poet ought as little to confine his efforts to the indefinite exploration of the depths of emotional life, as the one-sided retention of any single exclusive mood of soul-life, or any limited partiality in the type of his sense-perception and spiritual outlook generally. He ought, rather, to exclude nothing from his vision that may be embraced by the widest expansion of Spirit conceivable. And this is so because the spiritual powers which are exclusively distinct in the mythological Epos, and which, by virtue of the many-sided aspects of *actual individualization*[4]tend to lose the *clear definition* of their significance, assert themselves in dramatic poetry in consonance with their simple substantive content as pathos altogether, and

as apart from individual characters. The drama is, in fact, the resolution of the one-sided aspect of these powers, which discover their self-stability in the dramatic character. And this is so whether, as in tragedy, they are opposed to such in hostility, or, as in comedy, they are displayed within these characters themselves, without further mediation, in a condition of resolution.

(*b*) *Dramatic Composition*

In discussing the drama as a concrete work of art, I propose to emphasize, briefly, the following fundamental points:

First there is the unity of the same viewed in contrast to that of the Epos and the lyric poem.

Secondly, we have to consider the articulation of its parts, of its separate parts and their development.

Thirdly, there is the external aspect of diction, dialogue, and verse-measure.

(*α*) What we have in the first instance to observe and, from the broadest point of view, to establish with regard to the unity of the drama, is connected with a remark made in a previous passage to the effect that dramatic poetry, in contradistinction to the Epos, must be more strenuously self-concentrated. For, although the Epic makes a specific event its centre of unity, this is none the less expanded over a wide and manifold field of the national existence, and may break up into very various episodes and the independent presentation which belongs to each as parts of the entire panorama. An analogous appearance of merely general connection, on grounds which are converse to the above, is permissible to certain types of lyrical poetry. Inasmuch, however, as in dramatic poetry, from one point of view, that epic foundation, as we have seen, falls away — and as, otherwise regarded, the individual characters do not find their expression under the insulation proper to lyric expression, but rather assert in such a way their

mutual relations to one another, by means of the opposed features of their characterization and aims, that it is just this personal relation which constitutes the ground of their dramatic realization — it follows, as by a law of necessity, that the synthetic unity of the entire composition is of a more stringent character. Now this more restricted homogeneity is quite as much objective as it is ideal in its nature. It is objective relatively to the features of the practical content of the objects, which the different characters carry out in a condition of conflict. It is ideal or subjective in virtue of the fact that this essentially substantive content appears in dramatic work as the passion of particular characters, so that the ill-success or achievement, fortune or misfortune, victory or defeat, essentially affect the individuals, whom such concern, in their actual intention.[5]

The more obvious laws of dramatic composition may be summarized in the time-honoured prescription of the so-called unities of place, time, and action.

(*αα*) The inalterability of one exclusive *locale* of the action proposed belongs to the type of those rigid rules, which the French in particular have deduced from classic tragedy and the critique of Aristotle thereupon. As a matter of fact, Aristotle merely says[6] that the duration of the tragic action should not exceed at the most the length of a day. He does not mention the unity of place at all; moreover, the ancient tragedians have not followed such a principle in the strict sense adopted by the French. As examples of such a deviation, we have a change of scene both in the Eumenides of Æschylus and the Ajax of Sophocles. To a still less extent can our more modern dramatic writing, in its effort to portray a more extensive field of collision, *dramatis personae* of whatever kind and incidental event, and, in a word, an action the ideal explication of which requires, too, an external environment of greater breadth, subject itself to the yoke of a rigid identity of scene. Modern poetry, in so far, that is, as its creations are in harmony

with the romantic type, which as a rule displays more variety and caprice in its attitude to external condition, has consequently freed itself from any such demand. If, however, the action is in truth concentrated in a few great motives, so that it can avoid complexity of external exposition, there will be no necessity for considerable alternation of scene. Indeed, the reverse will be a real advantage. In other words, however false such a rule may be in its purely conventional application, it contains at least the just conception that the constant transition of scene, without any particular reason why we should have one more than another, is obviously quite inadmissible. The dramatic concentration of the action ought necessarily to assert itself also in this external aspect, and thus present a contrast to the Epos, which is permitted in the most varied way to adapt itself to the fresh expatiation in the form of the spatial condition and its changes. Moreover, from a further point of view, the drama is not, as the Epos, composed exclusively for the imaginative sense, but for the direct vision of our senses. In the sphere of the pure imagination we can readily pass from one scene to another. In a theatrical representation, however, we must not put too great a strain on the imaginative faculty beyond the point which contradicts the ordinary vision of life. Shakespeare, for example, in whose tragedies and comedies there is a very frequent change of scene, had posts put up with notices attached to them indicating the particular scene on view. A device of this kind is a poor sort of affair, and can only impair the dramatic effect. For this reason the unity of place is at least commendable to the extent that its intelligibility and convenience are *primâ facie* assured, in so far, that is, that all confusion is thus avoided. But after all, no doubt, much may still be trusted to the imagination, which would conflict with our ordinary perception and notion of probability. The most convenient course in this, as in other matters, is a happy mean; in other words, while not wholly excluding the claim of purely

natural fact and perception, we may still permit ourselves considerable license in our attitude to both.

(*ββ*) The unity of *time* is a precisely similar case. In the pure realm of imaginative idea we may no doubt, with no difficulty, combine vast periods of time; in the direct vision of perception we cannot so readily pass over a few years. If the action is, therefore, of a simple character, viewed in its entire content and conflict, we shall do best to concentrate the time of such a conflict, from its origin to its resolution, in a restricted period. If, on the contrary, it demands character richly diversified, whose development necessitates many situations which, in the matter of time, lie widely apart from one another, then the formal unity of a purely relative and entirely conventional duration of time will be essentially impossible. To attempt to remove such a representation from the domain of dramatic poetry, on the *primâ facie* ground that it is inconsistent with the strict rule of time-unity would simply amount to making the prose of ordinary facts the final court of appeal, as against the truth of poetic creation. Least of all need we waste time in discussing the purely empirical probability that as audience we could, in the course of a few hours, witness also, directly through our sense, merely the passage of a short space of time. For it is precisely in the case where the poet is most at pains to illustrate this conclusion that, from other points of view, he wellnigh invariably perpetrates the most glaring improbabilities.

(*γγ*) In contrast to the above examples of unity, that of *action* is the one truly inviolable rule. The true nature, however, of this unity may be a matter of considerable dispute. I will therefore develop my own views of its significance at greater length.

Every action must without exception have a *distinct* object which it seeks to achieve. It is through his action that man enters actively into the concrete actual world, in which also the most universal subject-matter is in its turn

accepted in the poetic work and defined under more specific manifestation. From this point of view, therefore, the unity will have to be sought for in the realization of an end itself essentially definite, and carried under the particular conditions and relations of concrete life to its consummation. The circumstances adapted to dramatic action are, however, as we have seen, of a kind that the individual end meets with obstructions at the hands of other personal agents, and this for the reason that a contradictory end stands in its path, which in its turn equally strives after fulfilment, so that it is invariably attached to the reciprocal relation of conflicts and their devolution. Dramatic action in consequence rests essentially upon an action that is involved with *resistance*;[7] and the genuine unity can only find its *rationale* in the entire movement which consists in the assertion of this collision relatively to the definition of the particular circumstances, characters, and ends proposed, not merely under a mode consonant to such ends and characters, but in such a way as to resolve the opposition implied. Such a resolution has, precisely as the action itself has, an external and an inside point of view. In other words, on the one side, the conflict of the opposed *ends* is finally composed; and on the other the particular *characters*, to a greater or less extent, have committed their entire volitional energy and being to the undertaking they strive to accomplish. Consequently the success or misadventure of the same, to complete or partial execution, the inevitable disaster or the secure union effected with intentions that are apparently opposed to their extent, also determine the destiny of the character in question, that it is inextricably involved with that which it was impelled to commit to such activity. A true end is therefore only then consummated, where the object and interest of the action, around which all revolves, are identified with the individuals concerned, and absolutely united to them. And whether the difference and opposition of the dramatic character assumes a simple form or branches out in various accessory

episodes and individuals, the unity in either case may be of a more severe or less stringent nature. Comedy, for instance, in the many-sided features of its worked-out intrigue does not require such deliberate self-concentration as tragedy does, which is as a rule motived on grandiose and simple lines. Romantic tragedy, however, is also in this respect more varied and less consistent in its unity than is classic tragedy. And even where there is more licence the relation of the episodes and supplementary characters must be throughout recognizable; and the entirety of the piece should also naturally and without strain fit in with and help to complete the conclusion. So, for example, in "Romeo and Juliet," the discord between the families, which lies outside the lovers and their object and destiny, is no doubt the base on which the action is shaped, though not the actual matter on which all actually depends. Shakespeare consequently devotes the necessary, if also wholly subordinate attention to the final issue of this conflict in his conclusion. In the same way in "Hamlet" the fortunes of Denmark remain a subsidiary interest, though with the entrance of Fortinbras they are apparently considered, and are settled at last satisfactorily.

No doubt in the particular end, which resolves the colliding factors, the possibility of fresh interests and conflicts may be presented; it is, however, the *one* collision with which the action is concerned, which has to discover its final adjustment in the essentially independent composition. Of this type are the three tragedies of Sophocles borrowed from the Theban cycle of myths. The first contains the discovery by Œdipus of the murderer of Laius; the second his peaceful death in the home of the Eumenides; the third the fate of Antigone. And, despite of this connection, every one of the three is equally an intrinsically complete whole independent of the other two.

(*β*) With regard to our *second* point, namely, that of the mode of denouement in a dramatic composition, we have three main features of distinction to consider between it and epic composition or the song, namely,

the size of its extension, the nature of its progression and its division into scenes and acts.

(*αα*) We have already seen that the embrace of a drama — is not so extensive as the demand of the epos implies. I propose, therefore — over and above the two features already discussed of that world-condition, which is necessarily implied in the complete picture of the epic, and the more simple collision which is an equally essential constituent of the content of drama — merely to advert to the further ground, that in the drama the greater part of everything that the muse of the epic poet has to describe and linger over as servant of our imaginative vision, is omitted altogether from the scenic reproduction. And, further, in the case of drama it is not actual exploit, but the exposition of personal passions which is here the main thing. This personal life, however, in contrast to the expanse of the phenomenal world, is concentrated in simple emotions, sentences, decisions, and the like; and here, too, as distinct from the collateral display of epic narration and its historical part, it gives effect to the principle of lyric absorption and the origination and expression in present time of passion and idea. Dramatic poetry is, however, not satisfied with merely *one* situation;[8] it presents the ideal world of emotional life or intelligence in active self-assertion as a totality of circumstances and ends of very various character, which expresses taken together, all that, if viewed relatively to its activity, passes in such an inward world. In comparison with the lyrical poem, the drama reaches out to and is completed in a far more extensive embrace of subject-matter. To summarize this comparative relation we may say, perhaps, that dramatic poetry stands as a mean between the wide embrace of the Epopaea and the concentrated compression of the Lyric.

(*ββ*) Yet more important than this aspect of external extension is the nature of the *dramatic progression* as opposed to the mode of the epic's devolution The form of the epic objectivity demands throughout, as we

have seen, a lingering style of description, which may along with this become more intense and pointed in its display of active obstruction. It is possible that we may at first blush incline to the view that, inasmuch as other ends and characters resist the main end and principal character in dramatic exposition, dramatic poetry is entitled to accept this sort of pause and obstacle as an essential feature of its principle. As a matter of fact just the reverse is the case. The true dramatic progression is a *continuous* movement *onwards* to the final catastrophe. This is clear from the simple fact that it is in *collision* that we find the emphatic turning point. In consequence of this we have the twofold view of, in the first place, a general strain towards the outbreak of this conflict, and, secondly, the necessity implied in this discord and contradiction of views, ends, and activities, that they should find some resolution to which they are driven forwards. By this we by no means assert that mere celerity of forward movement is simply in itself beautiful in the dramatic sense. On the contrary, the dramatic poet should have himself room to supply every situation on its own account with all the motives which it truly implies. Episodical scenes, however, which only impede the action are contrary to the nature of the drama.

(*γγ*) As a final point, we may divide the course of the dramatic work most naturally by simply following the stages implied in the notion of dramatic movement itself. In this connection Aristotle[9] long ago remarks that a whole is that which possesses a beginning, a middle, and a conclusion. He further defines a beginning ‘as that which, of itself necessary, does not issue from something else, and out of which something other than itself issues and proceeds. The end is the reverse of this, namely, that which originates from something else, either of necessity, or mainly so at least, but which does not itself lead to further consequence. The middle is

that which both issues from something else, and also is that from which something else proceeds.

Now no doubt in the reality of our experience every action includes many presuppositions which make it a difficult matter to decide the exact point where we may find the true commencement. In so far, however, as dramatic action rests essentially on a definite state of collision, the right point of departure will lie in the situation, out of which the future devolution of that conflict, despite the fact that it has not as yet broken out, will none the less in its further course issue. The end, on the contrary, will then be attained, when the resolution of the discord and its development is secured in every possible respect. In the midway condition between origination and end we have the conflict of ends, and the struggle of individual persons in collision. These different section's are in dramatic composition, so to speak, the phases or moments of the action of what are also actions, and the definition of this is admirably indicated by the *acts* of the piece. They are now of course more or less equivalent to pauses of time, and a prince on one occasion, who was either in a hurry, or wished the action to proceed without interruption, blamed his chamberlain openly that such a pause occurred. With regard to their *number three* such acts for every kind of drama is the number that will adapt itself most readily to intelligible theory. Of these the *first* discloses the appearance of the collision, which is thereupon emphasized in the *second* with all the animation of conflicting interests as the positive difference of such discord and its progression, until, *finally*, driven as it were upon the very apex of its contradiction, it is necessarily resolved. We may cite — as some kind of illustration of this division which the nature of such an action suggests — from ancient drama, in which no doubt the dramatic articulation is as a rule less distinct, the trilogies of Æschylus, in which each single play combines with the others to form a single and completely exclusive whole.[10] In modern poetry the

Spaniards mainly follow such a division into three acts. The English, French, and Germans, on the contrary, for the most part divide the entire play into *five* acts, in which the initial exposition is assigned to the first, the three next are occupied with the various aggressions and reactionary effects, the complex intentions and conflicts of the opposed parties; and it is not until the fifth that we reach the entire resolution of such contending forces.

(*γ*) The third and final important aspect we have to investigate in our present connection is the nature of the *external means*, in so far as the employment of the same by dramatic art can be held distinct from and independent of the actual scenic representation that is otherwise essential to its complete display. An account of the specific nature of diction which is frequently dramatic generally, secondly, of the distinguishing features of the monologue, dialogue, and the like, and, lastly, of verse measure, will be all that is necessary here. As we have more than once insisted in the drama the fact of the action is not the external aspect to which we refer, but the exposition of the ideal spirit of the action, not merely in respect to the *dramatis personae* and their passion, pathos, resolve, interaction, and mediation, but also relatively to the universal essence of the action in its conflict and destiny. It is this ideally pregnant spirit, in so far as poetry gives embodiment to it in poetic form, which pre-eminently discovers an appropriate expression in the language of poetry, viewing this, as we should, as the most spiritual way of expressing emotions and ideas.

(*αα*) But, moreover, just as the drama combines the principles of the Epos and the Lyric, dramatic diction, too, is compelled both to carry and assert within itself elements that are lyrical and those that are epic. The *lyrical* approach is rather a special feature of modern drama, and as a rule in those cases where the personal life is or tends to be self-absorbed, and seeks in its decision and action throughout to retain the self-consciousness of its inward resources. But none the less this unveiling of the individual heart-

life, if it is to remain dramatic, ought not merely to be the exploitation of a vague and variable cloud of emotions, memories, and visions; it should keep its relation to the action constant throughout, should make its result identical with that of the different phases of the same.

In contrast to this subjective pathos the epic character of the diction, which we may define as the *objective* pathos, is mainly concerned with the unfolding of what is substantive in dramatic relations, ends, and persons on lines rather directed to the vision of the audience. Such a point of view can also in part assume a lyrical tone, remaining when it does so dramatic only in so far as it does not more entirely in its independent force form the progress of the action and its asserted relation to the same. And over and above this, as a second residue, so to speak, of epic poetry, we may have the records of narrative, descriptions of battles and the like thrown in. But these also, in genuine dramatic composition, ought to be marked with greater compression and animated movement, and, relatively to their presentment as narrative, a necessary connection with the progress of the action should be evident.

In conclusion, genuine dramatic art consists in the expression of individuals in the conflict of their interests and the discord roused between their characters and their transitory passions. It is here that the twofold aspect of lyric and epic poetry[11] will assert its power in true dramatic union: and we have then attached to this the aspect of positive external fact expressed likewise in the medium of language, as where we have, for instance, the departure and entrance of *dramatis personae* as a rule announced beforehand; not unfrequently also their external habit or demeanour is indicated by other persons.

A fundamental distinction over the entire field now under review is the so-called realistic mode of expression, as opposed to a conventional speech

of the theatre and its rhetoric. Diderot, Lessing, Goethe, and Schiller also in their youth addressed themselves in modern times above all to this attitude of direct and natural expression. Lessing did so with the powers of a trained and sensitive observation Schiller and Goethe did so with their predilection for the direct animation of unembellished robustness and force. That men should converse with one another as in the Greek, or with more insistance — and in this latter respect the criticism has a reasonable basis — as in French comedy and tragedy was scouted as contrary to Nature. This type of naturalism, however, may very readily, with its superfluity of merely realistic traits, fall into the other extreme of dryness and prose, in so far, that is, as the characters are not developed in the essential qualities of their emotional life and action, but only as they happen to express themselves in the literal accuracy of their individual life, without indicating therein any more significant self-consciousness or any further sense of their essential position. The more natural the characterization is allowed to remain in this sense the more prosaic it becomes. In actual life men converse and strive with one another before everything else on the mere basis of their *distinct singularity.* If our object is to depict them simply as such it is impossible that they should also be represented in their truly substantive significance.[12] And, if we look at the essence of the matter, this question of crudeness and urbanity can only be in the last instance treated subject to the above considerations. In other words while, on the one hand, such crudeness or coarseness is made to issue from the particular personality, which is exclusively committed to the unmediated dictation of an imaginative type of outlook and feeling, in the converse treatment an urbanity is the outcome of a purely abstract and formal generalization of consideration for others, recognition of the claims of personality, love, honour, and the like, in which nothing that is suggestive of a rich and objective content can be expressed.[13] Between these two extremes of a purely formal generality and this natural

expression of unpolished peculiarities we have the true universal, which is throughout neither formal nor destitute of individuality, but finds its concrete realization in a twofold way from the defined content of character and the objective presence of opinions and aims. Genuine poetry will therefore consist in the assertion of what belongs to immediate and actual life as characteristic and individual in the purifying medium of universality,[14] both aspects being permitted to mediate each other. In this case we are conscious, even in respect to diction, that without being wholly banished from the basis of reality and its actual traits of truth, we are nevertheless carried into another sphere, that is to say the ideal realm of art. Of this latter character is the diction of Greek dramatic poetry, the later diction of Goethe, and in part, too, that of Schiller, and in his own way Shakespeare's also, although the Englishman, owing to the peculiar conditions of the contemporary stage, is forced in part now and again to accommodate his verbal language to the actual ability of the actor.[15]

(*ββ*) We may *further* classify the mode of dramatic expression as that of choral interlude, monologue, and dialogue. It is the ancient drama which has pre-eminently elaborated the distinction between chorus and dialogue. In our modern drama this falls away. What, in the classical composition, was presented by the *chorus*, is now rather placed in the mouths of the leading characters. The choric song expresses, among the ancients, by way of contrast to the particular characters and their more personal or more reciprocal conflict, the general or more impersonal view of the situation, and the emotions it excites, in a manner which at one time inclines to the objective style of epic narrative, at another to the impulsive movement of the Lyric. In the *monologue*, on the other hand, it is the isolated individual who, in a given situation of the action, becomes objective on his own account. Monologues are, therefore, dramatically in their right place at

those moments chiefly when the emotional life is entirely self-concentrated as the result of previous events; when it sums up, as it were, the nature of the cleft between itself and others, or its own spiritual division; or when it arrives at some sudden decision, or comes to the final point of resolve on matters already long debated.

The *third* and complete form of the drama, however, is the *dialogue*. For in this the *dramatis personae* are mutually able to express their character and aims, not merely relatively to their personal attitude to each other, but also to the substantive character of the pathos disclosed; they engage in conflict, and thereby actually advance the movement of the action. We may further distinguish in the dialogue between the expression of a pathos that is *subjective* and one that is *objective.* The first rather appertains to a given passion of more accidental a nature, whether it be the case in which it is retained essentially in suppression, and is only expressed aphoristically, or that in which it finds a vent in the most complete and exhaustive explosion. Poets, who endeavour to arouse the full movement of personal emotion by means of poignant scenes, are exceptionally partial to this type of pathos. Nevertheless, despite all their endeavour to depict personal suffering and unrestrained passion, or the unreconciled inward dissension of soul-life, it remains the fact that the human soul, in its depth, is less effected thereby than it is through a pathos, wherein at the same time a genuine objective content is evolved. For this reason the earlier plays of Goethe, despite all the real penetration of their subject-matter and the natural force of their dialogue, make on the whole a weaker impression. And, in the same way, outbreaks of unrelieved distraction and unrestrained fury, effect a truly healthy sense only in subordinate degree; and, above all, what is wholly frightful rather chills us than makes the blood flow. The poet may describe passion with all the overwhelming power possible. It is ineffective; the heart is merely rent in pieces,[16] and turns aside from it. What we fail to find

here is that which art can least dispense with, the positive aspect of reconciliation. The ancient tragedians, therefore, mainly sought for their effect by means of the objective type of pathos; nor is there wanting here genuine human individuality, so far as this was compatible with their art. The plays, also, of Schiller possess this pathos of a great spiritual force,[17] a pathos which is penetrative throughout, and is manifested and expressed everywhere as fundamental to the action. It is, above all, to this circumstance that we may ascribe the lasting effect which the tragedies of Schiller produce even in our own day; I refer in particular to their scenic reproduction. For that which produces a profound dramatic effect of universal and enduring appeal can be only the substantive in action — by which I mean, viewing it as definite content, the ethical substance therein, or, in its more formal aspect, the grandeur of ideal reach and character, in which respect, again, Shakespeare is supreme.

(*γγ*) I will, in conclusion, add merely a word or two on the point of *verse-measure.* Dramatic metre is best when it lies midway between the tranquil, uniform flow of the hexameter and the more interrupted and split-up syllabic metres congenial to the Lyric. In this respect the iambic metre is above all others commendable. For the iambus, with the rhythm of its onward movement, which may be either accelerated by anapaests, or be made more solemn and weighty with the spondee, forms a most fitting accompaniment to the march of the action; and in quite a peculiar way the senarius possesses a real tone of noble and restrained emotional force. Among modern authors the Spaniards, with an artistic purpose the reverse of this, adopt trochaeic tetrameters, the effect of which is one of tranquil retardation; a measure which, with its variety of interwoven rhymes and assonances, in part, too, with its alternative absence of rhyme, is admirably adapted to the imaginative exuberance of phantasy, and to the fine-drawn argumentative antitheses, which characterize this poetry and impede rather

than advance the action. In a contrast of a similar kind, the French Alexandrine is harmonious with the formal carriage and the declamatory rhetoric of passions, sometimes held in restraint and at others expressed at full heat, the conventional expression of which the art of French drama has tasked itself to elaborate. The more realistic Englishman, whom we Germans too have followed in more recent times, has, on the contrary, retained the iambic metre, which Aristotle long ago defined as τὸ μάλιστα λεκτικὸν τῶν μἐτρων[18] He has, however, not accepted the same in identical form with the Greek trimeter, but substituted a measure of less pathetic character, if capable of the greatest freedom of treatment.

(*c*) *The Relation of the Dramatic Composition to the General Public.*

Although the advantages or defects of diction and metre are important, also, in epic and lyrical poetry, we must nevertheless ascribe a more emphatic effect to them in dramatic compositions, in virtue of the circumstance that we are in this case dealing with opinions, characters, and actions which have to appear before us in all the reality of life itself. A comedy of Calderon, for example, with all the interplay of fantastic wit we may assume, embodied, however, in the kind of diction we associate with this poet, with its logical niceties and its bombast — subject, also, to all the variations of his lyrical metres — would not, we may presume, on the simple ground of this manner of expression, be likely to arouse any general sympathy. It is on account of this visual presence and nearness of approach that the other aspects of the content, apart from that of purely dramatic form, are brought into a far more direct relation to the public before whom they are reproduced. We should like shortly to explain the nature of this.

Scientific compositions and lyrical or epic poems either possess a distinct public, whose interest in such works is associated with their profession, or it is a matter of chance into what hands compositions of this character may fall. If a book does not please anyone it can be neglected, just

as a man passes by the picture or statue that he does not like; such works may, in fact, be held to carry to some extent with them the author's admission that his book is not written for such. The case is somewhat otherwise with dramatic works. Here we have a distinct public for which the author has to cater, and he is under certain obligations towards it. Such a public possesses the right of applause no less than expressed displeasure; inasmuch as a work is represented before it in its entirety, and the appeal is made that it should be enjoyed, with sympathy in a given place and at a stated time. A public of this sort, as in the case of any — other public jury, is of a very varied character; it differs in its education, interests, accustomed tastes, and hobbies, so that to secure complete success in certain distinct respects a talent in the display of vulgar effect, or at least a relative shame-facedness in regard to the finest demand of genuine art, may be necessary. No doubt the dramatic poet has always the alternative left him to despise his public. But in that case he obviously fails to secure the very object for which dramatic writing exists. With us Germans, to an exceptional extent, it has become the fashion since the times of Tieck thus to scorn the public. Our German play-writer will express his own particular individuality, but takes no trouble to commend the result to his audience. The ideal of our German egotism is quite the reverse, namely, that every man must turn out something different to that of other people, in order that he may prove his originality. It was owing, in part, to this that Tieck and the brothers Schlegel, men who, from the very nature of their sentimental irony, were quite unable to master the emotional forces and intelligence of their nation and time, fell foul of Schiller, and tried to blacken his poetical reputation on the ground that he did among us Germans manage to strike the right key, and obtain a popularity unsurpassed. With our neighbours, the French, we find the opposite. Their authors write with the present effect on the public always in view, which further, on its own account, is capable of being a

keener and less indulgent critic of the author, owing to the fact that a more definite artistic taste is already fixed in France: with us anarchy prevails, and everyone expresses his critical views, applauds or condemns just as he likes, or as his opinions, emotion, and mood may chance to dictate.

Inasmuch, however, as it is an essential part of the definition of the dramatic composition that it should possess the vitality able to command a favourable popular reception, the dramatic poet should submit to the conditions — quite apart, that is, from the accidental circumstances or tendencies of the time — which are likely to secure this result in an artistic form. What these are I will attempt to explain, at least in their more general features.

(*a*) Now, in the *first* place, the ends, which in a dramatic work come into conflict and are resolved out of such conflict, either possess a general human interest, or at least have at bottom a pathos, which is of a valid and substantive character for the people for whom the poet creates his work. In such a case, however, the universal human quality and what is more definitely national, in so far as either are connected with the substance of dramatic collisions, may lie very widely apart. Compositions, which stand in the national life, at the very summit of their dramatic art and development, may consequently quite fail to be appreciated by another age and nation. We find, for example, in Hindoo lyrical poetry, even in our own time, much that carries with it a real charm, tenderness, and fascinating sweetness. The particular collision, however, around which the action in the "Sakontala" revolves, in other words, the furious curse upon Sakontala of the Brahman, because she does not see him, and omits to make her obeisance, can only strike us as absurd, so much so in fact that, despite all other excellences in this quite exceptionally beautiful poem, we fail to discover any interest in the very culminating crisis of the action. We may affirm very much the same thing of the way in which the Spaniards treat the

motive of personal honour with the abstract severity of a logic, the brutality of which outrages most deeply all our ideas and feelings. Let me recall, for example, the attempt made by our own theatrical management to bring upon the stage one of the less famous plays of Calderon entitled "Clandestine Revenge for Clandestine Insult," an attempt condemned to failure from the first on this ground. Another tragedy, which on similar lines portrays a more profound human conflict, "The Physician of his own Honour," under the changed title of "The Intrepid Prince," has after some revision secured more leeway; but this, too, is handicapped by its abstract and unyielding Catholic principle. Conversely, and in an opposite direction, the Shakespearian tragedies and comedies are appreciated by a public that is constantly increasing. We find here that, despite all their nationality, the universal human interest is incomparably greater. Shakespeare has only failed to secure an entrance where the national conventions of art are so narrow and specific that they either wholly exclude or materially weaken works of the Shakespearian type. A similar position of advantage, such as that we allow to Shakespeare, would be attributable to the tragedies of the ancients, if we did not, apart from our changed habits in respect to scenic reproduction and certain aspects of the national consciousness, make the further demand of a profounder psychological penetration and a greater breadth of particular characterization. So far, however, as the *subject-matter* of ancient tragedy is concerned, it could never at any time fail in its effect. We may, therefore, broadly affirm that, in proportion as a dramatic work accepts for its content wholly specific rather than typical characters and passions, conditioned, that is, exclusively by definite tendencies of a particular epoch of history, instead of mainly concerning itself with human interests substantive in all times, to that extent, despite of all its other advantages, it will be more transitory.

(*β*) And, *further*, it is necessary that universal human ends and actions of this kind should emphasize their poetic individualization to the point of animated life itself. Dramatic composition does not merely address itself to our sense of vitality, a sense which even the public certainly ought to possess, but it must itself, in all essentials, offer a living actual presence of situations, conditions, characters, and actions.

(*αα*) I have already, in a previous passage of this work,[19] entered into some detail relatively to the aspect of local environment, customs, usages and other matters which affect the visual representation of action. In this respect dramatic individualization ought to be either so thoroughly poetical, vital, and rich with interest that we can discount what is alien to our sense, and feel ourselves attracted to the performance by this vital claim on our attention, or it should not pretend to do more than present such characteristics as external form, which is entirely outshone by the spiritual and ideal characteristics which underlie it.

(*ββ*) More important than this external aspect is the vitality of the *dramatis personae.* Such ought not to be merely specific interests personified, which is only too frequently the case at the hands of modern dramatists. Such abstract impersonations of particular passions and aims are wholly destitute of dramatic effect. A purely superficial individualization is equally insufficient. Content and form in such cases, as in the analogous type of allegorical figures, fail to coalesce. Profound emotions and reflections, imposing ideas and language offer no real compensation. Dramatic personality ought to be, on the contrary, vital and self-identical throughout, a complete whole in short, the opinions and characterization of which are consonant with its aims and action. It is not the breadth of particular traits which is here of first importance, but the permeating individuality, which synthetically binds all in the central unity, which it in truth is, and displays a given personality in speech and action as issuing

from one and the same living source, from which every characteristic, whether it be of idea, deed or manner of behaviour, comes into being. That which is merely an aggregate of different qualities and activities, even though such be strung together in one string, will not give us the vital character we require. This presupposes from the point of view of the poet himself a creative activity which is instinct with life and imagination. It is to the latter type, for instance, that the characters of the Sophoclean tragedies belong, despite the fact that they do not possess the variety of particular characteristics which distinguish the epic heroes of Homer. Among later writers Shakespeare and Goethe are pre-eminently famous for the vitality of their characterization. The French, on the contrary, particularly in their earlier dramatic compositions, appear to have been rather content to excogitate characters that are little more than the formal impersonations of general types and passions, than to have aimed at giving us true and living persons.

(*γγ*) But, *thirdly*, the task of dramatic creation is not completed with the presentment of vital characterization. Goethe's Iphigeneia and Tasso throughout are good enough examples of this poetic excellence — and yet they are not, if we look at them more strictly, by any means perfect examples of dramatic vitality and movement. It is for this reason that Schiller long ago remarked of the Iphigeneia, that in it is the ethical content, the heart experience, the personal opinion which is made the object of the action, and is as such visually reproduced. And unquestionably the display and expression of the personal experience of different characters in definite situations is not by itself sufficient; we must also have real emphasis laid on the collision of the *ultimate ends* involved, and the forward and conflicting movement which such imply. Schiller is consequently of the view that the movement of the Iphigeneia is not sufficiently disturbed; we are permitted to linger within it too long and easily. He even maintains that it without

question inclines to the sphere of epic composition, if we contrast it at least with any strict conception of tragedy. In other words, dramatic effect is action simply as action; it is not the exposition of personality alone, or practically independent of the express purpose and its final achievement. In the Epos play may be permitted to the breadth and variety of character, external conditions, occurrences and events; in the drama, on the contrary, the self-concentration of its principle is most asserted relatively to the particular collision and its conflict. It is thus that we recognize the truth of Aristotle's dictum,[20] that tragic action possesses two sources (αἴτια δὺο), opinion and character (διάνοια καὶ ἦδος), but what is most important is the end (τέλος), and individuals do not act in order to display diverse characters, but these latter are united with a common bond of imaginative conception to the former in the interest of the action.

(*γ*) As a matter for our *final* consideration in this place there is the relation in which the *poet* is placed to the general public. Epic poetry in its truly primitive state requires that the poet place wholly on one side his distinctive personality in its contrast to his actually objective work. He offers us the content of that and only that. The lyric poet, on the contrary, deliberately expresses his own emotional life and his personal views of the world.

(*αα*) We might imagine that the poet must perforce withdraw himself in the drama by reason of the very fact that he brings action before us in its sensuous presence, and makes the characters speak and active in their own names, to a greater extent than in the Epos, in which he appears at any rate as narrator of the events. Such an impression is only, however, very partially valid. For, as I have already contended, the drama is exclusively referable in its origin to those epochs, in which the personal self-consciousness, both relatively to the general outlook on life and artistic culture, has already reached a high degree of development. A dramatic

composition therefore should not, as an epic one does, present the appearance as though it originated from the popular consciousness simply, for the display of which content the poet is merely an instrument of expression which possesses no reference to the poet's personal life; rather what we seek to recognize in the complete work is quite as much the product of the self-aware and original creative force, and by reason of this the art and virtuosity of a genuine poetic personality. It is only thereby that dramatic productions attain to the genuine excellence of their artistic vitality and definition, as contrasted with the actions and events of natural life. It is on this account that where the authorship of dramatic works is a subject of controversy we find such to be nowhere more frequent than where it concerns the primitive Epopaea.

(*ββ*) From the opposite point of view the general public too, if it has itself preserved a true sense of meaning of art, will not submit to have placed before it in a drama the more accidental moods and opinions, the peculiar tendencies and the one-sided outlook of this or that individual, the expression of which is more appropriate to the lyric poet. It has a right to demand that in the course and final issue of the dramatic action, whether of tragedy or comedy, what is fundamentally reasonable and true should be vindicated. Being myself convinced of this I have in a previous passage given a place of first importance to the demand that the dramatic poet must in the profoundest sense make himself master of the essential significance of human action and the divine order of the world, and along with this of a power to unfold this eternal and essential foundation of all human characters, passions and destinies in its clarity as also in its vital truth. It is no doubt quite possible that a poet, in rising equal to this demand upon his powers of penetration and artistic achievement, may under particular circumstances find himself in conflict with the restricted and uncultured ideas of his age and nation. In such a case the responsibility for such a

disunion does not rest with himself, but is a burden the public ought to carry. He has the single obligation to follow the lead of truth and his own compelling genius, the ultimate victory of which, provided it is of the right quality, is no less assured than that of ultimate truth itself universally. It is impossible to define closely the limits within which a dramatic poet is entitled to bring his actual personality before the public. I will therefore merely recall attention to the fact in a general way that in many periods of history dramatic poetry, no less than other kinds, is induced to disseminate with a vital impulse novel ideas upon politics, morals, poetry, religion, and the like. So early as Aristophanes we have polemics in those comedies of his youth against the domestic condition of Athens and the Peloponnesian war. Voltaire again frequently endeavours in his dramatic works to popularize his free thought principles. But above all worthy of notice is the effort of our Lessing in his "Nathan" to vindicate his ethical faith against the strait waistcoat of a blockish orthodoxy. In still more recent times too Goethe has in his earliest works challenged the prose of our German life and its defective views of art. Tieck has to some extent followed his lead in this respect. Where personal views of the above type are not only of superior worth, but are further not expressed in such deliberate separation from the action of the drama as to make the latter appear as a mere means for their exploitation, the claims of true art are not likely to suffer injury. If, however, the freedom of the composition is thereby impaired, though no doubt the poet may possibly produce no inconsiderable impression on the public by his introduction of his own predilections into his work; yet, however true they may be, if they are at the same time unable to coalesce with the work as an artistic whole the interest thereby aroused can only be limited to the matters thus handled; it is in fact no true artistic interest at all. The worst case of all is that, however, where a poet with similar deliberation seeks, out of pure flattery and in order to please, to give

prominence to some popular prejudice which is entirely false. His sins of commission are in that case twofold, not merely against art, but truth no less.

(*ββ*) One further remark may be perhaps admitted in this connection to the effect that among the particular types of dramatic art a more limited measure of indulgence is permitted to tragedy than to comedy in this more free expatiation of the personality of the poet. In the latter type the contingency and caprice of individual self-expression is from the first agreeable to its main principle. Thus we find that Aristophanes frequently makes matters of immediate interest to his Athenian public the subject of his parabases. In portions of these he gives free utterance to his own views upon contemporary events and circumstances, and withal shrewd advice to his fellow citizens. He is at other times concerned to defend himself from the attacks of political opponents and his artistic rivals. Indeed there are passages in which he deliberately eulogizes himself and his peculiarities.

2. THE EXTERNAL TECHNIQUE OF A DRAMATIC COMPOSITION

Poetry, alone among the arts, completely dispenses with the sensuous medium of the objective world of phenomena. Inasmuch moreover as the drama does not interpret to the imaginative vision the exploits of the past, or express an ideal personal experience to mind and soul, but rather is concerned to depict an action in all the reality of its actual presence, it would fall into contradiction with itself if it were forced to remain limited to the means, which poetry, simply as such, is in a position to offer. The present action no doubt belongs entirely to the personal self, and from this point of view complete expression is possible through the medium of language. From an opposite one, however, the movement of action is towards objective reality, and it requires the complete man to express its

movement in his corporeal existence, deed and demeanour, as well as the physiognomical expression of emotions and passions, and not only these on their own account, but in their effect on other men, and the reactions which are thereby brought into being. Moreover, in the display of individuality in its actual presence, we require further an external environment, a specific *locale*, in which such movement and action is achieved. Consequently dramatic poetry, by virtue of the fact that no one of these aspects can be permitted to remain in their immediate condition of contingency, but have all to be reclothed in an artistic form as phases of fine art itself, is compelled to avail itself of the assistance of pretty well all the other arts. The surrounding scene is to some extent, just as the temple is, an architectonic environment, and in part also external Nature, both aspects being conceived and executed in pictorial fashion. In this *locale* the sculpturesque figures are presented with the animation of life, and their volition and emotional states are artistically elaborated, not merely by means of expressive recitation, but also through a picturesque display of gesture and of posture and movement, which, in its objective form, is inspired by the inward soul-life. In this respect we may have brought home to us a distinction which recalls a feature I have at an earlier stage indicated in the sphere of music as the opposition implied in the arts of declamation and melody. In other words, just as in declamatory music language in its spiritual signification is the aspect of most importance, to the characteristic expression of which the musical aspect is entirely subordinate, whereas the movement of melody is unfolded freely on its own account in its own specific medium, although it too is able to assimilate the content of language — so also dramatic poetry, on the one hand, avails itself of those sister arts merely as instrumental to a material basis and environment, out of which the language of poetry is in its free domination asserted as the commanding central focus, upon and around which all else really revolves.

From the further point of view, however, that which in the first instance had merely the force of an assistant and accompaniment, becomes an object on its own account, and receives the appearance in its own domain of an essentially independent beauty. Declamation passes into song, action into the mimic of the dance, and scenery in its splendour and pictorial fascination itself puts forward a claim to artistic perfection.

In contrasting, then, a contrast frequently insisted upon, and more particularly in recent times, poetry in its simplicity with the external dramatic execution such as we have above described, we may continue the course of our review under the following heads of discussion.

Firsts there is the dramatic poetry, whose object is to restrict itself to the ordinary ground of poetry, and consequently does not contemplate the theatrical representation of its productions.

Secondly, we have the genuine art of the theatre, to the extent that is in which it is limited to recitation, play of pose and action, under the modes in which the language of the poet is able throughout to remain the definitive and decisive factor.

Lastly, there is that type of reproduction, which admits the employment of every means of scenery, music and dance, and suffers the same to assert an independent position as against the dramatic language.

(*a*) *The Reading and Recitation of Dramatical Compositions.*

The true sensuous medium or instrument of dramatic poetry is, as we have seen, not only the human voice and the spoken word, but the entire man, who not merely expresses emotions, ideas, and thoughts, but, as vitally absorbed in a concrete action, in virtue of all that he is influences the ideas, designs, the action and behaviour of others, experiences similar effects on himself, or maintains his independent opposition to them.

(α) In contrast to such a definite view, which is based upon the essential character of dramatic poetry itself, it is a feature of modern notions on the subject, particularly so among ourselves, to regard the organization of drama with a view to its theatrical reproduction as unessential and subsidiary, although as a fact all dramatic authors, even when they adopt this attitude of indifference and contempt, entertain the wish and hope to see their compositions on the stage. The result is that the greater number of more recent dramas are unable ever to find a stage, and the simple reason of this is that they are undramatical. We are not of course, therefore, in a position to deny that a dramatic composition may satisfy the conditions of genuine poetry in virtue of its intrinsic worth. What we affirm is that it is only to an action, the dramatic course of which is admirably adapted to theatrical representation, that we are to attribute such intrinsic dramatic worth. The best authority for such a statement is supplied by the Greek tragedies. It is true that we no longer see these on the contemporary stage, but they do nevertheless, if we regard the facts more closely, completely satisfy us to a real extent precisely on this ground that they were written without reserve for the theatre of their day. What has banished them from the theatre of today is not so much the character of their dramatic organization, which differs mainly from that of to-day in its employment of the chorus, as in the nature of national predilections and conditions, upon which for the most part, if we consider their content, they are based, and in which owing to the distance in which they are placed relatively to our own contemporary life we are unable now to feel ourselves at home. The malady of Philoctetes, for instance, the loathsome ulcer on his foot, his ejaculations and outcries, are as little likely to awaken the genuine interest of a modern audience as the arrows of Hercules, about which the main course of that drama revolves. In a similar way, though we may admit the barbaric cruelty of the human sacrifice in the Iphigeneia in Aulis and Tauris in an opera, we

find it absolutely necessary in tragedy at any rate that this aspect should be wholly revised as Goethe has in fact done.

(*β*) The difference, however, thus indicated between ancient and modern customs, which effects the mere perusal of such works, no less than the complete and vital reproduction of them as a whole, has had the further effect of pointing out to us another by-way, in which poets to some extent deliberately fashion their work exclusively for the reader's perusal, and in a manner by which the difficulty above indicated no longer affects the character of such compositions. There are no doubt in this connection isolated points of view, which merely refer to features of external form, which are implied in the so-called knowledge of the stage, and an indifference as to which does not lessen the poetical worth of a dramatical production. To these belong, for example, the careful regulation of the scenic arrangements, that one scene can follow without difficulty after another, though it requires great alterations in the scenery, or that the actor is given sufficient time to make the necessary change of costume, or to recover from his previous exertions. A knowledge and aptitude of this nature is neither indicative of any poetical superiority or the reverse; they rather depend upon the naturally varying and conventional arrangements of the theatre. There are, however, other features relatively to which the poet, in order to be truly dramatical, must have the animated reproduction visibly present in its substance, must make his *dramatis personae* speak and act conformably thereto, that is, in complete congruity with an actually present realization. Viewed in this light theatrical reproduction is a real test. For in the presence of the supreme court of appeal of a sound and artistic public the mere speeches and tirades of our so-called exquisite diction, if dramatic truth is not thereby asserted, will not hold water. There are periods, no doubt, in which the public also is corrupted by the culture it is the fashion so highly to praise, I mean by heads generally overstocked with the current opinions and fancies of the connoisseur and critic. Let it however only retain its own essentially sterling commonsense, and it will only be satisfied

in those cases where characters express themselves and act precisely as the reality of life no less than art demands and necessitates. If the poet, on the contrary, writes exclusively for the single reader he very readily gets no further than making his characters speak and behave much as they might do in an epistolary correspondence. If any one thus gives us the reasons for his aims and what he does, or unbares his heart in any other respect, instead of that which we should at once remark thereupon we get between the receipt of the letter and our immediate reply time for all kinds of reflection and idea. The imagination opens in this case a wide field of possibilities. In the *actually present* speech and rejoinder we have to presuppose that as between man and man the volition and heart, the movement of feeling and decision are more direct, that in short the dialogue passes on without any such recourse to considerable reflection, but at once from soul to soul, as eye to eye, mouth to mouth, and ear to ear. Only in such a case the actions and speeches are expressed with life from the actual personality, who has no time left him to make a careful selection from one out of many possibilities. Under this view of the case it is not unimportant for the poet throughout his composition to keep his eye on the stage, which renders such a direct type of animation necessary. Nay, for myself I go to the length of maintaining that no dramatic work ought to be printed, but rather, as no doubt with the ancients, it should belong to the stage repertory in manuscript form,[21] and only receive quite an insignificant circulation. We should at least in that case limit very considerably the present superabundance of dramas, which it is possible possess the speech of culture, fine sentiments, excellent reflections, and profound thoughts, but which are defective in the very direction which makes a drama dramatical, that is, in the display of action, and the vital movement which belongs to it.

(*γ*) In the mere *perusal* and *reading aloud* of dramatic compositions we find a difficulty in deciding whether they are of a type which would produce

the due effect from the stage. Even Goethe, whose experience of stage management in his later years was exceptional, was far from being dependable on this head, a result no doubt mainly due to the extraordinary confusion of our public taste, which is able to accept with approval almost anything and everything. If the character and object of the *dramatis personae* are on their own account great and substantive the manner of composition no doubt presents less difficulty. But as regards the motive force of interests, the various phases in the progress of the action, the suspended interest and development of situations, the just degree in which characters assert their effect on each other, the appropriate force and truth of their demeanour and speech — in all such respects the mere perusal unassisted by a theatrical performance can only in the rarest cases arrive at a reliable decision. Reading a work aloud is only under great qualification a further assistance. Speech in drama requires the presence of separate individuals. The delivery of *one voice*, however artistically it may adapt itself to different shades of tone in alternate or varying change is insufficient. Add to this the fact that in reading aloud we are throughout confronted with the difficulty whether on every occasion the persons speaking should be mentioned or not. Both alternations are equally open to objection. If the delivery is that of one voice the statement of the names of the characters speaking becomes an indispensable condition of intelligibility, but by doing so the expression of pathos throughout suffers violence. If, on the other hand, the delivery is vitally dramatic, and we are carried thereby into the actual situation, a further kind of contradiction can hardly fail to appear. For with the satisfaction of our sense of hearing that of sight puts forward a certain claim of its own. For when we listen to an action we desire to see the acting persons, their demeanour and surroundings; the eye craves for a completed vision, and finds instead before it merely a reciter, who sits or stands peacefully in a private house

with company. Reading aloud or recitation is consequently always an unsatisfying compromise between the unambitious pretensions of private perusal, in which the aspect of realization is absent entirely and all is left to the imagination, and the complete theatrical presentation.

(*b*) *The Art of the Actor*

In conjunction with actual dramatic reproduction there is along with music a second practical art, namely, that of *acting*, the complete development of which belongs entirely to more recent times. Its principle consists in this, that while it summons to its assistance dramatic posture, action, declamation, music, dance, and scenery, it accepts as the predominant mark of its effort human speech and its poetical expression. And this is for poetry in its simplest significance the exclusively just relation. For if mere mimicry or song or dance once begin to assume an independent position of their own, poetry viewed as a fine and creative art is degraded to the position of an instrument, and loses its ascendancy over the in other respects accompanying arts. We will venture to point out a few characteristic distinctions in this connection.

(*α*) The primary phase of the art of acting is to be found among the Greeks. Here, as one aspect of the matter, the art of speech is affiliated with that of sculpture. The acting *dramatis personae* stands before us as an objective figure in his entire bodily realization. In so far as here this statuesque figure is animated, assimilates and expresses the content of the poetry, enters into every movement of personal passion and at the same time asserts it through word and voice, this presentation is more animated and more spiritually transparent than any statue or picture.

As to this quality of living animation we may draw a distinction between two distinct ways of regarding it.

(*αα*) *First*, there is declamation in the sense of artistic speech. Declamation was not carried far among the Greeks; intelligibility is here

what is of most importance. We desire to recognize in the tone of the voice and in the quality of the recitations the characterization of soul-life in its finest shades and transitions, as also in its oppositions and contrasts, in short, in its entire concreteness. The ancients, on the contrary, added a musical accompaniment to declamation, partly to emphasize rhythm, and in part to increase the modulation of the verbal expression. At the same time it is probable that the dialogue was either not at all or only very lightly accompanied. To the reproduction of the choruses, however, the lyric association of music was essential. It is highly probable that singing, by means of its more definite accentuation of the meaning of the language used in the choice strophes and antistrophes, made the same more intelligible; only under such an assumption can I myself understand how it was possible for a Greek audience to follow the choruses of either Æschylus or Sophocles. I admit that such choruses might not necessarily present to a Greek all the difficulties *we* ourselves experience; at the same time I confess that, though I know the German language well and am not wholly destitute of imagination, German lyrics written in the same style, if declaimed from the stage, even with the full accompaniment of song, would still be far from wholly intelligible.

(*ββ*) A *further* means of interpretation is supplied by the pose and movement of the body. In this respect it is worth noticing that with the Greeks the play of facial expression is entirely absent, by reason of the fact that their actors wore masks. The facial contour returned an unalterable sculpturesque image, the plastic outlines of which were as unable to assimilate the varied expression of particular states of soul, as to reproduce the acting characters, which fought through a pathos securely fixed and universal in the nature of its dramatic conflict, and neither deepened the substance of this pathos to the ideal intensity of our modern emotional life, nor suffered it to expand into all the particularization of the world of

dramatic individualities now in vogue. The action was equally simple, for which reason we do not possess any tradition of famous Greek mimes. Sometimes the poet himself was actor; both Sophocles and Aristophanes are examples. To some extent the mere citizen, who was not strictly a professional actor at all, took a part in tragedy. As a set-off to such difficulties the choric songs were accompanied with the dance, a procedure which can only appear frivolous to us Germans in the view we generally take of the dance. With the Greeks it belonged as an essential feature to their theatrical performances.

(*γγ*) To summarize, then, we find that among the ancients not only was the poetical claim of language, and the intelligible expression of general emotional states, freely admitted, but also the external realization received the most complete elaboration by means of musical accompaniment and the dance. A concrete unity of this kind gives to the entire presentation a plastic character. What is spiritual is not on its own account idealized as part of a personal soul-life, nor is it expressed under such a mode of particularization; the main effect is to bring about its complete affiliation and reconciliation with the external aspect of sensuous appearance whose correspondent claim is equally recognized.

(*β*) In rivalry with music and the dance speech suffers injury, in so far as it ought to remain the *spiritual* expression of spirit. Our modern art of the theatre has consequently succeeded in liberating itself from such features. The poet is by this means exclusively placed in a relation to the actor simply, who, by his declamation, play of facial expression, and posture, has to represent to vision the poetical work. This relation of the author to the external material is, however, in its contrast to other arts, quite unique. In painting and sculpture it is the artist himself, who executes his conceptions in colour, bronze, or marble; and although musical execution is dependent

upon the hands and voices of others, yet the feature thus added, albeit, of course, the element of soul in the delivery ought not to be absent, is none the less, to a more or less degree, overwhelmingly mechanical technique and virtuosity.[22] The actor, on the contrary, appears before us in the entire personality which combines his bodily presence, physiognomy, voice, and so forth, and it is his function to coalesce absolutely with the character he portrays.

(*αα*) In this respect the poet has the right to demand of the actor that he enters with all his faculties into the part he receives, without adding thereto anything peculiar to himself, that, in short, he acts in complete consonance with the creative conception and means of its display supplied by the poet. The actor ought, in fact, to be the instrument upon which the author plays, an artist's brush which absorbs all colours and returns the same unchanged. Among the ancients this was more easily achieved for the reason that declamation, as above stated, was mainly restricted to clarity of meaning, and music looked after the aspect of rhythm, while masks concealed the faces, and, moreover, not much scope was left to the action. Consequently, the actor could without real difficulty conform in his delivery to a universal tragic pathos; and although too, in comedy, portraits of living people such as Socrates, Nicias, Creon, and so forth, had to be represented, in a real measure the masks reproduced characteristic traits with sufficient force, and further we should note that a detailed individualization was less necessary, inasmuch as the comic poets, as a rule, merely introduced such characters in order to represent general tendencies of the time.

(*ββ*) The position is different in the modern theatre. Here, to start with, we have no masks or musical accompaniment, but have instead of these the play of facial expression, the variety of pose, and a richly modulated style of declamation. For, on the one hand, human passions, even when they are expressed by the poet in a more general and typical characterization, have

none the less to be asserted as part of an inner and personal life; and for the rest our modern characters receive, for the most part, a far more extended compass of particularization, the distinctively appropriate expression of which has in the same way to be placed before us with all the animation of present life. The characters of Shakespeare are, above all, entire men, standing before us in distinctively unique personality, so that we require of our actors that they, for their part, give us back the entire impression of such complete creations. There is no specific rôle here that does not require a definite kind of expression fitted to it, and which covers in fact every feature of its display, whether we regard that which we cannot see or that which we do, whether it be in the tone of the voice, the mode of delivery, gesticulation, or facial expression. For this reason, apart from the nature of the dialogue, the varied character of the pose and gesture, through every possible shade, receives an entirely new significance. In fact, the modern poet leaves to the actor self-expression here much that the ancients would have expressed in words. Take the example of the final scene of Wallenstein. The old Octavio has assisted materially in the downfall of Wallenstein. He finds him treacherously murdered by the machinations of Buttler, and at the very moment when the Countess Terzky makes the announcement that she has taken poison, an imperial letter arrives. Gordon, after reading the same, hands it to Octavio with a glance of reproach, adding the words, "To the Lord Piccolomini." Octavio is confounded, and, pained to the heart, glances heavenwards. That which Octavio experiences in this reward for a service, for the bloody issue of which he himself is mainly responsible, is in this passage not expressed in so many words, but is left solely to the gesture of the actor.

(*γγ*) Owing to demands of this kind made by our modern art of acting, poetry may, relatively to the material of its presentation, not unfrequently opens up difficulties unknown to the ancients. In other words, the actor,

being the man he is, possesses, in respect to voice, figure, physiognomical expression, as everybody else, his native peculiarities, which he is compelled to set on one side, either owing to their incompatibility with a pathos of universal import and a really typical characterization, or to bring them into harmony with the more complete personalities of a type of poetry rich in its power of individualization.

Actors claim the title of artists, and receive all the honours of an artistic profession. According to our modern ideas, no taint of any sort, whether ethical or social, is implied in the fact of being a dramatic actor. This view is the right one. The profession demands conspicuous talent, intelligence, perseverance, energy, practice, knowledge, and, indeed, its highest attainment is impossible without the rare qualities of genius. The actor has not only to assimilate profoundly the spirit of the poet and the part he accepts, and to make his own individuality conform entirely to the same, both inwardly and outwardly; he has, over and above this, in many respects to supplement the part with his own creative insight, to fill in gaps, to discover modes of transition, and generally, by his performance, to interpret the poet by making visibly and vitally present and intelligible meanings which lie beneath the surface, or the less obvious touches of a master's hand.

(*c*) *The Theatrical Art which is more Independent of Poetical Composition*

Finally, we shall have that further, or *third* aspect of the art in its actual employment, where it liberates itself from the exclusive precedency of articulate poetry, and accepts as an independent end what was previously, to a more or less extent, a mere accompaniment or instrument, and elaborates the same on its own account. To carry out this emancipation, music and the dance are quite as much essential features of the dramatic development as the art of the actor simply.

(α) In respect to this change in the art, there are broadly speaking two systems. The first, according to which the performer tends to be simply in spirit and body the living instrument of the poet, we have already referred to. The French, who make much of professional rôles[23] and schools, and are, as a rule, more typical in their theatrical representations, have shown an exceptional fidelity to this system in their tragedy and *haute comédie*. What we may define here as the position of the art of acting reversed consists in this, that the entire creation of the poet now tends to be purely an appendage or frame to and for the natural endowment, technical ability, and art of the actor. It is by no means uncommon to hear actors make the demand that poets should write expressly for them. The soul function of poetical composition is, in this view, to give the artist an opportunity to display and unfold in all its brilliance his emotional powers and art, to let us see the final outcome of his particular individuality. Among the Italians, the *commedia dell' arte* belongs to this type. Here, no doubt, we have certain definite types of character such as those of the *arlecchino*, *dottore*, and the like, with appropriate situations and series of scenes; the more detailed execution is, however, almost entirely left to the discretion of the actors. Among ourselves, the dramatic pieces of Iffland and Kotzebue, and many others besides, though in large measure regarded as poetry, unimportant or even bad compositions, nevertheless offer such an opportunity for the creative powers of the actor, who is compelled to initiate and shape something from such generally sketchy and artificial productions, which on account of a vital and independent performance of this kind receives a unique interest exclusively united to one and no other artist. It is here, more especially, that we find our much belauded realistic effects are displayed, a style carried to such lengths that a mere mumble and whisper of articulate speech, quite impossible to follow, will pass as an admirable performance. In protest to such a style, Goethe translated Voltaire's "Tancred" and

"Mahomet" for the Weimar stage, in order to compel its actors to drop this vulgar naturalism, and accustom themselves to a more noble exposition. And this is invariably the case with the French, who, even in all the animation of the farce, always keep the audience in view, and throughout address themselves to it. As a matter of fact, mere realism and imitation of our everyday expression is as little exhaustive of the real problem as the mere intelligibility and clever use made of characterization. If an actor seeks to produce a really artistic effect in such cases, he will have to extend his powers to a genial virtuosity similar to that I have described already in a previous passage when referring to musical execution.[24]

(*β*) A *second* province belonging to the type under consideration is that of the modern *opera*, in the direction, at least, which it more and more is inclined to take. In other words, although in opera, generally speaking, the music is of most importance, which of course possesses a content in partnership with the poetry and the libretto, albeit it treats and executes the same freely as it thinks best, yet in more recent times, and particularly among ourselves, it has become increasingly an affair of luxurious display. It has carried its *accessoires*, in the splendour of its decorations, the pomp of its costumes, the completeness of its choruses and their grouping, to a degree of independence that throws all else into the shade. It was a magnificence of this kind, sufficiently criticized among ourselves, which Cicero long ago complains of when referring to Roman tragedy. In tragedy, where the poetry is always the most essential thing, such a lavish display of the sensuous side of things is no doubt not in its right place, although Schiller, in his "Maid of Orleans," shows a tendency here to run astray. In the opera, on the contrary, with its sensuous exuberance of song and the melodic, thundering chorus of voices and instruments, we may with more reason admit such an emphasized charm of external embellishment and display. If the decorations are splendid, then the groups and processions, to

give point to them, must be equally gorgeous, and everything else must be adapted to the same scale. The subject most suited to a sensuous luxuriance of this kind, which, no doubt, is always some indication of the decline of genuine art, is that part of the entire performance which inclines to the wonderful, fantastic, or fairy tale. Mozart, in his “Magic Flute,” has supplied us with an example which is not too extravagant, and is worked out on completely artistic lines. At the same time, we may entirely exhaust all the arts of scenic display, costume, instrumentation and the rest, but the fact remains that, if we are not really in earnest with that part of the content which concerns real dramatic action, the impression upon us can be at the strongest merely that of a perusal of the fairy-tale of “The Thousand and One Nights.”

(γ) The same observations apply to the modern *Ballet*, which above all is most suited to fairy-land and miracle of all kinds. Here, too, we note as one supreme feature, quite apart from the picturesque beauty of the grouping and tableaux, the kaleidoscopic splendour and fascination of the decorations, costumes, and lighting, to an extent that ordinary persons find themselves transported into a world in which common sense and the laws and pressure of our daily life vanish altogether. As a further aspect of these performances, connoisseurs in such subjects will go into ecstacies over the elaborately trained dexterity and virtuosity of legs, which is nowadays an essential feature of the dance. If, however, any more spiritual significance is to flash athwart such mere physical agility, which we have reduced to the final ultimatum of senselessness and ideal poverty, we ought to have associated with the complete command over all the executive difficulties implied a real measure and euphony of movement, a freedom and grace such as finds a response in the soul; and it is only very rarely that we do so. As a further element in association with the dance here, which stands in the place of the choruses and solos of the opera, we find as real expression of

action the Pantomime. This, however, in proportion as our modern dance has advanced in technical dexterity, has fallen from the rank which it once possessed, and, indeed, has so deteriorated that the very thing tends once more to drop out of the modern ballet altogether, which is alone able to lift the same into the free domain of art.

3. THE TYPES OF DRAMATIC POETRY AND THE PRINCIPAL PHASES OF THEIR HISTORICAL DEVELOPMENT.

Viewing for a moment the course of our present inquiry in retrospect, it will be seen that we have, *first,* established the principle of dramatic poetry in its widest and more specific characteristics, and, further, in its relation to the general public. *Secondly*, we deduced from the fact of the drama's presenting an action distinct and independent in its actually visible development the conclusion that a fully complete sensuous reproduction is also essential, such as is for the first time possible under artistic conditions in the theatrical performance. In order that the action, however, may adapt itself to an external realization of this kind, it is necessary that both in poetic conception and detailed execution it should be absolutely definite and complete. This is only effected, our *third* point, by resolving dramatic poetry into *particular types*, receiving their typical character, which is in part one of opposition and also one of mediatory relation to such opposition, from the distinction, in which not only the end but also the characters, as also the conflict and entire result of the action, are manifested. The most important aspects emphasized by such distinction and subject to an historical development are those peculiar to tragedy and comedy respectively, as also the comparative value of either mode of composition. This inquiry in dramatic poetry is for the first time so essentially important that it forms the basis of classification for the different types.

In considering more closely the nature of these distinctions we shall do well to discuss their subject-matter in the following order.

First, we must define the general principle of tragedy, comedy, and the so-called drama.

Secondly, we must indicate the character of ancient and modern dramatic poetry, to the contrast between which the distinctive relation of the above-named types is referable in their historical development.

Thirdly, we will attempt, in conclusion, to examine the concrete modes, which these types, though mainly comedy and tragedy, are able to exhibit within the boundary of this opposition.

(*a*) *The Principle of Tragedy, Comedy, and the Drama, or Social Play*

The essential basis of differentiation among the types of epic poetry is to be found in the distinction whether the essentially substantive displayed in the epic manner is expressed in its universality, or is communicated in the form of objective characters, exploits, and events. In contrast to this, the classification of lyric poetry, in its series of varied modes of expression, is dependent upon the degree and specific form in which the content is assimilated in more or less stable consistency with the soul experience, according as such content asserts this intimate life. And, finally, dramatic poetry, which accepts as its centre of significance the collision of aims and characters, as also the necessary resolution of such a conflict, cannot do otherwise than deduce the principle of its separate types from the relation in which *individual persons* are placed relatively to their purpose and its content. The definition of this relation is, in short, the decisive factor in the determination of the particular mode of dramatic schism and the issue therefrom, and consequently presents the essential type of the entire process in its animated and artistic display. The fundamental points we have to examine in this connection are, speaking broadly, those phases or features

in the process, the mediation of which constitutes the essential purport of every true action. Such are from one point of view the substantively sound and great, the fundamental stratum of the realized divine nature in the world, regarded here as the genuine and essentially eternal content of individual character and end. And, on its other side, we have the *personal conscious life* simply as such in its unhampered power of self-determination and freedom. Without doubt, essential and explicit truth is asserted in dramatic poetry; it matters not in what form it may be manifested from time to time in human action. The specific type, however, within which this activity is made visible receives a distinct or, rather, actually opposed configuration, according as the aspect of substantive worth or in its opposition thereto, that of individual caprice, folly, and perversity is retained as the distinctive *modus* of operation either in individuals, actions, or conflicts.

We have therefore to consider the principle in its distinctive relation to the following types:

First, as associated with tragedy in its substantive and primitive form.

Secondly, in its relation to comedy, in which the life of the individual soul as such in volition and action, as well as the external factor of contingency, are predominant over all relations and ends.

Thirdly, in that to the drama, the theatrical piece in the more restricted use of the term, regarding such as the middle term between the two first-mentioned types.

(*α*) With respect to *tragedy*, I will here confine myself to a consideration of only the most general and essential characteristics, the more concrete differentiation of which can only be made clear by a review of the distinctive features implied in the stages of its historical process.

(*αα*) The genuine content of tragic action subject to the *aims* which arrest tragic characters is supplied by the world of those forces which carry in

themselves their own justification, and are realized substantively in the volitional activity of mankind. Such are the love of husband and wife, of parents, children, and kinsfolk. Such are, further, the life of communities, the patriotism of citizens, the will of those in supreme power. Such are the life of churches, not, however, if regarded as a piety which submits to act with resignation, or as a divine judicial declaration in the heart of mankind over what is good or the reverse in action; but, on the contrary, conceived as the active engagement with and demand for veritable interests and relations. It is of a soundness and thoroughness consonant with these that the really tragical *characters* consist. They are throughout that which the essential notion of their character enables them and compels them to be. They are not merely a varied totality laid out in the series of views of it proper to the epic manner; they are, while no doubt remaining also essentially vital and individual, still only the one power of the particular character in question, the force in which such a character, in virtue of its essential personality, has made itself inseparably coalesce with some particular aspect of the capital and substantive life-content we have indicated above, and deliberately commits himself to that. It is at some such elevation, where the mere accidents of unmediated[25] individuality vanish altogether, that we find the tragic heroes of dramatic art, whether they be the living representatives of such spheres of concrete life or in any other way already so derive their greatness and stability from their own free self-reliance that they stand forth as works of sculpture, and as such interpret, too, under this aspect the essentially more abstract statues and figures of gods, as also the lofty tragic characters of the Greeks more completely than is possible for any other kind of elucidation or commentary.

Broadly speaking, we may, therefore, affirm that the true theme of primitive tragedy is the godlike.[26] But by godlike we do not mean the Divine, as implied in the content of the religious consciousness simply as

such, but rather as it enters into the world, into individual action, and enters in such a way that it does not forfeit its substantive character under this mode of realization, nor find itself converted into the contradiction of its own substance.[27] In this form the spiritual substance of volition and accomplishment is ethical life.[28] For what is ethical, if we grasp it, in its direct consistency — that is to say, not exclusively from the standpoint of personal reflection as formal morality — is the divine in its secular or world realization, the substantive as such, the particular no less than the essential features of which supply the changing content of truly human actions, and in such action itself render this their essence explicit and actual.

(*ββ*) These ethical forces, as also the characters of the action, are *distinctively defined* in respect to their content and their individual personality, in virtue of the principle of differentiation to which everything is subject, which forms part of the objective world of things. If, then, these particular forces, in the way presupposed by dramatic poetry, are attached to the external expression of human activity, and are realized as the determinate aim of a human pathos which passes into action, their concordancy is cancelled, and they are asserted *in contrast* to each other in interchangeable succession. Individual action will then, under given conditions, realize an object or character, which, under such a presupposed state, inevitably stimulates the presence of a pathos[29] opposed to itself, because it occupies a position of unique isolation in virtue of its independently fixed definition, and, by doing so, brings in its train unavoidable conflicts. Primitive tragedy, then, consists in this, that within a collision of this kind both sides of the contradiction, if taken by themselves, are *justified*; yet, from a further point of view, they tend to carry into effect the true and positive content of their end and specific characterization merely as the negation and *violation* of the other equally legitimate power,

and consequently in their ethical purport and relatively to this so far fall under *condemnation.*

I have already adverted to the general ground of the necessity of this conflict. The substance of ethical condition is, when viewed as concrete unity, a totality of *different* relations and forces, which, however, only under the inactive condition of the gods in their blessedness achieve the works of the Spirit in enjoyment of an undisturbed life. In contrast to this, however, there is no less certainly implied in the notion of this totality itself an impulse to move from its, in the first instance, still abstract ideality, and transplant itself in the real actuality of the phenomenal world. On account of the nature of this primitive obsession,[30] it comes about that mere difference, if conceived on the basis of definite conditions of individual personalities, must inevitably associate with contradiction and collision. Only such a view can pretend to deal seriously with those gods which, though they endure in their tranquil repose and unity in the Olympus and heaven of imagination and religious conception, yet, in so far as they are actual,[31] viewed at least as the energic in the definite pathos of a human personality, participate in concrete life, all other claims notwithstanding, and, in virtue of their specific singularity and their mutual opposition, render both blame and wrong inevitable.

(*γγ*) As a result of this, however, an unmediated contradiction is posited, which no doubt may assert itself in the Real, but, for all that, is unable to maintain itself as that which is wholly substantive and verily real therein; which rather discovers, and only discovers, its essential justification in the fact that it is able to *annul* itself as such contradiction. In other words, whatever may be the claim of the tragic final purpose and personality, whatever may be the necessity of the tragic collision, it is, as a consequence of our present view, no less a claim that is asserted — this is our *third* and last point — by the tragic resolution of this division. It is through *this* latter

result that Eternal Justice is operative in such aims and individuals under a mode whereby it restores the ethical substance and unity in and along with the downfall of the individuality which disturbs its repose. For, despite the fact that individual characters propose that which is itself essentially valid, yet they are only able to carry it out under the tragic demand in a manner that implies contradiction and with a onesidedness which is injurious. What, however, is substantive in truth, and the function of which is to secure realization, is not the battle of particular unities, however much such a conflict is essentially involved in the notion of a real world and human action; rather it is the reconciliation in which definite ends and individuals unite in harmonious action without mutual violation and contradiction. That which is abrogated in the tragic issue is merely the *one-sided* particularity which was unable to accommodate itself to this harmony, and consequently in the tragic course of its action, through inability to disengage itself from itself and its designs, either is committed in its entire totality to destruction or at least finds itself compelled to fall back upon a state of resignation in the execution of its aim in so far as it can carry this out. We are reminded of the famous dictum of Aristotle that the true effect of tragedy is to excite and purify *fear* and *pity.* By this statement Aristotle did not mean merely the concordant or discordant feeling with anybody's private experience, a feeling simply of pleasure or the reverse, an attraction or a repulsion, that most superficial of all psychological states, which only in recent times theorists have sought to identify with the principle of assent or dissent as ordinarily expressed. For in a work of art the matter of exclusive importance should be the display of that which is conformable with the reason and truth of Spirit; and to discover the principle of this we have to direct our attention to wholly different points of view. And consequently we are not justified in restricting the application of this dictum of Aristotle merely to the emotion of fear and pity, but should relate it to the principle of

the *content* the appropriately artistic display of which ought to purify such feelings. Man may, on the one hand, entertain fear when confronted with that which is outside him and finite; but he may likewise shrink before the power of that which is the essential and absolute subsistency of social phenomena.[32] That which mankind has therefore in truth to fear is not the external power and its oppression, but the ethical might which is self-defined in its own free rationality, and partakes further of the eternal and inviolable, the power a man summons against his own being when he turns his back upon it. And just as fear may have two objectives, so also too compassion. The first is just the ordinary sensibility — in other words, a sympathy with the misfortunes and sufferings of another, and one which is experienced as something finite and negative. Your countrified cousin is ready enough with compassion of this order. The man of nobility and greatness, however, has no wish to be smothered with this sort of pity. For just to the extent that it is merely the nugatory aspect, the negative of misfortune which is asserted, a real depreciation of misfortune is implied. True sympathy, on the contrary, is an accordant feeling with the ethical claim at the same time associated with the sufferer — that is, with what is necessarily implied in his condition as affirmative and substantive. Such a pity as this is not, of course, excited by ragamuffins and vagabonds. If the tragic character, therefore, just as he aroused our fear when contemplating the might of violated morality, is to awake a tragic sympathy in his misfortune, he must himself essentially possess real capacity and downright character. It is only that which has a genuine content which strikes the heart of a man of noble feeling, and rings through its depths. Consequently we ought by no means to identify our interest in the tragic *dénouement* with the simple satisfaction that a sad story, a misfortune merely as misfortune, should have a claim upon our sympathy. Feelings of lament of this type may well enough assail men on occasions of wholly external contingency and

related circumstance, to which the individual does not contribute, nor for which he is responsible, such cases as illness, loss of property, death, and the like. The only real and absorbing interest in such cases ought to be an eager desire to afford immediate assistance. If this is impossible, such pictures of lamentation and misery merely rack the feelings. A veritable tragic suffering, on the contrary, is suspended over active characters entirely as the consequence of their own act, which as such not only asserts its claim upon us, but becomes subject to blame through the collision it involves, and in which such individuals identify themselves heart and soul.

Over and above mere fear and tragic sympathy we have therefore the feeling of *reconciliation*, which tragedy is vouched for in virtue of its vision of eternal justice, a justice which exercises a paramount force of absolute constringency on account of the relative claim of all merely contracted aims and passions; and it can do this for the reason that it is unable to tolerate the victorious issue and continuance in the truth of the objective world of such a conflict with and opposition to those ethical powers which are fundamentally and essentially concordant.[33] Inasmuch as then, in conformity with this principle, all that pertains to tragedy pre-eminently rests upon the contemplation of such a conflict and its resolution, dramatic poetry is — and its entire mode of presentation offers a proof of the fact — alone able to make and completely adapt its form throughout its entire course and compass to the principle of the art product. And this is the reason why I have only now found occasion to discuss the tragic mode of presentation, although it extends an effective force, if no doubt one of subordinate degree, in many ways over the other arts.

(*β*) In tragedy then that which is eternally substantive is triumphantly vindicated under the mode of reconciliation. It simply removes from the contentions of personality the false one-sidedness, and exhibits instead that which is the object of its volition, namely, positive reality, no longer under

an asserted mediation of opposed factors, but as the real support of consistency.[34] And in contrast to this in *comedy* it is the purely *personal experience*, which retains the mastery in its character of infinite self-assuredness.[35] And it is only these two fundamental aspects of human action which occupy a position of contrast in the classification of dramatic poetry into its several types. In tragedy individuals are thrown into confusion in virtue of the abstract nature of their sterling volition and character, or they are forced to accept that with resignation, to which they have been themselves essentially opposed. In comedy we have a vision of the victory of the intrinsically assured stability of the wholly personal soul-life, the laughter of which resolves everything through the medium and into the medium of such life.

(*αα*) The general basis of comedy is therefore a world in which man has made himself, in his conscious activity, complete master of all that otherwise passes as the essential content of his knowledge and achievement; a world whose ends are consequently thrown awry on of their own lack of substance. A democratic folk, with egotistic citizens, litigious, frivolous, conceited, without faith or knowledge, always intent on gossip, boasting and vanity — such a folk is past praying for; it can only dissolve in its folly. But it would be a mistake to think that any action that is without genuine content is therefore comic because it is void of substance. People only too often in this respect confound the merely *ridimlous* with the true comic. Every contrast between what is essential and its appearance, the object and its instrument, may be ridiculous, a contradiction in virtue of which the appearance is absolutely cancelled, and the end is stultified in its realization. A profounder significance is, however, implied in the comic. There is, for instance, nothing comic in human crime. The satire affords a proof of this, to the point of extreme aridity, no matter how emphatic may be the colours in which it depicts the condition of the actual world in its

contrast to all that the man of virtue ought to be. There is nothing in mere folly, stupidity, or nonsense, which in itself necessarily partakes of the comic, though we all of us are ready enough to laugh at it. And as a rule it is extraordinary what a variety of wholly different things excite human laughter. Matters of the dullest description and in the worst possible taste will move men in this way; and their laughter may be excited quite as much by things of the profoundest importance, if only they happen to notice some entirely unimportant feature, which may conflict with habit and ordinary experience. Laughter is consequently little more than an expression of self-satisfied shrewdness; a sign that they have sufficient wit to recognize such a contrast and are aware of the fact. In the same way we have the laughter of the scoffer, the scornful and desperation itself. What on the other hand is inseparable from the comic is an infinite geniality and confidence[36] capable of rising superior to its own contradiction, and experiencing therein no taint of bitterness or sense of misfortune whatever. It is the happy frame of mind, a hale condition of soul, which, fully aware of itself, can suffer the dissolution of its aims and realization. The unexpansive type of intelligence is on the contrary least master of itself where it is in its behaviour most laughable to others.

(*ββ*) In considering with more detail the kind of content which characterizes and educes the object of comic action, I propose to limit myself to the following points of general interest.

On the *one* hand there are human ends and characters essentially devoid of substantive content and contradictory. They are therefore unable to achieve the former or give effect to the latter. Avarice, for example, not only in reference to its aim, but also in respect to the petty means which it employs, is clearly from the first and fundamentally a vain shadow. It accepts what is the dead abstraction of wealth, money simply as such, as the *summum bonum*, the reality beyond which it refuses to budge; and it

endeavours to master this frigid means of enjoyment by denying itself every other concrete satisfaction, despite the fact too that, in the impotency of its end no less than the means of its achievement, it is helpless when confronted with cunning and treachery, and the like. In such a case then, if anyone identifies *seriously* his personal life with a content so essentially false, to the extent of a man confining the embrace of his soul-life to that exclusively, and in the result, if the same is swept away as his foot-hold, the more he strives to retain that former foot-hold, the more the life collapses in unhappiness — in such a picture as this what is most vital to the comic situation fails, as it does in every case where the predominant factors are simply on the one side the painfulness of the actual conditions, and on the other scorn and pleasure in such misfortune. There is therefore more of the true comic in the case where, it is true, aims intrinsically mean and empty would like to be achieved with an appearance of earnest solemnity and every kind of preparation, but where the individual himself, when he falls short of this, does not experience any real loss because he is conscious that what he strove after was really of no great importance, and is therefore able to rise superior with spontaneous amusement above the failure.

A situation which is the reverse of this occurs where people vaguely grasp at aims and a personal impression of real substance, but in their own individuality, as instruments to achieve this, are in absolute conflict with such a result. In such a case what substance there is only exists in the individual's imagination, becomes a mere appearance to himself or others, which no doubt offers the show and virtue of what is thus of material import, but for this very reason involves end and personality, action and character in a contradiction, by reason of which the attainment of the imaged end or characterization is itself rendered impossible. An example of this is the "Ecclesiazusae" of Aristophanes, where the women who seek to

advise and found a new political constitution, retain all the temperament and passions of women as before.

We may add to the above two divisions of classification, as a distinct basis for yet *another*, the use made of external accident, by means of the varied and extraordinary development of which situations are placed before us in which the objects desired and their achievement, the personal character and its external conditions are thrown into a comic contrast, and lead to an equally comic resolution.

(*γγ*) But inasmuch as the comic element wholly and from the first depends upon contradictory contrasts, not only of ends themselves on their own account, but also of their content as opposed to the contingency of the personal life and external condition, the action of comedy requires a *resolution* with even more stringency than the tragic drama. In other words, in the action of comedy the contradiction between that which is essentially true and its specific realization is more fundamentally asserted.

That which, however, is abrogated in this resolution is not by any means either the *substantive* being or the *personal* life as such.

And the reason of this is that comedy too, viewed as genuine art, has not the task set before it to display through its presentation what is essentially rational as that which is intrinsically perverse and comes to naught, but on the contrary as that which neither bestows the victory, nor ultimately allows any standing ground to folly and absurdity, that is to say the false contradictions and oppositions which also form part of reality. The masculine art of Aristophanes, for instance, does not turn into ridicule what is truly of ethical significance in the social life of Athens, namely genuine philosophy, true religious faith, but rather the spurious growth of the democracy, in which the ancient faith and the former morality have disappeared, such as the sophistry, the whining and querulousness of

tragedy, the inconstant gossip, the love of litigation and so forth; in other words, it is those elements directly opposed to a genuine condition of political life, religion and art, which he places before us in their suicidal folly. Only in more modern times do we find in such a writer as Kotzebue the baseness possible which throws over moral excellence, and spares and strives to maintain that which only exists under a condition of sufferance. To as little extent, however, ought the individual's private life suffer substantial injury in comedy. Or to put it otherwise, if it is merely the appearance and imagined presence of what is substantive, or if it is the essentially perverse and petty which is asserted, yet in the essential self stability of individual character the more exalted principle remains, which in its freedom reaches over and beyond the overthrow of all that such finite life comprises, and continues itself in its character of self-security and self-blessedness. This subjective life that we above all identify with comic personality has thus become master of all the phenomenal presence of the real. The mode of actual appearance adequate to what is, so to speak, substantive, has vanished out of it; and, if what is essentially without fundamental subsistence comes to naught with its mere pretence of being that which it is not, the individual asserts himself as master over such a dissolution, and remains at bottom unbroken and in good heart to the end.[37]

(*γ*) Midway between tragedy and comedy we have furthermore a *third* fundamental type of dramatic poetry, which is, however, of less distinctive importance, despite the fact that in it the essential difference between what is tragic and comic makes an effort to construct a bridge of mediation, or at least to effect some coalescence of both sides in a concrete whole without leaving either the one or the other in opposed isolation.

(*αα*) To this class we may, for example, refer the *Satyric* drama of the ancients, in which the principal action itself at least remains of a serious if not wholly tragic type, while the chorus of its Satyrs is in contrast to this

treated in the comic manner. We may also include in such a class the tragic-comedy. Plautus gives an example of this in his "Amphitryo," and indeed in the prologue, through verses given to Mercury, asserts this fact; the declamation runs as follows:

Quid contraxistis frontem? Quia Tragoediam
Dini futuram hanc? Deus sum: commutavero
Eamdem hanc, si voltis: faciam, ex Tragoedia
Comoedia ut sit, omnibus eisdem versibus.
Faciam ut conmista sit Tragicocomoedia.

He offers us as a reason for this intermixture the fact, that while gods and kings are represented among the *dramatis personae*, we have also in comic contrast to this the figure of the slave Sofia. With yet more frequency in modern dramatic poetry we have the interplay of tragic and comic situation; and this is naturally so, because in modern compositions the principle of an intimate personal life has its place too in tragedy, the principle which is asserted by comedy in all its freedom, and from the first has been predominant, forcing as it does into the background the substantive character of the content in which the ethical forces, I have referred to previously, are paramount.

(*ββ*) The profounder mediation, however, of tragic and comic composition in a new whole does not consist in the juxtaposition or alteration of these contradictory points of view, but in a mutual accommodation, which blunts the force of such opposition. The element of subjectivity, instead of being exercised with all the perversity of the comic drama, is steeped in the seriousness of genuine social conditions and substantial characters, while the tragic steadfastness of volition and the depth of collisions is so far weakened and reduced that it becomes compatible with a reconciliation of interests and a harmonious union of

ends and individuals. It is under such a mode of conception that in particular the modern play and drama arise. The profound aspect of this principle, in this view of the playwright, consists in the fact that, despite the differences and conflicts of interests, passions and characters, an essentially harmonious reality none the less results from human action. Even the ancient world possesses tragedies, which accept an issue of this character. Individuals are not sacrificed, but maintained without serious catastrophe. In the "Eumenides" of Æschylus, for example, both parties there brought to judgment before the Areopagus, namely Apollo and the avenging Furies, have their claims to honorable consideration vindicated. Also in the "Philoctetes" the conflict between Neoptolemos and Philoctetes is disposed of through the divine interposition of Hercules and the advice he gives. They depart reconciled for Troy. In this case, however, the accommodation is due to a *deus ex machinâ* and the actual source of such is not traceable to the personal attitude of the parties themselves. In the modern play, however, it is the individual characters alone who find themselves induced by the course of their own action to such an abandonment of the strife, and to a reciprocal reconciliation of their aims and personalities. From this point of view the "Iphigeneia" of Goethe is a genuine model of a play of this kind, and it is more so than his "Tasso," in which in the first place the reconciliation with Antonio is rather an affair of temperament and personal acknowledgment that Antonio possesses the genuine knowledge of life, which is absent from the character of Tasso, and along with this that the claim of ideal life, which Tasso had rigidly adhered to in its conflict with actual conditions, adaptability and grace of manners, retains its force throughout with an audience merely in an ideal sense, and relatively to actual conditions at most asserts itself as an excuse for the poet and a general sympathy for his position.

(*γγ*) As a rule, however, the boundary lines of their intermediate type fluctuate more than is the case with tragedy or comedy. It is also exposed to a further danger of breaking away from the true dramatic type, or ceasing to be genuine poetry. In other words, owing to the fact that the opposing factors, which have to secure a peaceful conclusion from out of their own division, are from the start not antithetical to one another with the emphasis asserted by tragedy; the poet is for this reason compelled to devote the full strength of his presentation to the psychological analysis of character, and to make the course of the situations a mere instrument of such characterization. Or, as an alternative, he admits a too extensive field for the display of the material aspect of historical or ethical conditions; and, under the pressure of such material, he tends to restrict his effort to keep the attention alive to the interest of the series of events evolved alone. To this class of composition we may assign a host of our more recent theatrical pieces, which rather aim at theatrical effect than claim to be poetry. They do not so much seek to affect us as genuine poetical productions as to reach our emotions generally as men and women; or they aim on the one hand simply at recreation, and on the other at the moral education of public taste; but while doing so they are almost equally concerned to provide ample opportunity to the actor for the display of his trained art and virtuosity in the most brilliant manner.

(*b*) *The Difference between Ancient and Modern Dramatic Poetry*

The same principle which offered us a basis for the classification of dramatic art into tragedy and comedy also will give us the essential points of arrest in the history of their development. The progress we find in this course of evolution can only appear after we have placed such particular phases in the process side by side for comparison and analysis. They subsist, in short, in the notion of dramatic action, with the result that on the one hand the entire composition and its theatrical execution emphasizes

what is *substantive* in the ends, conflicts, and characters, and on the other that the *personal* factor of conscious and individual life constitutes the focal centre throughout.

(*α*) With regard to such an inquiry we may at once in the present work, which does not attempt to include an exhaustive history of art, leave out altogether those origins of dramatic art which we find among Oriental peoples. Despite the considerable progress made by Eastern poetry in the epic and certain types of lyrical composition the entire world-outlook of such peoples nevertheless from the first excludes an artistic development favourable to dramatic art. And the reason is that to genuine *tragic* action it is essential that the principle of *individual* freedom and independence, or at least that of self-determination, the will to find in the self the free cause and source of the personal act and its consequences, should already have been aroused; and we may observe that to a still more emphatic degree is this free claim of the personal life and its self-recognized *imperium* a necessary condition to the appearance of comedy. In the East we find in neither case such a condition satisfied. In particular remoteness from any and every attempt at real dramatic self-expression is that imposing sublimity of Mohammedan poetry, although from a certain point of view it is capable with real power of vindicating the claim of individual independence. But it necessarily fails, because it is an equally essential assumption of it that the One substantive Power overrules every created being and determines his irreversible destiny, and with all the more irresistible fatality in proportion as such a spirit is asserted. The justification of a particular content of individual action and of a personal life which explores its own most intimate substance, in the sense that dramatic art presupposes, is here impossible; indeed it is precisely in Mohammedanism that the subjugation of the individual self to the will of God is the more abstract in proportion as

the One predominant Power, who rules the universe, is more abstractly conceived in his universality, and in the last instance will not tolerate one shred of particularity to remain. We consequently only find origins of dramatic composition among the Chinese and Hindoos. But here, too, so far as our present scanty evidence carries us, these do not so much amount to the execution of any free and individual action; they merely reflect the animated life of events and emotions under the mode of definite situations, which are displayed in their course as they actually happen.

(*β*) The true beginning of dramatic poetry we have consequently to seek among the Hellenes, with whom for the first time and in every respect the principle of free individuality renders the perfect elaboration of the classic type of art possible. Compatibly with this type of art, however, and in its relation to human action, individuality is only so far asserted as it directly demands the free animation of the essential content of human aims. That which pre-eminently is of valid force in ancient drama, therefore, whether it be tragedy or comedy, is the universal and essential content of the end, which individuals seek to achieve. In tragedy this is the ethical claim of human consciousness in view of the particular action in question, the vindication of the act on its own account. And in the old comedy, too, it is in the same way at least the general public interests which are emphasized, whether it be in statesmen and the mode in which they direct the State, questions of peace or war, the general public and its moral conditions, or the condition of philosophy and its decline. And it is owing to this that here neither the varied exposition of personal soul-life and exceptional character, nor the equally exceptional plot and intrigue can obtain the fullest play, nor does the main interest revolve so much around the fate of individuals. In the place of this interest for such particular aspects of the drama above all else sympathy is evoked and claimed for the simple conflict and issue of the

essential powers of life, and for the godlike manifestations of the human heart,[38] as distinctive representatives of which the heroes of tragedy are set before us in much the same way as that in which the figures of comedy make visible the general perversity of mankind, to the expression of which, in the reality of the actual present, even the fundamental institutions of public life have been corrupted.

(γ) In *modern* romantic poetry, on the contrary, it is the individual passion, the satisfaction of which can only be relative to a wholly personal end, generally speaking the destiny of some particular person or character placed under exceptional circumstances, which forms the subject-matter of all importance.

From such a point of view the poetic interest consists in that greatness of characters, which, in virtue of their imaginative power or their disposition and talents, display a spiritual[39] elevation over their situations and actions no less than over the entire wealth of their soul-life, and show it as the real substance of political forces, though often, too, these may be obstructed and, indeed, annihilated in the stress of particular circumstances and the current of events; and we may add that in the greatness of such natures it is not infrequent to find that a power of recovery[40] is further contained. With regard to the particular content of the action in this style of composition it is not therefore the ethical vindication and necessity, but rather the isolated individual and his conditions to which our interest is directed. From a standpoint such as this, therefore, a fundamental motive will arise in such qualities as love and ambition; indeed, crime itself is not excluded. But in the latter case we may easily find rocks ahead difficult indeed to clear. For an out and out criminal, and irrevocably so when he is weak and a thoroughly mean scamp, as is the hero in Milliner's drama, "Crime," is something more than a sorry sight. What we require therefore above all in such cases is at least the formal[41] greatness of character and power of the

personal life which is able to ride out everything that negates it, and which, without denial of its acts or, indeed, without being materially discomposed by them, is capable of accepting their consequences. And on the other side we find that those substantive ends, such as patriotism, family devotion, loyalty, and the rest, are by no means to be excluded, although for the individual persons concerned the main question of importance is not so much the substantive force as their own individuality. But in such cases as a rule they rather form the particular ground upon which such persons, viewed in the light of their private character, take their stand and engage in conflict, rather than have supplied what we may regard as the real and ultimate content of their volition and action.

And further, in conjunction with a personal self-assertion of this type we may have presented the full extension of individual idiosyncrasy, not merely in respect to the soul-life simply, but also in relation to external circumstances and conditions, within which the action proceeds. And it is owing to this that in distinctive form the simple conflicts which characterize more classical dramatic composition, we now meet with the variety and exuberance of the characters dramatized, the unforeseen surprises of the ever new and complicated developments of plot, the maze of intrigue, the contingency of events, and, in a word, all those aspects of the modern drama which claim our attention, and the unfettered appearance of which, as opposed to the overwhelming emphasis attached to what is essentially most fundamental in the content, accentuates the type of romantic art in its distinction from the classic type.

But again, even in the cases above indicated, and despite all this apparently untrammelled particularity, the whole ought to continue to be both dramatic and poetical. In other words, on the one hand, the harshness of the collision, which has to be fought through, ought to be visibly

obliterated, and on the other, pre-eminently in tragedy, the predominant presence of a more exalted order of the world, whether we adopt the conception of Providence or Fatality, ought to plainly discover itself in and through the course and issue of the action.

(*c*) *The Concrete Development of Dramatic Poetry and its Types*

Within the essential distinctions of conception and poetical achievement which we have just considered the different types of dramatic art assert themselves, and, for the first time in such association, and in so far as their development follows either one or the other direction, attain a really genuine completeness. We have, therefore, in concluding the present work, still to concentrate our inquiry upon the concrete mode under which they receive such a configuration.

(*α*) Excluding as we shall do for the reasons already given from our subject-matter the origins of such poetry in Oriental literature, the material of first and fundamental importance which engages our attention, as the most valuable phase of genuine tragedy no less than comedy, is the dramatic poetry of the *Greeks*. In other words, in it for the first time we find the human consciousness is illuminated with that which in its general terms the tragic and comic situation essentially is; and after that these opposed types of dramatic outlook upon human action have been securely and beyond all confusion separated from each other, we mark first in order tragedy, and after that comedy, rise in organic development to the height of their achievement. Of such a successful result the dramatic art of Rome merely returns a considerably attenuated reflection, which does not indeed reach the point secured by the similar effort of Roman literature in epic and lyrical composition. In my examination of the material thus offered my object will be merely to accentuate what is most important, and I shall therefore limit my survey to the tragic point of view of Æschylus and Sophocles, and to Aristophanes so far as comedy is concerned.

(*αα*) Taking, then, tragedy first, I have already stated that the fundamental type which determines its entire organization and structure is to be sought for in the emphasis attached to the substantive constitution of final ends and their content, as also of the individuals dramatized and their conflict and destiny.

In the tragic drama we are now considering, the general basis or background for tragic action is supplied, as was also the case in the Epos, by that world-condition which I have already indicated as the *heroic*. For only in heroic times, when the universal ethical forces have neither acquired the independent stability of definite political legislation or moral commands and obligations, can they be presented in their primitive jucundity as gods, who are either opposed to each other in their personal activities, or themselves appear as the animated content of a free and human individuality. If, however, what is intrinsically ethical is to appear throughout as the substantive foundation, the universal ground, shall we say, from which the growth of personal action arrests our attention with equal force in its disunion, and is no less brought back again from such divided movement into unity, we shall find that there are two distinct modes under which the ethical content of human action is asserted.

First we have the simple consciousness, which, in so far as it wills its substantive content[42] wholly as the unbroken identity of its particular aspects, remains in undisturbed, uncriticized, and neutral tranquillity on its own account and as related to others. This undivided and, we may add, purely formal[43] state of mind in its veneration, its faith, and its happiness, however, is incapable of attaching itself to any definite action; it has a sort of dread before the disunion which is implied in such, although it does, while remaining itself incapable of action, esteem at the same time that spiritual courage which asserts itself resolutely and actively in a self-proposed object, as of nobler worth, yet is aware of its inability to undertake

such enterprize, and consequently considers that it can do nothing further for such active personalities, whom it respects so highly, than contrast with the energy of their decision and conflict the object of its own wisdom, in other words, the substantive ideality of the ethical Powers.

The *second* mode under which this ethical content is asserted is that of the individual pathos,[44] which urges the active characters to their moral self-vindication into the opposition they occupy relatively to others, and brings them thereby into conflict. The individuals subject to this pathos are neither what, in the modern use of the term, we describe as characters, nor are they mere abstractions. They are rather placed in the vital midway sphere between both, standing there as figures of real stability, which are simply that which they are, without aught of collision in themselves, without any fluctuating recognition of some other pathos, and in so far — in this respect a contrast to our modern irony — elevated, absolutely determinate characters, whose definition, however, discovers its content and basis in a particular ethical power. Forasmuch as, then, the tragic situation first appears in the *antagonism* of individuals who are thus empowered to act, the same can only assert itself in the field of actual human life. It results from the specific character of this alone that a particular quality so affects the substantive content of a given individual, that the latter identifies himself with his entire interest and being in such a content, and penetrates it throughout with the glow of passion. In the blessed gods, however, it is the divine Nature, in its indifference, which is what is essential; in contrast to which we have the contradiction, which in the last instance is not treated seriously, rather is one which, as I have already noticed when discussing the Homeric Epos, becomes eventually a self-resolving irony. These two modes or aspects — of which the one is as important for the whole as the other — namely, the unsevered consciousness of the godlike, and the combating human action, asserted, however, in godlike power and deed, which

determines and executes the ethical purpose — supply the two fundamental elements, the mediation of which is displayed by Greek tragedy in its artistic compositions under the form of *chorus* and *heroic figures* respectively.

In modern times, considerable discussion has been raised over the significance of the Greek chorus, and the question has been raised incidentally whether it can or ought to be introduced into modern tragedy. In fact, the need of some such substantial foundation has been experienced; but critics have found it difficult to prescribe the precise manner in which effect should be given to such a change, because they failed to grasp with sufficient penetration the nature of that in which true tragedy consists and the necessity of the chorus as an essential constituent of all that Greek tragedy implies. Critics have, no doubt, recognized the nature of the chorus to the extent of maintaining that in it we find an attitude of tranquil meditation over the whole, whereas the characters of the action remain within the limits of their particular objects and situations, and, in short, receive in the chorus and its observations a standard of valuation of their characters and actions in much the same way as the public discovers in it, and within the drama itself, an objective representative of its own judgment upon all that is thus represented. In this view we have to this extent the fact rightly conceived, that the chorus is, in truth, there as a substantive and more enlightened intelligence, which warns us from irrelevant oppositions, and reflects upon the genuine issue. But, granting this to be so, it is by no means a wholly disinterested person, at leisure to entertain such thoughts and ethical judgments as it likes as are the spectators, which, uninteresting and tedious on its own account, could only be attached for the sake of such reflections. The chorus is the actual substance of the heroic life and action itself: it is, as contrasted with the particular heroes, the common folk regarded as the fruitful heritage, out of which individuals, much as flowers

and towering trees from their native soil, grow and whereby they are conditioned in this life. Consequently, the chorus is peculiarly fitted to a view of life in which the obligations of State legislation and settled religious dogmas do not, as yet, act as a restrictive force in ethical and social development, but where morality only exists in its primitive form of directly animated human life, and it is merely the equilibrium of unmoved life which remains assured in its stability against the fearful collisions which the antagonistic energies of individual action produces. We are made aware of the fact that an assured asylum of this kind is also a part of our actual existence by the presence of the chorus. It does not, therefore, practically co-operate with the action; it executes by its action no right as against the contending heroes; it merely expresses its judgment as a matter of opinion; it warns, commiserates, or appeals to the divine law, and the ideal forces imminent in the soul, which the imagination grasps in external guise as the sphere of the gods that rule. In this self-expression it is, as we have already seen, lyrical; for it does not act and there are no events for it to narrate in epical form. The content, however, retains at the same time the epic character of substantive universality; and its lyric movement is of such a nature that it can, and in this respect in contrast to the form of the genuine ode, approach at times that of the paean and the dithyramb. We must lay emphatic stress upon this position of the chorus in Greek tragedy. Just as the theatre itself possesses its external ground, its scene and environment, so, too, the chorus, that is the general community, is the spiritual scene; and we may compare it to the architectural temple which surrounds the image of the god, which resembles the heroes in the action. Among ourselves, statues are placed under the open sky without such a background, which also modern tragedy does not require, for the reason that its actions do not depend on this substantive basis, but on the personal volition and personality, no less than the apparently external contingency of events and circumstances.

In this respect it is an entirely false view which regards the chorus as an accidental piece of residuary baggage, a mere remnant from the origins of Greek drama. Of course, it is incontestable that its source is to be traced to the circumstance that, in the festivals of Bacchus, so far as the artistic aspect is concerned, the choral song was of most importance until the introduction and interruption of its course by one reciter, whose relation finally was transformed into and exalted by the real figures of dramatic action. In the blossoming season of tragedy, however, the chorus was not by any means merely retained in honour of this particular phase of the festival and ritual of the god Bacchus; rather it became continuously more elaborate in its beauty and harmonious measures by reason of the fact that its association with the dramatic action is essential and, indeed, so indispensable to it that the decline of tragedy is intimately connected with the degeneration of the choruses, which no longer remain an integral member of the whole, but are degraded to a mere embellishment. In contrast to this, in romantic tragedy, the chorus is neither intrinsically appropriate nor does it appear to have originated from choric songs. On the contrary, the content is here of a type which defeats from the first any attempt to introduce choruses as understood by Greek dramatists. For, even if we go back to the most primitive of those so-called mysteries, morality plays and farces of a similar character, from which the romantic drama issued, we find that these present no action in that original Greek sense of the term, no outbreak, that is, of opposing forces from the undivided consciousness of life and the god-like. To as little extent is the chorus adapted to the conditions of chivalry and the dominion of kings, in so far as, in such cases, the attitude of the folk is one of mere obedience, or it is itself a party, involved together with the interest of its fortune or misfortune in the course of the action. And in general the chorus entirely fails to secure its true

position where the main subject-matter consists of particular passions, ends, and characters, or any considerable opportunity is admitted to intrigue.

In contrast to the chorus, the *second* fundamental feature of dramatic composition is that of the *individuals* who act in *conflict* with each other. In Greek tragedy it is not at all the bad will, crime, worthlessness, or mere misfortune, stupidity, and the like, which act as an incentive to such collisions, but rather, as I have frequently urged, the ethical right to a definite course of action.[45] Abstract evil neither possesses truth in itself, nor does it arouse interest. At the same time, when we attribute ethical traits of characterization to the individuals of the action, these ought not to appear merely as a matter of opinion. It is rather implied in their right or claim that they are actually there as essential on their own account. The hazards of crime, such as are present in modern drama — the useless, or quite as much the so-called noble criminal, with his empty talk about fate, we meet with in the tragedy of ancient literature, rarely, if at all, and for the good reason that the decision and deed depends on the wholly personal aspect of interest and character, upon lust for power, love, honour, or other similar passions, whose justification has its roots exclusively in the particular inclination and individuality. A resolve of this character, whose claim is based upon the content of its object, which it carries into execution in one restricted direction of particularization, violates, under certain circumstances, which are already essentially implied in the actual possibility of conflicts, a further and equally ethical sphere of human volition, which the character thus confronted adheres to, and, by his thus stimulated action, enforces, so that in this way the collision of powers and individuals equally entitled to the ethical claim is completely set up in its movement.

The sphere of this content,[46] although capable of great variety of detail, is not in its essential features very extensive. The principal source of opposition, which Sophocles in particular, in this respect following the lead

of Æschylus, has accepted and worked out in the finest way, is that of the *body politic*, the opposition, that is, between ethical life in its social universality and the family as the natural ground of moral relations. These are the purest forces of tragic representation. It is, in short, the harmony of these spheres and the concordant action within the bounds of their realized content, which constitute the perfected reality of the moral life. In this respect I need only recall to recollection the "Seven before Thebes" of Æschylus and, as a yet stronger illustration, the "Antigone" of Sophocles. Antigone reverences the ties of blood-relationship, the gods of the nether world. Creon alone recognizes Zeus, the paramount Power of public life and the commonwealth. We come across a similar conflict in the "Iphigeneia in Aulis," as also in the "Agamemnon," the "Choephorae," and "Eumenides" of Æschylus, and in the "Electra" of Sophocles. Agamemnon, as king and leader of his army, sacrifices his daughter in the interest of the Greek folk and the Trojan expedition. He shatters thereby the bond of love as between himself and his daughter and wife, which Clytemnestra retains in the depths of a mother's heart, and in revenge prepares an ignominious death for her husband on his return. Orestes, their son, respects his mother, but is bound to represent the right of his father, the king, and strikes dead the mother who bore him.

A content of this type retains its force through all times, and its presentation, despite all difference of nationality, vitally arrests our human and artistic sympathies.

Of a more formal type is that second kind of essential collision, an illustration of which in the tragic story of Œdipus the Greek tragedians especially favoured. Of this Sophocles has left us the most complete example in his "Œdipus Rex," and "Œdipus in Colonos." The problem here is concerned with the claim of alertness in our intelligence, with the nature of the obligation[47] implied in that which a man carries out with a volition

fully aware of its acts as contrasted with that which he has done in fact, but unconscious of and with no intention of doing what he has done under the directing providence of the gods. Œdipus slays his father, marries his mother, begets children in this incestuous alliance, and nevertheless is involved in these most terrible of crimes without active participation either in will or knowledge. The point of view of our profounder modern consciousness of right and wrong would be to recognize that crimes of this description, inasmuch as they were neither referable to a personal knowledge or volition, were not deeds for which the true personality of the perpetrator was responsible. The plastic nature of the Greek on the contrary adheres to the bare fact which an individual has achieved, and refuses to face the division implied by the purely ideal attitude of the soul in the self-conscious life on the one hand and the objective significance of the fact accomplished on the other.

For ourselves, to conclude this survey, other collisions, which either in general are related to the universally accepted association of personal action to the Greek conception of Destiny, or in some measure to more exceptional conditions, are comparatively speaking less important.

In all these tragic conflicts, however, we must above all place on one side the false notion of *guilt* or *innocence*. The heroes of tragedy are quite as much under one category as the other. If we accept the idea as valid that a man is guilty only in the case that a choice lay open to him, and he deliberately decided on the course of action which he carried out, then these plastic figures of ancient drama are guiltless. They act in accordance with a specific character, a specific pathos, for the simple reason that they are this character, this pathos. In such a case there is no lack of decision and no choice. The strength of great characters consists precisely in this that they do not choose, but are entirely and absolutely just that which they will and achieve. They are simply themselves, and never anything else, and their

greatness consists in that fact. Weakness in action, in other words, wholly consists in the division of the personal self as such from its content, so that character, volition and final purpose do not appear as absolutely one unified growth; and inasmuch as no assured end lives in the soul as the very substance of the particular personality, as the pathos and might of the individual's entire will, he is still able to turn with indecision from this course to that, and his final decision is that of caprice. A wavering attitude of this description is alien to these plastic creations. The bond between the psychological state of mind and the content of the will is for them indissoluble. That which stirs them to action is just in this very pathos which implies an ethical justification and which, even in the pathetic aspects of the dialogue, is not enforced in and through the merely personal rhetoric of the heart and the sophistry of passion, but in the equally masculine and cultivated objective presence, in the profound possibilities, the harmony and vitally plastic beauty of which Sophocles was to a superlative degree master. At the same time, however, such a pathos, with its potential resources of collision, brings in its train deeds that are both injurious and wrongful. They have no desire to avoid the blame that results therefrom. On the contrary, it is their fame to have done what they have done. One can in fact urge nothing more intolerable against a hero of this type than by saying that he has acted innocently. It is a point of honour with such great characters that they are guilty. They have no desire to excite pity or our sensibilities. For it is not the substantive, but rather the wholly personal deepening[48] of the individual character, which stirs our individual pain. These securely strong characters, however, coalesce entirely with their essential pathos, and this indivisible accord inspires wonder, but does not excite heart emotions. The drama of Euripides marks the transition to that.

The final result, then, of the development of tragedy conducts us to this issue and only this, namely, that the twofold vindication of the mutually

conflicting aspects are no doubt retained, but the *onesided* mode under which they were maintained is cancelled, and the undisturbed ideal harmony brings back again that condition of the chorus, which attributes without reserve equal honour to all the gods. The true course of dramatic development consists in the annulment of *contradictions* viewed as such, in the reconciliation of the forces of human action, which alternately strive to negate each other in their conflict. Only so far is misfortune and suffering not the final issue, but rather the satisfaction of spirit, as for the first time, in virtue of such a conclusion, the necessity of all that particular individuals experience, is able to appear in complete accord with reason, and our emotional attitude is tranquillized on a true ethical basis, rudely shaken by the calamitous result to the heroes, but reconciled in the substantial facts. And it is only in so far as we retain such a view securely that we shall be in a position to understand ancient tragedy. We have to guard ourselves therefore from concluding that a *dénouement* of this type is merely a moral issue conformably to which evil is punished and virtue rewarded, as indicated by the proverb that “when crime turns to vomit, virtue sits down at table.” We have nothing to do here with this wholly personal aspect of a self-reflecting personality and its conception of good and evil, but are concerned with the appearance of the affirmative reconciliation and with the equal validity of both the powers engaged in actual conflict, when the collision actually took place. To as little extent is the necessity of the issue a blind destiny, or in other words a purely irrational, unintelligible fate, identified with the classical world by many; rather it is the rationality of destiny, albeit it does not as yet appear as self-conscious Providence, the divine final end of which in conjunction with the world and individuals appears on its own account and for others, depending as it does on just this fact that the highest Power paramount over particular gods and mankind cannot suffer this, namely, that the forces, which affirm their selfsubsistence

in modes that are abstract or incomplete, and thereby overstep the boundary of their warrant, no less than the conflicts which result from them, should retain their self-stability. Fate drives personality back upon its limits, and shatters it, when it has grown overweening. An irrational compulsion, however, an innocence of suffering would rather only excite indignation in the soul of the spectator than ethical tranquillity. From a further point of view, therefore, the reconciliation of *tragedy* is equally distinct from that of the *Epos*. If we look at either Achilles or Odysseus in this respect we observe that both attain their object, and it is right that they do so; but it is not a continuous happiness with which they are favoured; they have on the contrary to taste in its bitterness the feeling of finite condition, and are forced to fight wearily through difficulties, losses and sacrifices. It is in fact a universal demand of truth that in the course of life and all that takes place in the objective world the nugatory character of finite conditions should compel attention. So no doubt the anger of Achilles is reconciled; he obtains from Agamemnon that in respect of which he had suffered the sense of insult; he is revenged upon Hector; the funeral rites of Patroclus are consummated, and the character of Achilles is acknowledged in all its glory. But his wrath and its reconciliation have for all that cost him his dearest friend, the noble Patroclus; and, in order to avenge himself upon Hector for this loss, he finds himself compelled to disengage himself from his anger, to enter once more the battle against the Trojans, and in the very moment when his glory is acknowledged receives the prevision of his early death. In a similar way Odysseus reaches Ithaca at last, the goal of his desire; but he does so alone and in his sleep, having lost all his companions, all the war-booty from Ilium, after long years of endurance and fatigue. In this way both heroes have paid their toll to finite conditions and the claim of nemesis is evidenced in the destruction of Troy and the misfortunes of the Greek heroes. But this nemesis is simply justice as conceived of old, which merely

humiliates what is everywhere too exalted, in order to establish once more the abstract balance of fortune by the instrumentality of misfortune, and which merely touches and affects finite existence without further ethical signification. And this is the justice of the Epic in the field of objective fact, the universal reconciliation of what is simply accommodation.[49] The higher conception of reconciliation in tragedy is on the contrary related to the resolution of specific ethical and substantive facts from their contradiction into their true harmony. The way in which such an accord is established is asserted under very different modes; I propose therefore merely to direct attention to the fundamental features of the actual process herein involved.

Firsts we have particularly to emphasize the fact, that if it is the onesidedness of the pathos which constitutes the real basis of collisions this merely amounts to the statement that it is asserted in the action of life, and therewith has become the unique pathos of a particular individual. If this one-sidedness is to be abrogated then it is this individual which, to the extent that his action is exclusively identified with this isolated pathos, must perforce be stripped and sacrificed. For the individual here is merely this single life, and, if this unity is not secured in its stability on its own account, the individual is shattered.

The most complete form of this development is possible when the individuals engaged in conflict relatively to their concrete or objective life appear in each case essentially involved in one whole, so that they stand fundamentally under the power of that against which they battle, and consequently infringe that, which, conformably to their own essential life, they ought to respect. Antigone, for example, lives under the political authority of Creon; she is herself the daughter of a king and the affianced of Haemon, so that her obedience to the royal prerogative is an obligation. But Creon also, who is on his part father and husband, is under obligation to respect the sacred ties of relationship, and only by breach of this can give an

order that is in conflict with such a sense. In consequence of this we find immanent in the life of both that which each respectively combats, and they are seized and broken by that very bond which is rooted in the compass of their own social existence. Antigone is put to death before she can enjoy what she looks forward to as bride, and Creon too is punished in the fatal end of his son and wife, who commit suicide, the former on account of Antigone's death, and the latter owing to Haemon's. Among all the fine creations of the ancient and the modern world — and I am acquainted with pretty nearly everything in such a class, and one ought to know it, and it is quite possible — the "Antigone" of Sophocles is from this point of view in my judgment the most excellent and satisfying work of art.

The tragic issue does not, however, require in every case as a means of removing both over-emphasized aspects and the equal honour which they respectively claim the downfall of the contestant parties. The "Eumenides" does not end, as we all know, with the death of Orestes, or the destruction of the Eumenides, these avenging spirits of matricide and filial affection, these opponents of Apollo, who seeks to protect unimpaired the worth of and reverence for the family chief and king, the god who had prompted Orestes to slay Clytaemnestra, but will have Orestes released from the punishment and honour bestowed on both himself and the Furies. At the same time we cannot fail to see in this adjusted conclusion the nature of the authority which the Greeks attached to their gods when they presented them as mere individuals contending with each other. They appear, in short, to the Athenian of everyday life merely as definite aspects of ethical experience which the principles of morality viewed in their complete and harmonious coherence bind together. The votes of the Areopagus are equal on either side. It is Athene, the goddess, the life of Athens, that is, imagined in its essential unity, who adds the white pebble, who frees Orestes, and at the

same time promises altars and a cult to the Eumenides no less than Apollo. As a contrast to this type of objective reconciliation the settlement may be, *secondly*, of a more personal character. In other words, the individual concerned in the action may in the last instance surrender his onesided point of view. In this betrayal by personality of its essential pathos, however, it cannot fail to appear destitute of character; and this contradicts the masculine integrity of such plastic figures. The individual, therefore, can only submit to a higher Power and its counsel or command, to the effect that while on his own account he adheres to such a pathos, the will is nevertheless broken in its bare obstinacy by a god's authority. In such a case the knot is not loosened, but, as in the case of Philoctetes, it is severed by a *deus ex machinâ.*

But as a *further* and final class, and one more beautiful than the above rather external mode of resolution we have the reconciliation more properly of the soul itself, in which respect there is, in virtue of the personal significance, a real approach to our modern point of view. The most perfect example of this in ancient drama is to be found in the ever admirable "Œdipus Coloneus" of Sophocles. The protagonist here has unwittingly slain his father, secured the sceptre of Thebes, and the bridal bed of his own mother. He is not rendered unhappy by these unwitting crimes; but the power of divination he has of old possessed makes him realize, despite himself, the darkness of the experience that confronts him, and he becomes fearfully, if indistinctly, aware of what his position is.[50] In this resolution of the riddle in himself he resembles Adam, losing his happiness when he obtains the knowledge of good and evil. What he then does, the seer, is to blind himself, then abdicate the throne and depart from Thebes, very much as Adam and Eve are driven from Paradise. From henceforward he wanders about a helpless old man. Finally a god calls the terribly afflicted man to himself,[51] the man, that is, who refusing the request of his sons that he

should return to Thebes, prefers to associate with the Erinnys; the man, in short, who extinguishes all the disruption in himself and who purifies himself in his own soul. His blind eyes are made clear and bright, his limbs are healed, and become a treasure of the city which received him as a free guest. And this illumination in death is for ourselves no less than for him the more truly visible reconciliation which is worked out both in and for himself as individual man, in and through, that is, his essential character. Critics have endeavoured to discover here the temper of the Christian life; we are told we have here the picture of a sinner, whom God receives into His grace; and the fateful misfortunes which expire in their finite condition, are made good with the seal of blessedness in death. The reconciliation of the Christian religion, however, is an illumination of the soul, which, bathed in the everlasting waters of salvation, is raised above mortal life and its deeds. Here it is the heart itself, for in such a view the spiritual life can effect this, which buries that life and its deed in the grave of the heart itself, counting the recriminations of earthly guilt as part and parcel of its own earthly individuality; and which, in the full assuredness of the eternally pure and spiritual condition of blessedness, holds itself in itself calm and steadfast against such impeachment. The illumination of Œdipus, on the contrary, remains throughout, in consonance with ancient ideas, the restoration of conscious life from the strife of ethical powers and violations to the renewed and harmonious unity of this *ethical content itself*.[52]

There is a further feature in this type of reconciliation, however, and that is the *personal* or ideal nature of the satisfaction. We may take this as a point of transition to the otherwise to be contrasted province of *comedy*.

(*ββ*) That which is comic is, as we have already seen, in general terms the subjective or personal state, which forces and then dissolves the action which issues from it by its own effect into and in contradiction, remaining throughout and in virtue of this process tranquil in its own self-assurance.

Comedy possesses, therefore, for its basis and point of departure that with which it is possible for tragedy to terminate, that is, a soul to the fullest extent and eventually reconciled, a joyous state, which, however much it is instrumental in the marring of its volitional power, and, indeed, in itself comes to grief, by reason of its asserting voluntarily what is in conflict with its aim, does not therefore lose its general equanimity. A personal self-assurance of this character, however is, from a further point of view, only possible in so far as the ends proposed, and withal the characters include nothing that is on its own account essentially substantive; or, if they do possess such an intrinsic worth, it is adopted and carried out intentionally under a mode which is totally opposed to the genuine truth contained, in a form, therefore, that is destitute of such truth, so that in this respect, as in the previous case, it is merely that which is itself essentially of no intrinsic importance, but a matter of indifference which is marred, and the individual remains just as he was and unaffected.

Such a view is, too, in its general lines the conception of the old classic comedy, in so far as tradition reflects it in the plays of Aristophanes. We should, however, be careful to notice the distinction whether the individuals in the play are aware that they are comic, or are so merely from the spectator's point of view. It is only the first class that we can reckon as part of the genuine comedy in which Aristophanes was a master. Conformably to such a type a character is only placed in a ridiculous situation, when we perceive that he himself is not serious in what is actually of such a quality in his purpose and voluntary effort, so that this constituent of either is throughout the means of his own undoing, inasmuch as throughout such a character is unable to enter into any more noble and universally valid interest, which necessarily involves it in a situation of conflict;[53] and, even assuming that he does actually partake of it, merely does so in a way that shows a nature, which, in virtue of its practical existence, has already

annihilated that which it appears to strive to bring into operation, so that after all one sees such a coalescence has never been really effected. The comic comes, therefore, rather into play among classes of a lower social order in actual conditions of life, among men who remain much as they are, and neither are able or desire to be anything else; who, while incapable of any genuine pathos, have no doubt whatever as to what they are and do. At the same time the higher nature that is in them is asserted in this that they are not with any seriousness attached to the finite conditions which hem them in, but remain superior to the same and in themselves essentially steadfast and self-reliant against mishap and loss. This absolute freedom of spirit, which brings its own essential comfort from the first in all that a man undertakes, this world of the blitheness of human soul-life is that to which Aristophanes conducts us. Without a reading of him it is hardly possible to imagine what a wealth of exuberance there is in the human heart.

The interests among which this type of comedy moves are not necessarily taken from the opposed spheres of religion, morality, and art. On the contrary the old Greek comedy remains no doubt within the limits of this positive and substantive content of human life; but it is the individual caprice, the vulgar folly and perversity, by reason of which the characters concerned bring to nought activities which in their aim have a finer significance. And in this respect an ample and very pertinent material is supplied Aristophanes partly by Greek gods, and partly by the life of the Athenian people. In other words, the configuration of the divine in human impersonation itself possesses, in its mode of presentation and its particularization, to the extent at least that it is further enforced in opposition to that which is merely one-sided and human, the contradiction that is opposed to the nobility of its significance; it is thus permitted to appear as a purely empty extension of this personal life which is inadequate wholly to express it. More particularly, however, Aristophanes revels in the

follies of the common folk, the stupidities of its orators and statesmen, the blockheadedness of war, and is eager, above all, and with all the politeness of his satire and the full weight of his ridicule, but also not without the profoundest meaning, to hand over the new tendencies of the tragedies of Euripides to the laughter of his fellow-citizens. The characters he has imported into the substance of his amazing artistic creations he runs into the mould of fool from the start with a sportive fancy that seems inexhaustible, so that the very idea of a rational result is impossible. He treats all alike, whether it be a Strepsiades, who will join the ranks of philosophers in order to be rid of his debts, or a Socrates, who offers to instruct the aforesaid Strepsiades and his son, or Bacchus, whom he makes descend into the lower world, in order to bring up a genuine tragic poet, and in just the same way Cleon, the women and the Greeks, who would like to pump up the goddess of Peace from the well. The key-note that we find in all these various creations is the imperturbable self-assurance of such characters one and all, which becomes all the more emphatic in proportion as they prove themselves incapable of carrying into effect that which they project. Our fools here are so entirely unembarrassed in their folly, and also the more sensible among them possess such a tincture of that which runs contrary to the very course upon which they are set, that they all, the more sensible with the rest, remain fixed to this personal attitude of prodigious imperturbility, no matter what comes next or where it carries them. It is in fact the blessed laughter of the Olympian gods, with their untroubled equanimity, now at home in the human breast, and prepared for all contingences. And withal we never find Aristophanes merely a cold or evil-disposed mocker. He was a man of the finest education, a most exemplary citizen, to whom the weal of Athens was of really deep importance, and who through thick and thin shows himself to be a true patriot. What therefore is in the fullest sense resolved in his comedies is, as already

stated, not the divine and what is of ethical import, but the thoroughgoing upside-down-ness which inflates itself into the semblance of these substantive forces, the particular form and distinctive mode of its manifestation, in which the essential thing or matter is already from the first no longer present, so that it can without restriction be simply handed over to the unconcerned play of unqualified personal caprice. But for the very reason that Aristophanes makes explicit the absolute contradiction between the essential nature of the gods, or that of political and social life, and the personal activities of individual persons or citizens, who ought to endow such substantive form with reality, we find in this very triumph of purely personal self-assertion, despite all the profounder insight which the poet displays, one of the greatest symptoms of the degeneracy of Greece. And it is on account of this that these pictures of a wholly unperturbed sense of "everything coming out right in the end" [54] are as a matter of fact the last important harvest which we have from the poetry created by the exuberant genius, culture, and wit of the Greek nation.

(*β*) I shall now direct attention to the dramatic art of the modern world, and here, too, I only propose to emphasize the more general and fundamental features which we find of importance, whether dealing with tragedy or the ordinary drama and comedy.

(*αα*) Tragedy, in the nobility which distinguishes it in its ancient plastic form, is limited to the partial point of view that for its exclusive and essential basis it only enforces as effective the ethically substantive content and its necessary laws; and, on the other hand, leaves the individual and subjective self-penetration of the dramatic characters essentially unevolved; while comedy on its part, to complete what we may regard as the reversed side of such plastic construction, exhibits to us the personal caprice of soul-life in the unfettered abandonment of its topsy-turvydom and ultimate dissolution.

Modern tragedy accepts in its own province from the first the principle of subjectivity or self-assertion. It makes, therefore, the personal intimacy of character — the character, that is, which is no purely individual and vital embodiment of ethical forces in the classic sense — its peculiar object and content. It, moreover, makes, in a type of concurrence that is adapted to this end, human actions come into collision through the instrumentality of the external accident of circumstances in the way that a contingency of a similar character is also decisive in its effect on the consequence, or appears to be so decisive.

In this connection we would subject to examination the following fundamental points:

Firsts the nature of the varied *ends* which ought to come into the executive process of the action as the content of the characters therein.

Secondly, the nature of the tragic *characters* themselves, as also of the collisions they are compelled to face.

Thirdly, the nature of the final *issue* and tragic reconciliation, as these differ from those of ancient tragedy.

To start with, we may observe that, however much in romantic tragedy the personal aspect of suffering and passions, in the true meaning of such an attitude, is the focal centre, yet, for all that, it is impossible in human activity that the ground basis of definite ends borrowed from the concrete worlds of the family, the State, the Church, and others should be dispensed with. In so far, however, as in the drama under discussion, it is not the substantive content as such in these spheres of life which constitutes the main interest of individuals. Such ends are from a certain point of view particularized in a breadth of extension and variety, as also in exceptional modes of presentment, in which it often happens that what is truly essential is only able to force itself on our attention with attenuated strength. And

over and above this fact, these ends receive an entirely altered form. In the province of religion, for example, the content which pre-eminently is asserted is no longer the particular ethical powers exhibited imaginatively under the mode of divine individuals, either in their own person or in the pathos of human heroes. It is the history of Christ, or of saints and the like, which is now set before us. In the political community it is mainly the position of kingship, the power of vassal chiefs, the strife of dynasties, or the particular members of one and the same ruling family which forms the content of the varied picture. Nay, if we take a step further we find as the principal subject-matter questions of civic or private right and other relations of a similar character; and, further, we shall find a similar attention paid to features in the family life which were not yet within the reach of ancient drama. And the reason of this is that, inasmuch as in the spheres of life above-mentioned the principle of the personal life in its independence has asserted its claim, novel phases of existence make their inevitable appearance in each one of them, which the modern man claims to set up as the end and directory of his action.

And, from a further point of view in this drama, it is the right of subjectivity, as above defined, absolutely unqualified, which is retained as the dominating content; and for this reason personal love, honour, and the rest make such an exclusive appeal as ends of human action that, while in one direction other relations cannot fail to appear as the purely external background on which these interests of our modern life are set in motion, in another such relations on their own account actively conflict with the requirements of the more individual state of emotion. Of more profound significance still is wrong and crime, even assuming that a particular character does not deliberately and to start with place himself in either, yet does not avoid in order to attain his original purpose.

And, furthermore, in contrast to this particularization and individual standpoint, the ends proposed may likewise either in one direction expand to cover the universality and all-inclusive embrace of the content, or they are in another apprehended and carried into execution as themselves intrinsically substantive. In the first respect, I will merely recall to memory that typically philosophical tragedy, the "Faust" of Goethe, in which, on the one hand, a spirit of disillusion in the pursuit of science, and, on the other, the vital resources of a worldly life and earthly enjoyment — in a word, the attempted mediation in the tragic manner of an individual's wisdom and strife with the Absolute in its essential significance and phenomenal manifestation, offers a breadth of content such as no other dramatic poet has hitherto ventured to include in one and the same composition. The "Carl Moor" of Schiller is something of the same fashion. He rebels against the entire order of civic society and the collective condition of the world and the humanity of his time, and fortifies himself as such against the same. Wallenstein in the same way conceives a great and far-reaching purpose, the unity and peace of Germany, an object he fails to carry into effect by the means which, in virtue of the fact that they are wielded together in an artificial manner, and one that lacks essential coherence, break in pieces and come to nought precisely in the direction where he is most anxious of their success; and he fails in the same way by reason of his opposition to the imperial authority, upon which he himself and his enterprise are inevitably shattered. Such objects of a world-wide policy, such as a Carl Moor or a Wallenstein pursue, are as a rule not accomplished at the hands of a single individual by the simple means that other men are induced to obey and co-operate; they are carried into effect by the commanding personality, partly acting in conjunction with the wills of many others, and in part in opposition to, or at least on lines of which they have no knowledge. As an illustration of a conception of objects viewed in their essential significance,

I will merely instance certain tragedies of Calderon, in which love, honour, and similar virtues are respectively to the rights and obligations in which they involve the characters of the action, treated as so many unyielding laws of independent force with all the stringency of a code. We find also frequently much the same thing assumed in Schiller's tragic characters, though the point of view is no doubt wholly different, at least to the extent that such individuals conceive and combat for their ends with the assumption they are universal and absolutely valid human rights. So in the early play of "Kabale und Liebe" Major Ferdinand seeks to defend the rights of Nature against the conveniences of fashionable society, and, above all, claims of the Marquis Posa freedom of thought as an inalienable possession of humanity.

Generally speaking, however, in modern tragedy it is not the substantive content of its object in the interest of which men act, and which is maintained as the stimulus of their passion; rather it is the inner experience of their heart and individual emotion, or the particular qualities of their personality, which insist on satisfaction. For even in the examples already referred to we find that to a real extent in those heroes of Spanish honour and love the content of their ultimate ends is so essentially of a personal character that the rights and obligations deducible from the same are able to fuse in direct concurrence with the individual desires of the heart, and to a large extent, too, in the youthful works of Schiller this continual insistence upon Nature, rights of man, and a converted world somewhat savours of the excess of a wholly personal enthusiasm. And if it came about that Schiller in later years endeavoured to enforce a more mature type of pathos, this was simply due to the fact that it was his main idea to restore once again in modern dramatic art the principle of ancient tragedy.

In order to emphasize still more distinctly the difference which in this respect obtains between ancient and modern tragedy, I will merely refer the

reader to Shakespeare's "Hamlet." Here we find fundamentally a collision similar to that which is introduced by Æschylus into his "Choeporae" and that by Sophocles into his "Electra." For Hamlet's father, too, and the King, as in these Greek plays, has been murdered, and his mother has wedded the murderer. That which, however, in the conception of the Greek dramatists possesses a certain ethical justification — I mean the death of Agamemnon — relatively to his sacrifice of Iphigeneia in the contrasted case of Shakespeare's play, can only be viewed as an atrocious crime, of which Hamlet's mother is innocent; so that the son is merely concerned in his vengeance to direct his attention to the fratricidal king, and there is nothing in the latter's character that possesses any real claim to his respect. The real collision, therefore, does not turn on the fact that the son, in giving effect to a rightful sense of vengeance, is himself forced to violate morality, but rather on the particular personality, the inner life of Hamlet, whose noble soul is not steeled to this kind of energetic activity, but, while full of contempt for the world and life, what between making up his mind and attempting to carry into effect or preparing to carry into effect its resolves, is bandied from pillar to post, and finally through his own procrastination and the external course of events meets his own doom.

If we now turn, in close connection with the above conclusions, to our *second* point of fundamental importance in modern tragedy — that is to say, the nature of the characters and their collisions — we may summarily take a point of departure from the following general observations.

The heroes of ancient classic tragedy discover circumstances under which they, so long as they irrefragably adhere to the *one* ethical state of pathos which alone corresponds to their own already formed personality, must infallibly come into conflict with an ethical Power which opposes them and possesses an equal ethical claim to recognition. Romantic characters, on the contrary, are from the first placed within a wide expanse

of contingent relations and conditions, within which every sort of action is possible; so that the conflict, to which no doubt the external conditions presupposed supply the occasion, essentially abides within the *character* itself, to which the individuals concerned in their passion give effect, not, however, in the interests of the ethical vindication of the truly substantive claims, but for the simple reason that they are the kind of men they are. Greek heroes also no doubt act in accordance with their particular individuality; but this individuality, as before noted, if we take for our examples the supreme results of ancient tragedy, is itself necessarily identical with an ethical pathos which is substantive. In modern tragedy the peculiar character in its real significance, and to which it as a matter of accident remains constant, whether it happens to grasp after that which on its own account is on moral grounds justifiable, or is carried into wrong and crime, forms its resolves under the dictate of personal wishes and necessities, or among other things purely external considerations. In such a case, therefore, though we may have a coalescence between the moral aspect of the object and the character, yet, for all that, such a concurrence does not constitute, and cannot constitute — owing to the divided character of ends, passions, and the life wholly personal to the individual, the *essential* basis and objective condition of the depth and beauty of the tragic drama.

In view of the great variety of difference which further separates particular characters in this type of poetry, it is impossible to do much in the way of generalization. I will, therefore, restrict myself to a reference to the following fundamental points of view. A primary opposition which at once invites notice is that of an *abstract*, and consequently formal, characterization in its contrast with the actual individuals whom we are accustomed to meet in the concrete living world. As example of this type, we may with exceptional pertinency cite the tragic characters of the French

and Italians, which, originating in the imitation of ancient drama, to a greater or less degree merely amount to pure personifications of specific passions, such as love, honour, fame, ambition, tyranny, and so forth, and which, while they present the motives of their actions, as also the gradation and quality of their emotions to the best advantage with a lavish display of declamation, and all the arts of rhetoric, none the less by doing so rather resemble the dramatic failures of Seneca than the dramatic masterpieces of the Greeks. Spanish tragedy also receives the stamp of this abstract style of character-drawing. In this case, however, the pathos of love, in its conflict with honour, friendship, royal prerogative, and the rest is itself of so abstract a subjective character that in the case where the intention is to make this equally ideal[55] substantiality stand out as the genuine object of interest, a more complete particularization of characters is hardly feasible. The characters of Spanish drama, however, often possess a certain kind of solidity, and, if I may use the expression, inflexible personality, however wanting in content it may be, a feature that is absent from French work; and at the same time Spanish writers, here also in contrast to the cold simplicity which the movement of French tragedies exhibits even in their tragic composition, know how to make up with the cleverly invented abundance of interesting situations and developments the deficiency referred to in the matter of characterization.

In contrast to both these schools, and in their mastery of the exposition of fully developed human characters and personality, the English are exceptionally distinguished; and among them, and soaring above the rest at an almost unapproachable height, stands Shakespeare. For even in the cases where a purely formal passion, as for instance ambition in Macbeth, or jealousy in Othello, claims as its field the entire pathos[56] of his tragic hero, such an abstraction impairs by no fraction the full breadth of the personality. Despite of this restriction of analysis[57] the characters remain

throughout entire men. In fact, the more Shakespeare on the infinite embrace of his world-stage, proceeds to develop the extreme limits of evil and folly, to that extent, as I have already observed, on these very boundaries — of course, not without real wealth of poetic embellishment — he concentrates these characters in their limitations. While doing so, however, he confers on them intelligence and imagination; and, by means of the image in which they, by virtue of that intelligence, contemplate themselves objectively as a work of art, he makes them free artists of themselves, and is fully able, through the complete virility and truth of his characterization, to awaken our interest in criminals, no less than in the most vulgar and weak-witted lubbers and fools. Of a similar nature is the style of expression he makes his tragic characters adopt. It is at once individual, realistic, emphatically vital, extraordinarily various, and, moreover, where it seems advisable, it can rise to sublimity and is marked by an overwhelming force of utterance. Its ideal intensity and its qualities of invention are displayed in images and simile that flash from each other with lightning rapidity. Its very rhetoric, here the barren child of no school, but the growth of genuine emotion and penetration into human personality, is such that, if we take into account this extraordinary union of the directness of life itself and ideal greatness of soul, we shall find it hard indeed to point to a single other dramatic poet among the moderns whom we are entitled to rank in his company. No doubt Goethe in his youth made a real effort to achieve some approach to a like natural truth and detailed characterization; but in the ideal force and exaltation of passion his rivalry collapses. The style of Schiller, again, has shown an increasing tendency to violent methods, the tempestuous expatiation of which lack the true core of reality for their basis.

Modern characters also differ in the nature of their *constancy* or their spiritual *vacillation* and distraction. We find, no doubt, the weakness of

indecision, the fluctuations of reflection, the weighing of reasons, conformably to which a resolve should be directed, here and there in classic drama, and more particularly in the tragedies of Euripides. But Euripides is a writer whose tendency is already to forsake the wholly plastic completeness of characterization and action and to develop exceptional aspects of personal sensibility. In modern tragedy we meet yet more frequently such vacillating characters, more particularly on the ground that they are essentially under the sway of two opposed passions, which make them fluctuate from one resolve or one kind of deed to another. I have already made some observations on this attitude of vacillation in another context, and will now merely supplement this by stating that, although the tragic action must depend on colliding factors, yet where we find such a division in *one* and the same individual such a concurrence is always attended with precarious consequences. And the reason is that this disruption into interests, which are opposed to each other, is due in part to an obscurity and obtuseness of the intelligence, and in some measure, too, to weakness and immaturity. We come across characters of this type in the creations of Goethe's younger days, notably Weisungen, Fernando in "Stella," and above all Clavigo. They are, as we may say, double men, who are unable to secure a ready, and so stable, individuality. It is wholly another matter when two opposed spheres of life or moral obligation are equally sacred to a character which, on its own account, is not deficient in stability, and such a person is under the necessity of ranking himself on *one* side to the exclusion of the other. In a case of that kind, the vacillation is merely a moment of passage, and does not itself constitute, as it were, the nervous system of the character. Again, of a somewhat similar kind, is the tragic case where the spiritual life is seduced, despite its nobler purpose, into objects of passion which are contradictory[58] to the same, as in the case of Schiller's "Holy Maid," and are then forced to seek a recovery from this

division of the soul in their own intimate or objective life, or pay the penalty. At the same time, this personal tragedy of the distraction of soul-life, when it is made the pivot on which the tragic action revolves,[59] contains, as a rule, what is merely pitiful and painful, or, from another standpoint, exasperating;[60] and the poet will rather do better to avoid it than go out of his way to find it and develop it. The worst case is that, however, where such a vacillation and veering round of character and the entire personality is — the very dialectic of art being thrown awry for this purpose — made the principle of the entire presentation, as though the truth of all importance was to demonstrate that no character is in itself firmly rooted and self-assured. The one-sided ends of specific passions, it is true, ought not to bring about a realization which is secured without a battle; and also, in everyday life, they cannot fail to experience, through the reactionary power of conditions and individuals which oppose them, their finite character and lack of stability. An issue of this kind, however, before the appearance of which we are unable to get the pertinent conclusion, ought not to be introduced as a dialectical piece of wheel adjustment[61] in the personality itself; if it is, the person concerned, viewed as *this* personal state of the soul, is a wholly empty and undefined form, whose collective living growth is found, no less in respect to its objects than in its character, to be wholly wanting in definition. In much the same way the case, also, is otherwise, where the change in the spiritual condition of the entire man itself appears as a direct consequent of just this, its own kind of self-detachment, so that only that is developed and emphasized which essentially and from the first lay secured in the character. As an example, we find in Shakespeare's Lear that the original folly of the old man is intensified to the point of madness much in the same way that Gloster's spiritual blindness is converted into actual physical blindness, in which for the first time his eyes are opened to the true distinction in the love he

entertains for his two sons respectively. It is precisely Shakespeare who, as a contrast to that exposition of vacillating and essentially self-divided characters, supplies us with the finest examples of essentially stable and consequential characters, who go to their doom precisely in virtue of this tenacious hold upon themselves and their ends. Unsupported by the sanction of the moral law, but rather carried onward by the formal necessity of their personality, they suffer themselves to be involved in their acts by the coil of external circumstances, or they plunge blindly therein and maintain themselves there by sheer force of will, even where all that they do is merely done because they are impelled to assert themselves against others, or because they have simply come to the particular point they have reached. The rise of insurgent passion, one essentially consonant with a certain type of character, one which has not as yet fully emerged, but now secures its utmost expansion, this onward movement and process of a great soul, with all the intimate traits of its evolution, this picture of its selfdestructive conflict with circumstances, human and objective conditions and results, is the main content of some of Shakespeare's most interesting tragedies.

The last of the subjects which we have still to discuss as proposed is the nature of the *tragic issue* which characters in our present drama have to confront, as also the type of tragic *reconciliation* compatible with such a standpoint. In ancient tragedy it is the eternal justice which, as the absolute might of destiny, delivers and restores the harmony of substantive being in its ethical character by its opposition to the particular forces which, in their strain to assert an independent subsistence, come into collision, and which, in virtue of the rational ideality implied in its operations, satisfies us even where we see the downfall of particular men. In so far as a justice of the same kind is present in modern tragedy, it is necessarily, in part, more abstract on account of the closer differentiation of ends and characters, and,

in part, of a colder nature and one that is more akin to that of a criminal court, in virtue of the fact that the wrong and crime into which individuals are necessarily carried, in so far as they are intent upon executing their designs, are of a profounder significance. Macbeth, for instance, the elder daughters of Lear and their husbands, the president in "Kabale und Liebe," Richard III, and many similar examples, on account of their atrocious conduct, only deserve the fate they get. This type of *dénouement* usually is presented under the guise that individuals are crushed by an actual force which they have defied in order to carry out their personal aims. Wallenstein, for example, is shattered on the adamantine wall of the imperial power; but the old Piccolomini, who, in order to maintain the lawful régime, betrays a friend and misuses the rights of friendship, is punished through the death and sacrifice of his son. Götz von Berlichingen, too, attacks a dominant and securely founded political order, and goes to ground, as also Weislingen and Adelheid, who range themselves, no doubt, on the side of this organized power, but, through wrongful deed and disloyalty, prepare the way to disaster. And along with this we have the demand emphasized, in virtue of the personal point of view of such characters, that these should of necessity appear themselves to acknowledge the justice of their fate. Such a state of acceptance may either be of a religious nature, in which case the soul becomes conscious of a more exalted and indestructible condition of blessedness with which to confront the collapse of its mundane personality; or it may be of a more formal, albeit more worldly, type, in so far, that is, as the strength and equanimity of the character persists in its course up to the point of overthrow without breaking asunder; and in this way, despite all circumstances and mischances, preserves with unimpaired energy its personal freedom. Or, as a final alternative, where the substance of such acceptance is of more real

value, by the recognition that the lot which the individual receives is the one, however bitter it may be, which his action merits.

From another point of view, however, we may see the tragic issue also merely in the light of the effect of unhappy circumstances and external accidents, which might have brought about, quite as readily, a different result and a happy conclusion. From such a point of view we have merely left us the conception that the modern idea of individuality, with its searching definition of character, circumstances, and developments, is handed over essentially to the contingency of the earthly state, and must carry the fateful issues of such finitude. Pure commiseration of this sort is, however, destitute of meaning; and it is nothing less than a frightful kind of external necessity in the particular case where we see the downfall of essentially noble natures in their conflict thus assumed with the mischance of purely external accidents. Such a course of events can insistently arrest our attention; but in the result it can only be horrible, and the demand is direct and irresistible that the external accidents ought to accord with that which is identical with the spiritual nature of such noble characters. Only as thus regarded can we feel ourselves reconciled with the grievous end of Hamlet and Juliet. From a purely external point of view, the death of Hamlet appears as an accident occasioned by his duel with Laertes and the interchange of the daggers. But in the background of Hamlet's soul, death is already present from the first. The sandbank of finite condition will not content his spirit. As the focus of such mourning and weakness, such melancholy, such a loathing of all the conditions of life, we feel from the first that, hemmed within such an environment of horror, he is a lost man, whom the surfeit of the soul has wellnigh already done to death before death itself approaches him from without. The same thing may be observed in the case of Romeo and Juliet. The ground on which these tender blossoms have been planted is alien to their nature; we have no alternative

left us but to lament the pathetic transiency of such a beautiful love, which, as some tender rose in the vale of this world of accident, is broken by rude storms and tempests, and the frangible reckonings of noble and well-meaning devices. This pitiful state of our emotions is, however, simply a feeling of reconciliation that is painful, a kind of *unhappy blessedness* in misfortune.

(*ββ*) Much as poets present to us the bare downfall of particular people they are also able to treat the similar contingency of the development of events in such a way, that, despite of the fact the circumstances in all other respects would appear to give them little enough support, a happy issue of such conditions and characters is secured, in which they elicit our interest. No doubt the favour of such a destiny of events has at least an equal claim upon us as the disfavour. And so far as the question merely concerns the nature of this difference, I must admit that I prefer a happy conclusion. How could it be otherwise? I can myself discover no better ground for the preference of misfortune, simply on its own account as such, to a happy resolution than that of a certain condition of fine sensibility, which is devoted to pain and suffering, and experiences more interest in their presence than in painless situations such as it meets with every day. If therefore the interests are of such a nature, that it is really not worth the trouble to sacrifice the men or women concerned on their altar, it being possible for them either to surrender their objects, without making such surrender as is equivalent to a surrender of their individuality, or to mutually come to an agreement in respect thereof, there is no reason why the conclusion should be tragic. The tragic aspect of the conflicts and their resolution ought in principle merely to be enforced in the cases where it is actually necessary in order to satisfy the claim of a superior point of view. If this necessity is absent there is no sufficient ground for mere suffering and unhappiness. And it is simply due to this fact that social *plays* and *dramas*

originate which form, as it were, an intermediate link between tragedies and comedies. I have already in a previous passage explained the poetical standpoint of this class of composition. Among us Germans we find it to some extent appropriating what readily moves us in the world of the citizen and family life; in another direction it is preoccupied with chivalry, a movement to which the Götz of Goethe has given a decided stimulus; mainly, however, we may call it the triumph of *ordinary morality*, which in the large majority of cases is the main thing celebrated. The subject-matter of such plays most in vogue are questions of finance or property, differences of status, unfortunate love affairs, examples of spiritual baseness in the more restricted conditions and affairs of life and so on. In one word, what we have here is that which otherwise is already before our eyes, only with this difference, that in such moral dramas, virtue and duty obtain the victory, and crime is shamed and punished, or betakes itself to repentance, so that in a moral conclusion of this kind the reconciliation ought to centre in this, namely, that whatever happens good is the result. Thereby the fundamental interest is concentrated in the personal or spiritual quality of views held and a good or evil heart. The more, however, the abstractly moral state of mind or heart supplies the pivot on which all turns, so much the less can it be the pathos of a particular matter, or an intrinsically essential object, to which the personality in question is attached. And add to this, from a further point of view, so much the less ultimately is the definite character able to maintain itself and persist in such self-assertion. If all is to be finally focussed in the purely moral aspects of the psychological state, or the condition of the heart, from a subjective point of view such as this, with its dominating emphasis on ethical reflection, no standing ground remains for any other definite characteristics, or at least specific ends to be proposed. Let the heart break and change its views. Such seems to be the idea. Pathetic dramas of this type, notably Kotzebue's "Menschenhass und

Reue," and also too many moral offences in the dramas of Iffland, strictly speaking, have therefore an issue which we can neither call good or bad. I mean by this that the main thing is as a rule the question of pardon and the promise of moral improvement, and we are therefore confronted with that possibility of spiritual conversion and surrender of the self. No doubt in this fact we discover the exalted nature and greatness of Spirit. When, however, the jolly dog,[62] as the heroes of Kotzebue are for the most part, and not unfrequently Iffland's too, after being a scamp and a rascal, suddenly promises to turn over a new leaf, it is frankly impossible with a good-for-nothing chap of this sort that his conversion can be otherwise than mere pretence, or of so superficial a character that it merely affects his skin, and merely supplies a momentary conclusion to the course of events that has no substantial basis, but rather, by all ordinary reckoning, will take the knave to disreputable quarters, if we will only acquaint ourselves with his subsequent history.

(*γγ*) As regards our *modern comedy* I must draw particular attention to one point of difference, to which I have already alluded when discussing the old Attic comedy. The point is this — whether the folly and restricted outlook of the characters of the drama merely appears ridiculous to others, or is equally perceived as such by those persons themselves; whether in short the comic characters are an object of laughter only to the audience, or also to such characters. Aristophanes, that creator of genuine comedy, exclusively accepted as the main principle of his plays the latter alternative. Already, however, in Greek comedy of a later date, and subsequently in the hands of Plautus and Terence, the opposite principle came into vogue; and in our modern examples of comedy it has been carried to such a length that we find a large number of comic compositions the inclination of which is more or less the subject-matter which is ridiculous in a purely prosaic sense, or rather we might say matters that leave a sour taste in the mouth of and

are repugnant to the comic characters. This is the standpoint of Molière in particular in his best comedies, which have no right to be regarded as farces. The prosaic quality here is justified on the ground that the objects aimed at by such characters are a matter of bitter earnest. They are deadly serious in the pursuit of it; they are therefore quite unable to join with satisfaction in the laughter, when they are finally deceived, or themselves are responsible for its failure. They are in short merely the disillusioned objects of a laughter foreign to themselves and generally damaging to themselves. As an example: Molière's Tartuffe *le faux dévot*, viewed as the unmasking of a really damned rascal has nothing funny in it, but is a very earnest business, and the deception of the deluded Orgon amounts to a sheer intensity of misfortune, which can only be resolved by the *Deus ex machina*, in reference to whom the official of the court of justice utters the following exhortation:

Remettez-vous, monsieur, d'une alarme si chaude.
Nous vivons sous un prince, ennemi de la fraude,
Un prince dont les yeux se font jour dans les coeurs,
Et que ne peut tromper tout l'art des imposteurs.

We may add, too, that the odious abstract[63] excess of characters so stable as, for example, Molière's "Miser," the absolutely stolid and serious subjection of whom to his idiotic passion renders any emancipation from such fetters impossible, contains in it nothing that is genuinely comic.

It is pre-eminently in this field that for compensation of such defects a fine artistic power in the accurate and exhaustive delineation of character is manifested, or a true mastery of the craft discovers its best opportunity for an admirably thought-out intrigue. As a rule the occasion for such an intrigue is supplied by the circumstance that some character or other endeavours to secure his objects by deluding some one else, such a course

appearing to harmonize with these interests and advance them. As a matter of fact, however, it only results in the contradictory situation that it is through this pernicious demand they are self-destructive. In opposition to such a plot we find as a rule a similar plot of dissembled appearances put in motion, which has for its object the like confusion of the original plotter. Such a general scheme admits of an infinite number and degree of ups and downs in the interweaving of its situations which are adapted to every conceivable subtlety. The Spaniards are, in particular, the most consummate masters in the invention of such intrigues and developments, and have composed much that is delightful and excellent in this class of work. The subject-matter generally consists of the attractive incidents of love or affairs of honour and the like. In tragedy these bring about the profoundest collisions; in comedy, however, where such qualities as pride and love that has been long experienced do not assert themselves as such, but rather by doing the reverse and in the result give the lie to themselves, such interests can merely appear to us as entirely superficial and comic.[64] A word in conclusion as to the characters who hatch and carry out such intrigues. Such are usually, following the example of the slaves in the Roman comedy, servants or menials, who have no respect for the objects of their superiors, but rather make them subordinate to their own advantage or bring them to nought, and merely present us with the amusing position, that the real masters are the servants and the masters the slaves, or at least give rise to all kinds of comic situation, which come about accidentally, or are directly the result of intention. We of course, as audience, are in the know of such mysteries, and can fortify ourselves against every sort of cunning and deceit, which often carries the most serious consequences to fathers, uncles, aunts, and the rest, all of the most respectable antecedents; and we may laugh as we please over the contradictory situations that appear before us, or are involved in such ingenious deceptions.

In this kind of way our modern comedy, generally speaking, gives play on the stage to private interests and personalities of the social life I have mentioned in their accidental vagaries, laughable features, abnormal habits and follies, partly by means of character delineation, and partly with the help of comic developments of situations and circumstances. A joviality so frank and genial as that which persists in the Aristophanic comedy as the mediating element of its resolution, does not animate this kind of comedy; or rather cases occur where it can be actually repulsive, that is to say, where that which is essentially evil, the tricks of menials, the treachery of sons and wards towards worthy men, fathers and guardians is triumphant, always assuming that the persons deluded have in no way themselves been influenced by false prejudices or eccentricities of such a kind that there is some reason why they should be made to appear ridiculous in their helpless stupidity and handed over as the sport of the aims of others.

In a converse way, however, and in contrast as such to the above generally prosaic type of treatment, the modern world, too, has elaborated a world of comedy which is both truly comic and poetical in its nature. The fundamental note here again is the cheeriness of disposition, the inexhaustible resources of fun, no matter what may be the nature of miscarriage or bad luck, the exuberance and dash of what is at bottom nothing better than pure tomfoolery, and, in a word, exploited self-assurance. We have here as a result, in yet profounder expatiation, and yet more intense display of humour, whether the sphere of it be more restricted or capacious, and whether the mode of it be more or less important, what runs on parallel lines with that which Aristophanes in the ancient world and in his own field created beyond all rivalry. As the master, who in a similar way outshines all others in his field, or rather the particular portion to which I now refer, I will, though without now further entering into detail, once again emphasize the name of William Shakespeare.

*

Having completed our review of the types under which comedy is elaborated we have at last reached the absolute conclusion of our scientific inquiry. We started with symbolical art, in which the ideality of the human soul struggles to discover itself as content and configuration, and, in a word, to become an object to itself. We passed on to the plastic of classical art, which displays to human vision that which has become unveiled to itself as substantive being in man's vital personality. We reached our conclusion in the romantic art of the individual soul-life, that inward world united to the absolute medium of its self-conscious energy, which expatiates unfettered within its own ideal life of Spirit; and which, content with that realm, no longer unites itself with what is objective and particularized, and finally makes itself aware of the negative significance of such a resolution in the humour of the comic Spirit. Nevertheless we find that in this very consummation it is Comedy which opens the way to a dissolution of all that human art implies. For the aim of all art is nothing else than that identity asserted and displayed by the human Spirit, in which the eternal, the Divine, the essential and explicated truth is unfolded in the forms and phenomenal presence of the objective world to the apprehension of our external senses and our emotional life and imagination. If, however, as is the fact, comedy merely enforces this unity under a mode that annihilates it, inasmuch as the absolute substance,[65] which strives here to enforce its realized manifestation, perceives that this realization is, — through the instrumentality of those interests which have now secured an independent freedom within the embrace of the objective world of Nature,[66] and are as such exclusively directed to what is contingent and personal to the soul, — itself shattered, it follows that the presence and activity of the Absolute is no longer truly asserted in positive coalescence with the individual

characters and ends of existing objective reality, but rather solely gives effect to itself in the negative form that everything which does not correspond with itself is thereby cancelled, and all that remains is the presence of this free personal activity of soul-life which is displayed in and along with this dissolution as aware of itself and self-assured.

By such a path, then, as this we have arrived at our goal; and with the aid of our philosophical method have gathered every essential type and determinant of the beauty and conformation of art into a garland, the task of arranging which in its associate completeness belongs to the most worthy of any within the range of human science to undertake. For in human Art we are not merely dealing with playthings, however pleasant or useful they may be, but with the liberation of the human Spirit from the substance and forms of finite condition. We are occupied with the presence and reconciliation of the Absolute in sense and the phenomenal, with a revelation of truth, which is not exhausted of its wealth in natural-history, but is unfolded in the history of the world, as a constituent part of which Art supplies us with the most beautiful point of view, the most generous reward for the severe labours of our contact with objective reality and the grievous pains of knowledge. And for this reason it was impossible that our inquiry should wholly restrict itself to the criticism of individual works of art, or any mere recipe or inducement to their production. Rather it could have but the one object, namely, that of following up, of seizing and retaining in and through the instrumentality of thought the fundamental notion of beauty and art through all the stages which it passes in its process of realization.

If I may be permitted to assume that from the above explained point of view my exposition has not been wholly inadequate to general expectation, and that the bonds of obligation with which I have throughout been united to my reader in the pursuit of an object which we hold in common are now released, I will merely add the wish, it is my last word, that a bond yet more

exalted and indestructible with the idea of beauty and truth may rivet itself between us in place of that released, and establish an union which shall now and for good remain secure.

[1] *Diess treibende Pathos.* Pathos is here used to signify the emotional state. This "motive force" would give the sense.

[2] *Als konkretes Daseyn zur Existence gebracht.*

[3] *In der äusseren Objektivität.*

[4] The reference is of course to lyric composition. By *reale Individualisirung* Hegel seems to refer to the apprehension by the lyric poet of the individual subjective experience in its independent reality.

[5] What Hegel means apparently by this statement is that the results of the action are in the view of the persons concerned primarily referred to their own act of volition and sense of responsibility, and as such they modify their future intention or conduct.

[6] Poet. c. 5.

[7] *Einem collidirenden Handeln.*

[8] As lyric poetry is.

[9] Poet., c. 7.

[10] The fact should be noted, however, that in the illustration each division is a complete whole in itself.

[11] Hegel apparently means this by his reference to *die beiden ersten Elemente*, but the passage is not very clear.

[12] *Gehalt*. That is, an imaginative personality, which seizes the type and our general humanity.

[13] In this obscure passage I have rather sought to emphasize what appears to me the general sense than adhere to literal accuracy. What is contrasted is clearly the naturalism of such a diction as

Schiller's "Robbers" and the French classic diction.

[14] *Der Allgemeinheit.* We should say of "a more ideal or creative atmosphere." The creative poet imports his own universality into the final result both of diction and imaginative conception. Hegel adheres to the philosophical term, which, apart from explanation, is certainly very bald, and even, as it stands, unintelligible.

[15] It is not very clear to what Hegel here refers unless to the fact that female parts were played by youths.

[16] We should say rather "stunned as by a blow," *zerschmettert,* rather than *zerschnitten.*

[17] *Eines grossen Gemüths.* It is not clear how far the reference is to the poet or the characters. It applies to both.

[18] Poet., c. 4.

[19] Vol. i, pp. 355-379.

[20] Poet., c. 6.

[21] Apart from the practical impossibility of enforcing such a condition in modern times, Hegel appears here rather to overlook the fact that the printing of a work is of great convenience, and may even involve less expense where its repetition in several theatres is possible, and, after all, important drama is literature. Where the art is bad it is no more possible to prevent its appearance, if the artist is able to afford the expense of publication, than in any other art. In the one case as in the other public taste and the law of supply and demand are here the sole and ultimate tests. Sophocles may have written his dramas, no doubt, with a particular stage in view, but we are not therefore entitled to conclude that either he or Aristophanes would have refused assent to the publication of any or all of their works had there been a publisher willing to accept responsibility. Most certainly we may suppose that Shakespeare would not have done so, at least after due representation and revision. I have, however, met with students of Shakespeare who maintain that no complete autograph manuscript of any single drama of this poet ever existed.

[22] I think it is obvious that if we take the case of the finest musical reproduction by individual artists of the first rank this distinction is not so emphatic as Hegel would make it out to be. A really great musical performance is something much more than a reproduction of musical sound. The effect of personality plays here a part of real and essential importance.

[23] *Rollenfächer.* Hegel may possibly mean "the professional adjustment of harmonious castes."

[24] See vol. iii, pp. 427-430.

[25] *Unmittelbaren Individualität.* Hegel means the individuality that is abstract, not soldered into the substance of concrete human life.

[26] *Das Göttliche.*

[27] *In Gegentheil seiner.* Hegel means, apparently, that the principle asserts itself positively rather than as the mere negation of the finite, as in exclusive asceticism.

[28] *Das Sittliche*, *i.e.,* concrete ethical condition.

[29] Hegel appears to understand by pathos here little more than a psychological state.

[30] *Element*, *i.e.,* apparently, "this primitive impulse of realization."

[31] Hegel's language, *wenn sie itzt aber wirklich*, seems to go as far as my translation. The difficulty of the entire passage, and it is no doubt considerable, is primarily due to the fact that Hegel is here importing into the notion of classic divinities the profounder significance of what he calls *sittlichen Mächte*. By doing this he can more readily shelve the problem how we are to regard the nature of their existence as potential forces of the Divine Being; that is, apart from their operative energy in human life, as also the *modus operandi* of such Divine energy in its original participation with a real world. He avoids, no doubt, one of the most disputed aspects of his philosophy. But if it is urged in criticism that at least in part his present exposition tends rather to vagueness, or at least to accept a certain measure of symbolism rather than remain severely on the ground of genuine philosophical method and thought, to associate itself rather with Plato than Aristotle, in the present context, at any rate, I am inclined to agree with it.

[32] *Der Gewalt des Anundfürsichseyenden.* Lit., of that which is or becomes explicit on its own account, i.e., essentially. Hegel refers, of course, to the ethical forces in the process of life.

[33] Hegel here uses the word *einig* rather in its secondary sense than in its primary one of *unique.*

[34] *Als das zu Erhaltende,* viz., the consistency of concrete life.

[35] By *ihrer unendlichen Sicherheit* Hegel refers to the stability of the principle of self-conscious, and self-assured character, which in its weakness may be merely equivalent to cocksuredness.

[36] *Wohlgemuthkeit und Zuversicht*.

[37] Hegel seems to have in his mind characters in comedy of which Falstaff may be taken as a supreme example, and Shakespeare above all the creator of many such. Roy Richmond and Sancho Panza are of the same type.

[38] *Der in der Menschenbrust waltenden Götter.*

[39] In no religious or even strictly ethical sense of course.

[40] I am not quite sure what Hegel means by his use here of the word *Versühnung*, lit., reconciliation. I presume he means a power of harmonious recovery, whether in a good sense is not quite clear.

[41] Formal as contrasted with really ethical content.

[42] *Die Substanz*. I presume this is the meaning, *i.e.*, the substantive ideality of the ethical forces inherent in man. The entire passage is sufficiently difficult to translate, or indeed wholly to follow, or at least apart from its subsequent application to the chorus of Tragedy.

[43] *Allgemeine.* Formal in the sense that such a state is not concretely realized in action, but restricts itself to the ideal homogeneity of its form.

[44] It is perhaps best to repeat Hegel's own phrase.

[45] *Die sittliche Berechtigung zu einer bestimmten That.* The context shows that Hegel does not merely mean the justification in the individual conscience, which is demanded by and perfected in such activity, but the actual ethical claim which is vindicated in such action.

[46] That is, the content of the dramatic action in Greek drama.

[47] By *Rechtfertigung* Hegel here seems to mean not so much the vindicated right as the degree of responsibility which a certain attitude of mind involves. It is the nature of the subjection to the vindicated right, or its absence.

[48] By *die subjektive Vertiefung der Persönlichkeit* Hegel would seem to mean the psychological analysis of character on its own account.

[49] *Blosser Ausgleichung.* The metaphor seems to be that of a final settlement of accounts, a general settlement would be perhaps a better translation.

[50] Hegel's statement is hardly supported by the facts as they are narrated in the "Œdipus Rex." It is the force of facts rather than a power of prevision, which arouse the knowledge of the terrible truth. But Hegel is here evidently most absorbed in the ideal and universal significance of the drama.

[51] That is, of course, in death. Sophocles himself of course only very indefinitely, through the evidence of an eye-witness, refers to such a possible apotheosis.

[52] The statement of the general contrast is no doubt true enough. It may be doubted, however, whether Hegel's own interpretation of the reconciliation of Œdipus as one consummated in death can be wholly brought under the ancient conception. It would seem truer to admit that in the spirit at least of the "Œdipus Coloneus" we have, at least in so far as that reconciliation is objective, and not merely a reconciling influence on our minds, the spectators, as in the case of the deaths of King Lear or Cornelia, in the sense that "death makes all things sweet," a mysterious approach to problems which Christianity first attempted seriously to solve, and which are usually regarded as insoluble without the assumption of a future state, or at least a divine absorption. Even admitting that Œdipus in his death became a real constituent of the harmonious unity of the civic life that received him, we cannot with truth say that such a reconciliation was one in which he shared personally, and whereof he was conscious, except in so far as he was aware of this by prevision; and to that extent the reconciliation was not in his death, but rather, as in the Christian view, a condition of the soul, a conviction that by his death he would live again, — almost identical in fact with some modern interpretations of immortality.

[53] Hegel means the conflict between the universal social interest and the private interest, between the concrete social life and the wholly private life.

[54] I think this gives the nearest approach I can make to the self-coined word *Grundwohlseyns*, lit., "the at bottom well being."

[55] *Subjektiven Substantialität.* Ideal, that is, as opposed to a substantive content based on the facts of living people. Impersonations of qualities imagined rather than portraits of living men, ideal therefore in a theoretic and bad sense.

[56] As previously stated I adopt Hegel's expression, being unable to express it otherwise better. The whole emotional condition is more or less the meaning, but it is rooted in Greek literature.

[57] *In dieser Bestimmtheit*, lit., in this particular definition of their content.

[58] Hegel may mean that the passions are opposed to each other. The nett result is the same.

[59] Lit., "Is made the tragic lever."

[60] The epithet might mean also "suggestive of personal irritation," but the other epithets rather negative this rendering.

[61] *Räderwerk.* The whole of this passage, in its theoretical analysis, is extremely difficult not merely to translate, but to follow clearly.

[62] I presume this is the meaning of *Pursche* or *Bursche*, and not merely "youngster."

[63] Abstract in the sense that the vices are detached in their extreme from concrete human nature.

[64] I have made the best I can of a very badly expressed sentence, and, as I should add, a very meagre description of the aim of modern comic drama. I am, however, not quite satisfied that it is an adequate translation, or that I have grasped what Hegel means by the words *nicht gestehen zu wollen*. It would apply very aptly to such a character as Sir Willoughby Patterne, but the pertinency of such an epithet as *lang empfunden* I fail to see. I doubt myself if we have here anything more than a chance note of Hegel tacked in by editors. The whole of the present paragraph is a very jejune description of the treatment of the love passion or affairs of honour by modern drama. A pity we cannot supplement it with the substance of Meredith's "Essay on Comedy." The passage, however, must be read as qualified by the further note lower down on the exuberance of one aspect of modern comedy. But the reference to "Comedy" in the modern sense is a mere fragment.

[65] That is, self-conscious life. The Absolute here seems to be identified with man's self-conscious activity.

[66] I think this is what Hegel must mean here by *im Elemente der Wirklichkeit*, in the element, that is, of material reality.

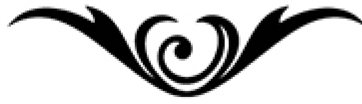
The Philosophy of History

Translated by J. Sibree

Originally delivered in lectures at the University of Berlin in 1822, 1828 and 1830, this major work presents world history in terms of the Hegelian philosophy, detailing how history follows the dictates of reason and that the natural progress of history is due to the outworking of absolute spirit. The book was originally published in 1837 by the editor Eduard Gans, six years after Hegel's death, using Hegel's own lecture notes as well as those written by his students. A second German edition was compiled by Hegel's son, Karl, in 1840. A third German edition, edited by Georg Lasson, followed in 1917.

Hegel begins by distinguishing three types of history: Original History, Reflective History and Philosophical History. Original history is deemed to be the style of Herodotus and Thucydides, in essence almost contemporaneous writings limited to deeds, events and states of society which they had before their very eyes and whose culture they shared. Reflective history is written at a temporal distance from the events or history considered. However, Hegel argues that this form of history has a tendency to impose the cultural prejudices and ideas of the historians' era upon the past history over which the historian reflects. Lastly, Philosophical history is portrayed as the true way, in which the historian must bracket his own preconceptions and discover for himself the overall sense and the driving ideas out of the very matter of the history considered.

Hegel's lectures on the philosophy of world history are often used to introduce students to his own philosophy, as Hegel's difficult style is restrained in the lectures, as he discourses on accessible themes such as world events in order to explain his philosophy. Much of the work is spent



defining and characterising *Geist* or Spirit. The *Geist* is similar to the culture of people and is constantly reworking itself to keep up with the changes of society, while at the same time working to produce those changes through what Hegel calls the "cunning of reason". In the lectures, Hegel claims that cultural awareness of *Geist* originated in ancient Judaism, connecting his history of *Geist* to a narrative of disenchantment and a decline in pagan polytheism. Another important theme of the book is its focus on world history, rather than regional or state history.

Lithograph of Hegel by Julius L. Sebbers, 1828

CONTENTS

TRANSLATOR'S INTRODUCTION

Hegel's Lectures on the Philosophy of History are recognized in Germany as a popular introduction to his system; their form is less rigid than the generality of metaphysical treatises, and the illustrations, which occupy a large proportion of the work, are drawn from a field of observation more familiar perhaps, than any other, to those who have not devoted much time to metaphysical studies. One great value of the work is that it presents the leading facts of history from an altogether novel point of view. And when it is considered that the writings of Hegel have exercised a marked influence on the political movements of Germany, it will be admitted that his theory of the universe, especially that part which bears directly upon politics, deserves attention even from those who are the most exclusive advocates of the "practical."

A writer who has established his claim to be regarded as an authority, by the life which he has infused into metaphysical abstractions, has pronounced the work before us, "one of the pleasantest books on the subject he ever read."

And compared with that of most German writers, even the style may claim to be called vigorous and pointed. If therefore in its English dress the "Philosophy of History" should be found deficient in this respect, the fault must not be attributed to the original.

It has been the aim of the translator to present his author to the public in a really English form, even at the cost of a circumlocution which must sometimes do injustice to the merits of the original. A few words however have necessarily been used in a rather unusual sense; and one of them is of very frequent occurrence. The German "Geist," in Hegel's nomenclature,

includes both intelligence and will, the latter even more expressly than the former. It embraces in fact man's entire mental and moral being, and a little reflection will make it obvious that no term in our metaphysical vocabulary could have been well substituted for the more theological one, "Spirit," as a fair equivalent. It is indeed only the impersonal and abstract use of the term that is open to objection; an objection which can be met by an appeal to the best classical usage; viz., the rendering of the Hebrew & #1514; & #1521; & #1512; and Greek pneuma in the authorized version of the Scriptures. One indisputable instance may suffice in confirmation: "Their horses [*i.e.,* of the Egyptians] are flesh and not *spirit*." (Isaiah xxxi. 3.) It is pertinent to remark here, that the comparative disuse of this term in English metaphysical literature, is one result of that alienation of theology from philosophy with which continental writers of the most opposite schools agree in taxing the speculative genius of Britain – an alienation which mainly accounts for the gulf separating English from German speculation, and which will, it is feared, on other accounts also be the occasion of communicating a somewhat uninviting aspect to the following pages.

The distinction which the Germans make between "Sittlichkeit" and "Moralität," has presented another difficulty. The former denotes conventional morality, the latter that of the heart or conscience. Where no ambiguity was likely to arise, both terms have been translated "morality." In other cases a stricter rendering has been given, modified by the requirements of the context. The word "moment" is, as readers of German philosophy are aware, a veritable crux to the translator. In Mr. J. R. Morell's very valuable edition of Johnson's Translation of Tennemann's "Manual of the History of Philosophy," the following explanation is given: "This term was borrowed from mechanics by Hegel (see his "Wissenschaft der Logik," Vol. 3, P. 104, Ed. 1841). He employs it to denote the contending forces which are mutually dependent, and whose contradiction forms an equation.

Hence his formula, *Esse* = Nothing. Here *Esse* and Nothing are momentums, giving birth to *Werden, i.e.,* Existence. Thus the momentum contributes to the same oneness of operation in contradictory forces that we see in mechanics, amidst contrast and diversity, in weight and distance, in the case of the balance." But in several parts of the work before us this definition is not strictly adhered to, and the translator believes he has done justice to the original in rendering the word by "successive" or "organic phase." In the chapter on the Crusades another term occurs which could not be simply rendered into English. The definite, positive, and present embodiment of essential being is there spoken of as "ein *Dieses*," "das *Dieses*," etc., literally "a *This,*" "the *This*," for which repulsive combination a periphrasis has been substituted, which, it is believed, is not only accurate but expository. Paraphrastic *additions,* however, have been, in fairness to the reader, enclosed in brackets [ ]; and the philosophical appropriation of ordinary terms is generally indicated by capitals, *e.g*., "Spirit," "Freedom," "State," "Nature," etc.

The limits of a brief preface preclude an attempt to explain the Hegelian method in its wider applications; and such an undertaking is rendered altogether unnecessary by the facilities which are afforded by works so very accessible as the translation of Tennemann above mentioned, Chalybseus's "Historical Development of Speculative Philosophy, from Kant to Hegel," Blakey's "History of the Philosophy of Mind," Mr. Lewes's "Biographical History of Philosophy," besides treatises devoted more particularly to the Hegelian philosophy. Among these latter may be fairly mentioned the work of a French professor, M. Vera, "Introduction à la Philosophie de Hegel," a lucid and earnest exposition of the system at large; and the very able summary of Hegel's "Philosophy of Right," by T. C. Sandars, late fellow of Oriel College, which forms one of the series of "Oxford Essays" for 1855, and which bears directly on the subject of the present volume.

It may, nevertheless, be of some service to the reader to indicate the point of view from which this "Philosophy of History" is composed, and to explain the leading idea. The aim and scope of that civilizing process which all hopeful thinkers recognize in history, is the attainment of Rational Freedom. But the very term freedom supposes a previous bondage; and the question naturally arises: "Bondage to what?" – A superficial inquirer may be satisfied with an answer referring it to the *physical power* of the ruling body. Such a response was deemed satisfactory by a large number of political speculators in the last century, and even at the beginning of the present; and it is one of the great merits of an influential thinker of our days to have expelled this *idolum fori,* which had also become an *idolum theatri,* from its undue position; and to have revived the simple truth that all stable organizations of men, all religious and political communities, are based upon principles which are far beyond the control of the One or the Many. And in these principles or some phase of them every man in every clime and age is born, lives and moves. The only question is: Whence are those principles derived? Whence spring those primary beliefs or superstitions, religious and political, that hold society together? They are no inventions of "priestcraft" or "kingcraft," for to them priestcraft and kingcraft owe their power. They are no results of a *Contrat Social,* for with them society originates. Nor are they the mere suggestions of man's weakness, prompting him to propitiate the powers of nature, in furtherance of his finite, earthborn desires. Some of the phenomena of the religious systems that have prevailed in the world might seem thus explicable; but the Nihilism of more than one Oriental creed, the suicidal strivings of the Hindoo devotee to become absorbed in a divinity recognized as a pure negation, cannot be reduced to so gross a formula; while the political superstition that ascribes a divine right to the feebleness of a woman or an infant is altogether untouched by it. Nothing is left therefore but to recognize them as "fancies," "delusions,"

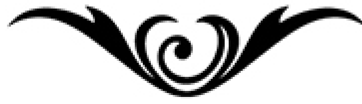
“dreams,” the results of man’s vain imagination – to class them with the other absurdities with which the abortive past of humanity is by some thought to be only too replete; or, on the other hand, to regard them as the rudimentary teachings of that essential intelligence in which man’s intellectual and moral life originates. With Hegel they are the objective manifestation of infinite reason – the first promptings of Him who having “made of one blood all nations of men for to dwell on the face of the earth, hath determined *the times before appointed,* and the bounds of their habitation, if haply they might feel after and find him” – tou gar kai genos esmen. And it is these kaitoi protetagmenoi*,* these determined and organic epochs in the history of the world that Hegel proposes to distinguish and develop in the following treatise. Whatever view may be entertained as to the origin or importance of those elementary principles, and by whatever general name they may be called – Spontaneous, Primary, or Objective Intelligence – it seems demonstrable that it is in some sense or other to its *own* belief, its *own* reason or essential being, that imperfect humanity is in bondage; while the perfection of social existence is commonly regarded as a deliverance from that bondage. In the Hegelian system, this paradoxical condition is regarded as one phase of that antithesis which is presented in all spheres of existence, between the subjective and the objective, but which it is the result of the natural and intellectual processes that constitute the life of the universe, to annul by merging into one absolute existence. And however startling this theory may be as applied to other departments of nature and intelligence, it appears to be no unreasonable formula for the course of civilization, and which is substantially as follows: In less cultivated nations, political and moral restrictions are looked upon as objectively posited; the constitution of society, like the world of natural objects, is regarded as something into which a man is inevitably born; and the individual feels himself bound to comply with requirements of whose

justice or propriety he is not allowed to judge, though they often severely test his endurance, and even demand the sacrifice of his life. In a state of high civilization, on the contrary, though an equal self-sacrifice be called for, it is in respect of laws and institutions which are felt to be just and desirable. This change of relation may, without any very extraordinary use of terms, or extravagance of speculative conceit, be designated the harmonization or reconciliation of objective and subjective intelligence. The successive phases which humanity has assumed in passing from that primitive state of bondage to this condition of rational freedom form the chief subject of the following lectures.

The mental and moral condition of individuals and their social and religious conditions (the subjective and objective manifestations of reason) exhibit a strict correspondence with each other in every grade of progress. “They that make them are like unto them,” is as true of religious and political ideas as of religious and political idols. Where man sets no value on that part of his mental and moral life which makes him superior to the brutes, brute life will be an object of worship and bestial sensuality will be the genius of the ritual. Where mere inaction is the *finis bonorum,* absorption in nothingness will be the aim of the devotee. Where, on the contrary, active and vigorous virtue is recognized as constituting the real value of man – where subjective spirit has learned to assert its own freedom, both against irrational and unjust requirements from without, and caprice, passion, and sensuality, from within, it will demand a living, acting, just, and holy, embodiment of Deity as the only possible object of its adoration. In the same degree, political principles also will be affected. Where mere nature predominates, no legal relations will be acknowledged but those based on natural distinction; rights will be inexorably associated with “caste.” Where, on the other hand, spirit has attained its freedom, it will require a code of laws and political constitution, in which the rational

subordination of nature to reason that prevails in its own being, and the strength it feels to resist sensual seductions shall be distinctly mirrored.

Between the lowest and highest grades of intelligence and will, there are several intervening stages, around which a complex of derivative ideas, and of institutions, arts, and sciences, in harmony with them, are aggregated. Each of these aggregates has acquired a name in history as a distinct nationality. Where the distinctive principle is losing its vigor, as the result of the expansive force of mind of which it was only the temporary embodiment, the national life declines, and we have the transition to a higher grade, in which a comparatively abstract and limited phase of subjective intelligence and will – to which corresponds an equally imperfect phase of objective reason – is exchanged for one more concrete, and vigorous – one which develops human capabilities more freely and fully, and in which right is more adequately comprehended.



The goal of this contention is, as already indicated, the self-realization, the complete development of spirit, whose proper nature is freedom – freedom in both senses of the term, *i.e.* liberation from *outward* control – inasmuch as the law to which it submits has its own explicit sanction – and emancipation from the *inward* slavery of lust and passion.

The above remarks are not designed to afford anything like a complete or systematic analysis of Hegel's "Philosophy of History," but simply to indicate its leading conception, and if possible to contribute something towards removing a prejudice against it on the score of its resolving facts into mystical paradoxes, or attempting to construe them *à priori.* In applying the theory, some facts may not improbably have been distorted, some brought into undue prominence, and others altogether neglected. In the most cautious and limited analysis of the past, failures and perversions of this kind are inevitable: and a comprehensive view of history is proportionately open to mistake. But it is another question whether the

principles applied in this work to explain the course which civilization has followed, are a correct inference from historical facts, and afford a reliable clue to the explanation of their leading aspects. The translator would remark, in conclusion, that the “Introduction” will probably be found the most tedious and difficult part of the treatise; he would therefore suggest a cursory reading of it in the first instance, and a second perusal as a *resume* of principles which are more completely illustrated in the body of the work.

J. Sibree.

CHARLES HEGEL'S PREFACE

THE CHANGED FORM in which Hegel's lectures on the Philosophy of History are re-issued, suggests the necessity of some explanation respecting the relation of this second edition both to the original materials from which the work was compiled, and to their first publication.

The lamented Professor Gans, the editor of the "Philosophy of History," displayed a talented ingenuity in transforming lectures into a book; in doing so he followed for the most part Hegel's latest deliveries of the course, because they were the most popular, and appeared most adapted to his object. He succeeded in presenting the lectures much as they were delivered in the winter of 1830-31; and this result might be regarded as perfectly satisfactory, if Hegel's various readings of the course had been more uniform and concordant, if indeed they had not rather been of such a nature as to supplement each other. For however great may have been Hegel's power of condensing the wide extent of the phenomenal world by thought, it was impossible for him entirely to master and to present in a uniform shape the immeasurable material of history in the course of one semester. In the first delivery in the winter of 1822-23, he was chiefly occupied with unfolding the philosophical idea, and showing how this constitutes the real kernel of history, and the impelling soul of world-historical peoples. In proceeding to treat of China and India, he wished, as he said himself, only to show by example how philosophy ought to comprehend the character of a nation; and this could be done more easily in the case of the stationary nations of the East, than in that of peoples which have a *bona, fide* history and a historical development of character. A warm predilection made him linger long with the Greeks, for whom he always felt a youthful enthusiasm;

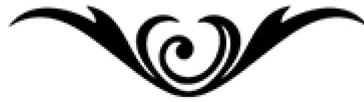
and after a brief consideration of the Roman World he endeavored finally to condense the Mediaeval Period and the Modern Time into a few lectures; for time pressed, and when, as in the Christian World, the thought no longer lies concealed among the multitude of phenomena, but announces itself and is obviously present in history, the philosopher is at liberty to abridge his discussion of it; in fact, nothing more is needed than to indicate the impelling idea. In the later readings, on the other hand, China, India, and the East generally were more speedily despatched, and more time and attention devoted to the German World. By degrees the philosophical and abstract occupied less space, the historical matter was expanded, and the whole became more popular. It is easy to see how the different readings of the course supplement each other, and how the entire substance cannot be gathered without uniting the philosophical element which predominates in the earlier, and which must constitute the basis of the work, with the historical expansion which characterizes the latest deliveries.

Had Hegel pursued the plan which most professors adopt, in adapting notes for use in the lecture room, of merely appending emendations and additions to the original draught, it would be correct to suppose that his latest readings would be also the most matured. But as, on the contrary, every delivery was with him a new act of thought, each gives only the expression of that degree of philosophical energy which animates his mind at the time; thus, in fact, the two first deliveries of 1822-23 and 1824-25, exhibit a far more comprehensive vigor of idea and expression, a far richer store of striking thoughts and appropriate images, than those of later date; for that first inspiration which accompanied the thoughts when they first sprang into existence, could only lose its living freshness by repetition.

From what has been said, the nature of the task which a new edition involved is sufficiently manifest. A treasury of thought of no trifling value had to be recovered from the first readings, and the tone of originality

restored to the whole. The printed text therefore was made the basis, and the work of inserting, supplementing, substituting, and transforming (as the case seemed to require), was undertaken with the greatest possible respect for the original. No scope was left for the individual views of the editor, since in all such alterations Hegel's manuscripts were the sole guide. For while the first publication of these lectures – a part of the introduction excepted – followed the notes of the hearers only, the second edition has endeavored to supplement it by making Hegel's own manuscripts the basis throughout, and using the notes only for the purpose of rectification and arrangement. The editor has striven after uniformity of tone through the whole work simply by allowing the author to speak everywhere in his own words; so that not only are the new insertions taken verbatim from the manuscripts, but even where the printed text was retained in the main, peculiar expressions which the hearer had lost in transcription, were restored.

For the benefit of those who place vigor of thought in a formal schematism, and with polemical zeal assert its exclusive claim against other styles of philosophizing, the remark may be added that Hegel adhered so little to the subdivisions which he had adopted, that he made some alterations in them on occasion of every reading of the course – treated Buddhism and Lamaism, *e.g.,* sometimes before, sometimes after India, sometimes reduced the Christian World more closely to the German nations, sometimes took in the Byzantine Empire, and so on. The new edition has had but few alterations to make in this respect. When the association for publishing Hegel's works did me the honor to intrust me with the re-editing of my father's "Philosophy of History," it also named as advocates of the claims of the first edition, and as representatives of Professor Gans, who had been removed from its circle by death, three of its members, Geh. Ober-Regierungs Rath Dr. Schulze, Professor von Henning, and Professor Hotho,



to whose revision the work in its new shape was to be submitted. In this revision, I not only enjoyed the acquiescence of those most estimable men and valued friends in the alterations I had made, but also owe them a debt of thanks for many new emendations, which I take the opportunity of thus publicly discharging.

In conclusion, I feel constrained to acknowledge that my gratitude to that highly respected association for the praiseworthy deed of love to science, friendship, and disinterestedness, whose prosecution originated it and still holds it together, could be increased only by the fact of its having granted me also a share in editing the works of my beloved father.

CHARLES HEGEL.

Lectures

INTRODUCTION.

THE SUBJECT OF this course of Lectures is the Philosophical History of the World. And by this must be understood, not a collection of general observations respecting it, suggested by the study of its records, and proposed to be illustrated by its facts, but Universal History itself. To gain a clear idea, at the outset, of the nature of our task, it seems necessary to begin with an examination of the other methods of treating History. The various methods may be ranged under three heads:

I. Original History.
II. Reflective History.
III. Philosophical History.

I. Of the first kind, the mention of one or two distinguished names will furnish a definite type. To this category belong *Herodotus, Thucydides,* and other historians of the same order, whose descriptions are for the most part limited to deeds, events, and states of society, which they had before their eyes, and whose spirit they shared. They simply transferred what was passing in the world around them, to the realm of representative intellect. An external phenomenon is thus translated into an internal conception. In the same way the *poet* operates upon the material supplied him by his emotions; projecting it into an image for the conceptive faculty. These original historians did, it is true, find statements and narratives of other men ready to hand. One person cannot be an eye or ear witness of everything. But they make use of such aids only as the poet does of that heritage of an already-formed language, to which he owes so much: merely as an

ingredient. Historiographers bind together the fleeting elements of story, and treasure them up for immortality in the Temple of Mnemosyne. Legends, Balladstories, Traditions, must be excluded from such original history. These are but dim and hazy forms of historical apprehension, and therefore belong to nations whose intelligence is but half awakened. Here, on the contrary, we have to do with people fully conscious of what they were and what they were about. The domain of reality – actually seen, or capable of being so – affords a very different basis in point of firmness from that fugitive and shadowy element, in which were engendered those legends and poetic dreams whose historical prestige vanishes, as soon as nations have attained a mature individuality.

Such original historians, then, change the events, the deeds, and the states of society with which they are conversant, into an object for the conceptive faculty. The narratives they leave us cannot, therefore, be very comprehensive in their range. Herodotus, Thucydides, Guicciardini, may be taken as fair samples of the class in this respect. What is present and living in their environment is their proper material. The influences that have formed the writer are identical with those which have moulded the events that constitute the matter of his story. The author's spirit, and that of the actions he narrates, is one and the same. He describes scenes in which he himself has been an actor, or at any rate an interested spectator. It is short periods of time, individual shapes of persons and occurrences, single, unreflected traits, of which he makes his picture. And his aim is nothing more than the presentation to posterity of an image of events as clear as that which he himself possessed in virtue of personal observation, or life-like descriptions. Reflections are none of his business, for he lives in the spirit of his subject; he has not attained an elevation above it. If, as in Caesar's case, he belongs to the exalted rank of generals or statesmen, it is the prosecution of *his own aims* that constitutes the history.

Such speeches as we find in Thucydides (for example) of which we can positively assert that they are not *bona fide* reports, would seem to make against out statement that a historian of his class presents us no reflected picture; that persons and people appear in his works in *propria persona.* Speeches, it must be allowed, are veritable transactions in the human commonwealth; in fact, very gravely influential transactions. It is indeed, often said, “Such and such things are only talk;” by way of demonstrating their harmlessness. That for which this excuse is brought may be mere “talk”; and talk enjoys the important privilege of being harmless. But addresses of peoples to peoples, or orations directed to nations and to princes, are integrant constituents of history. Granted that such orations as those of Pericles – that most profoundly accomplished, genuine, noble statesman – were elaborated by Thucydides, it must yet be maintained that they were not foreign to the character of the speaker. In the orations in question, these men proclaim the maxims adopted by their countrymen, and which formed their own character; they record their views of their political relations, and of their moral and spiritual nature; and the principles of their designs and conduct. What the historian puts into their mouths is no supposititious system of ideas, but an uncorrupted transcript of their intellectual and moral habitudes.

Of these historians, whom we must make thoroughly our own, with whom we must linger long, if we would live with their respective nations, and enter deeply into their spirit: of these historians, to whose pages we may turn not for the purposes of erudition merely, but with a view to deep and genuine enjoyment, there are fewer than might be imagined. Herodotus the *Father,* i.e., the *Founder* of History, and Thucydides have been already mentioned. Xenophon’s *Retreat of the Ten Thousand,* is a work equally original. Caesar’s *Commentaries* are the simple masterpiece of a mighty spirit. Among the ancients, these annalists were necessarily great captains

and statesmen. In the Middle Ages, if we except the Bishops, who were placed in the very centre of the political world, the Monks monopolize this category as naive chroniclers who were as decidedly *isolated* from active life as those elder annalists had been connected with it. In modern times the relations are entirely altered. Our culture is essentially comprehensive, and immediately changes all events into historical representations. Belonging to the class in question, we have vivid, simple, clear narrations – especially of military transactions – which might fairly take their place with those of Caesar. In richness of matter and fulness of detail as regards strategic appliances, and attendant circumstances, they are even more instructive. The French “Mémoires,” also, fall under this category. In many cases these are written by men of mark, though relating to affairs of little note. They not unfrequently contain a large proportion of anecdotal matter, so that the ground they occupy is narrow and trivial. Yet they are often veritable masterpieces in history; as those of Cardinal de Retz, which in fact trench on a larger historical field. In Germany such masters are rare. Frederick the Great (“Histoire de Mon Temps”) is an illustrious exception. Writers of this order must occupy an elevated position. Only from such a position is it possible to take an extensive view of affairs – to see everything. This is out of the question for him, who from below merely gets a glimpse of the great world through a miserable cranny.

II. The second kind of history we may call the *reflective.* It is history whose mode of representation is not really confined by the limits of the time to which it relates, but whose spirit transcends the present. In this second order a strongly marked variety of species may be distinguished.

1. It is the aim of the investigator to gain a view of the entire history of a people or a country, or of the world, in short, what we call *Universal History.* In this case the working up of the historical material is the main point. The workman approaches his task with *his own* spirit; a spirit distinct

from that of the element he is to manipulate. Here a very important consideration will be the principles to which the author refers the bearing and motives of the actions and events which he describes, and those which determine the form of his narrative. Among us Germans this reflective treatment and the display of ingenuity which it occasions assume a manifold variety of phases. Every writer of history proposes to himself an original method. The English and French confess to general principles of historical composition. Their standpoint is more that of cosmopolitan or of national culture. Among us each labors to invent a purely individual point of view. Instead of writing history, we are always beating our brains to discover how history ought to be written. This first kind of Reflective History is most nearly akin to the preceding, when it has no farther aim than to present the annals of a country complete. Such compilations (among which may be reckoned the works of Livy, Diodorus Siculus, Johannes von Müller's History of Switzerland) are, if well performed, highly meritorious.

Among the best of the kind may be reckoned such annalists as approach those of the first class; who give so vivid a transcript of events that the reader may well fancy himself listening to contemporaries and eye-witnesses. But it often happens that the individuality of tone which must characterize a writer belonging to a different culture is not modified in accordance with the periods such a record must traverse. The spirit of the writer is quite other than that of the times of which he treats. Thus Livy puts into the mouths of the old Roman kings, consuls, and generals such orations as would be delivered by an accomplished advocate of the Livian era, and which strikingly contrast with the genuine traditions of Roman antiquity (*e.g.,* the fable of Menenius Agrippa). In the same way he gives us descriptions of battles, as if he had been an actual spectator; but whose features would serve well enough for battles in any period, and whose distinctness contrasts on the other hand with the want of connection and the

inconsistency that prevail elsewhere, even in his treatment of chief points of interest. The difference between such a compiler and an original historian may be best seen by comparing Polybius himself with the style in which Livy uses, expands, and abridges his annals in those periods of which Polybius's account has been preserved. Johannes von Müller has given a stiff, formal, pedantic aspect to his history, in the endeavor to remain faithful in his portraiture to the times he describes. We much prefer the narratives we find in old Tschudy. All is more naive and natural than it appears in the garb of a fictitious and affected archaism.

A history which aspires to traverse long periods of time, or to be universal, must indeed forego the attempt to give individual representations of the past as it actually existed. It must foreshorten its pictures by abstractions; and this includes not merely the omission of events and deeds, but whatever is involved in the fact that Thought is, after all, the most trenchant epitomist. A battle, a great victory, a siege, no longer maintains its original proportions, but is put off with a bare mention. When Livy, *e.g.,* tells us of the wars with the Volsci, we sometimes have the brief announcement: "This year war was carried on with the Volsci."

2. A second species of Reflective History is what we may call the *Pragmatical.* When we have to deal with the Past, and occupy ourselves with a remote world, a Present rises into being for the mind – produced by its own activity, as the reward of its labor. The occurrences are, indeed, various; but the idea which pervades them – their deeper import and connection – is *one.* This takes the occurrence out of the category of the Past and makes it virtually Present. Pragmatical (didactic) reflections, though in their nature decidedly abstract, are truly and indefeasibly of the Present, and quicken the annals of the dead Past with the life of to-day. Whether, indeed, such reflections are truly interesting and enlivening, depends on the writer's own spirit. Moral reflections must here be specially

noticed – the moral teaching expected from history; which latter has not infrequently been treated with a direct view to the former. It may be allowed that examples of virtue elevate the soul, and are applicable in the moral instruction of children for impressing excellence upon their minds. But the destinies of peoples and states, their interests, relations, and the complicated tissue of their affairs, present quite another field. Rulers, Statesmen, Nations, are wont to be emphatically commended to the teaching which experience offers in history. But what experience and history teach is this – that peoples and governments never have learned anything from history, or acted on principles deduced from it. Each period is involved in such peculiar circumstances, exhibits a condition of things so strictly idiosyncratic, that its conduct must be regulated by considerations connected with itself, and itself alone. Amid the pressure of great events, a general principle gives no help. It is useless to revert to similar circumstances in the Past. The pallid shades of memory struggle in vain with the life and freedom of the Present. Looked at in this light, nothing can be shallower than the oft-repeated appeal to Greek and Roman examples during the French Revolution. Nothing is more diverse than the genius of those nations and that of our times. Johannes v. Müller, in his "Universal History," as also in his "History of Switzerland," had such moral aims in view. He designed to prepare a body of political doctrines for the instruction of princes, governments, and peoples (he formed a special collection of doctrines and reflections – frequently giving us in his correspondence the exact number of apophthegms which he had compiled in a week); but he cannot reckon this part of his labor as among the best that he accomplished. It is only a thorough, liberal, comprehensive view of historical relations (such *e.g., as* we find in Montesquieu's "Esprit des Lois") that can give truth and interest to reflections of this order. One Reflective History, therefore, supersedes another. The materials are patent to every writer: each

is likely enough to believe himself capable of arranging and manipulating them; and we may expect that each will insist upon his own spirit as that of the age in question. Disgusted by such reflective histories, readers have often returned with pleasure to a narrative adopting no particular point of view. These certainly have their value; but for the most part they offer only material for history. We Germans are content with such. The French, on the other hand, display great genius in reanimating bygone times, and in bringing the past to bear upon the present condition of things. The third form of Reflective History is the *Critical.* This deserves mention as pre-eminently the mode of treating history now current in Germany. It is not history itself that is here presented. We might more properly designate it as a History of History; a criticism of historical narratives and an investigation of their truth and credibility. Its peculiarity in point of fact and of intention, consists in the acuteness with which the writer extorts something from the records which was not in the matters recorded. The French have given us much that is profound and judicious in this class of composition. But they have not endeavored to pass a merely critical procedure for substantial history. They have duly presented their judgments in the form of critical treatises. Among us, the so-called "higher criticism," which reigns supreme in the domain of philology, has also taken possession of our historical literature. This "higher criticism" has been the pretext for introducing all the anti-historical monstrosities that a vain imagination could suggest. Here we have the other method of making the past a living reality; putting subjective fancies in the place of historical data; fancies whose merit is measured by their boldness, that is, the scantiness of the particulars on which they are based, and the peremptoriness with which they contravene the best established facts of history. The last species of Reflective History announces its fragmentary character on the very face of it. It adopts an abstract position; yet, since it takes general points of view (*e.g.,* as the

History of Art, of Law, of Religion), it forms a transition to the Philosophical History of the World. In our time this form of the history of ideas has been more developed and brought into notice. Such branches of national life stand in close relation to the entire complex of a people's annals; and the question of chief importance in relation to our subject is, whether the connection of the whole is exhibited in its truth and reality, or referred to merely external relations. In the latter case, these important phenomena (Art, Law, Religion, etc.) appear *as* purely accidental national peculiarities. It must be remarked that, when Reflective History has advanced to the adoption of general points of view, if the position taken is a true one, these are found to constitute – not a merely external thread, a superficial series – but are the inward guiding soul of the occurrences and actions that occupy a nation's annals. For, like the soul-conductor Mercury, the Idea is in truth, the leader of peoples and of the World; and Spirit, the rational and necessitated will of that conductor, is and has been the director of the events of the World's History. To become acquainted with Spirit in this its office of guidance, is the object of our present undertaking. This brings us to

III. The third kind of history – the *Philosophical.* No explanation was needed of the two previous classes; their nature was self-evident. It is otherwise with this last, which certainly seems to require an exposition or justification. The most general definition that can be given, is, that the Philosophy of History means nothing but the *thoughtful consideration of it.* Thought is, indeed, essential to humanity. It is this that distinguishes us from the brutes. In sensation, cognition, and intellection; in our instincts and volitions, as far as they are truly human, Thought is an invariable element. To insist upon Thought in this connection with history may, however, appear unsatisfactory. In this science it would seem as if Thought must be subordinate to what is given, to the realities of fact; that this is its basis and

guide: while Philosophy dwells in the region of self-produced ideas, without reference to actuality. Approaching history thus prepossessed, Speculation might be expected to treat it as a mere passive material; and, so far from leaving it in its native truth, to force it into conformity with a tyrannous idea, and to construe it, as the phrase is, "à *priori*." But as it is the business of history simply to adopt into its records what is and has been – actual occurrences and transactions; and since it remains true to its character in proportion as it strictly adheres to its data, we seem to have in Philosophy, a process diametrically opposed to that of the historiographer. This contradiction, and the charge consequently brought against speculation, shall be explained and confuted. We do not, however, propose to correct the innumerable special misrepresentations, trite or novel, that are current respecting the aims, the interests, and the modes of treating history, and its relation to Philosophy.

The only Thought which Philosophy brings with it to the contemplation of History, is the simple conception of *Reason;* that Reason is the Sovereign of the World; that the history of the world, therefore, presents us with a rational process. This conviction and intuition is a hypothesis in the domain of history as such. In that of Philosophy it is no hypothesis. It is there proved by speculative cognition, that Reason – and this term may here suffice us, without investigating the relation sustained by the Universe to the Divine Being – is *Substance,* as well as *Infinite Power;* its own *Infinite Material* underlying all the natural and spiritual life which it originates, as also the *Infinite Form* – that which sets this Material in motion. On the one hand, Reason is the *substance* of the Universe; viz., that by which and in which all reality has its being and subsistence. On the other hand, it is the *Infinite Energy* of the Universe; since Reason is not so powerless as to be incapable of producing anything but a mere ideal, a mere intention – having its place outside reality, nobody knows where; something separate and

abstract, in the heads of certain human beings. It is *the infinite complex of things,* their entire Essence and Truth. It is its own material which it commits to its own Active Energy to work up; not needing, as finite action does, the conditions of an external material of given means from which it may obtain its support, and the objects of its activity. It supplies its own nourishment, and is the object of its own operations. While it is exclusively its own basis of existence, and absolute final aim, it is also the energizing power realizing this aim; developing it not only in the phenomena of the Natural, but also of the Spiritual Universe – the History of the World. That this "Idea" or "Reason" is the *True,* the *Eternal,* the absolutely *powerful* essence; that it reveals itself in the World, and that in that World nothing else is revealed but this and its honor and glory – is the thesis which, as we have said, has been proved in Philosophy, and is here regarded as demonstrated.

In those of my hearers who are not acquainted with Philosophy, I may fairly presume, at least, the existence of a *belief* in Reason, a desire, a thirst for acquaintance with it, in entering upon this course of Lectures. It is, in fact, the wish for rational insight, not the ambition to amass a mere heap of acquirements, that should be presupposed in every case as possessing the mind of the learner in the study of science. If the clear idea of Reason is not already developed in our minds, in beginning the study of Universal History, we should at least have the firm, unconquerable faith that Reason *does* exist there; and that the World of intelligence and conscious volition is not abandoned to chance, but must show itself in the light of the self-cognizant Idea. Yet *I* am not obliged to make any such preliminary demand upon your faith. What I have said thus provisionally, and what I shall have further to say, is, even in reference to *our* branch of science, not to be regarded as hypothetical, but as a summary view of the whole; the *result of the investigation* we are about to pursue; a result which happens to be

known to *me,* because I have traversed the entire field. It is only an inference from the history of the World, that its development has been a rational process; that the history in question has constituted the rational necessary course of the World-Spirit – that Spirit whose nature is always one and the same, but which unfolds this its one nature in the phenomena of the World's existence. This must, as before stated, present itself as the ultimate *result* of History. But we have to take the latter as it is. We must proceed historically – empirically. Among other precautions we must take care not to be misled by professed historians who (especially among the Germans, and enjoying a considerable authority), are chargeable with the very procedure of which they accuse the Philosopher – introducing *à priori* inventions of their own into the records of the Past. It is, for example, a widely current fiction, that there was an original primeval people, taught immediately by God, endowed with perfect insight and wisdom, possessing a thorough knowledge of all natural laws and spiritual truth; that there have been such or such sacerdotal peoples; or, to mention a more specific averment, that there was a Roman Epos, from which the Roman historians derived the early annals of their city, etc. Authorities of this kind we leave to those talented historians by profession, among whom (in Germany at least) their use is not uncommon. – We might then announce it as the first condition to be observed, that we should faithfully adopt all that is historical. But in such general expressions themselves, as "faithfully" and "adopt," lies the ambiguity. Even the ordinary, the "impartial" historiographer, who believes and professes that he maintains a simply receptive attitude; surrendering himself only to the data supplied him – is by no means passive as regards the exercise of his thinking powers. He brings his categories with him, and sees the phenomena presented to his mental vision, exclusively through these media. And, especially in all that pretends to the name of science, it is indispensable that Reason should not sleep –

that reflection should be in full play. To him who looks upon the world rationally, the world in its turn presents a rational aspect. The relation is mutual. But the various exercises of reflection – the different points of view – the modes of deciding the simple question of the relative importance of events (the first category that occupies the attention of the historian), do not belong to this place.

I will only mention two phases and points of view that concern the generally diffused conviction that Reason has ruled, and is still ruling in the world, and consequently in the world's history; because they give us, at the same time, an opportunity for more closely investigating the question that presents the greatest difficulty, and for indicating a branch of the subject, which will have to be enlarged on in the sequel. I. One of these points is, that passage in history, which informs us that the Greek Anaxagoras was the first to enunciate the doctrine that nous, Understanding generally, or Reason, governs the world. It is not intelligence as self-conscious Reason – not a Spirit as such that is meant; and we must clearly distinguish these from each other. The movement of the solar system takes place according to unchangeable laws. These laws are Reason, implicit in the phenomena in question. But neither the sun nor the planets, which revolve around it according to these laws, can be said to have any consciousness of them.

A thought of this kind – that Nature is an embodiment of Reason; that it is unchangeably subordinate to universal laws, appears nowise striking or strange to us. We are accustomed to such conceptions, and find nothing extraordinary in them. And I have mentioned this extraordinary occurrence, partly to show how history teaches, that ideas of this kind, which may seem trivial to us, have not always been in the world; that, on the contrary, such a thought makes an epoch in the annals of human intelligence. Aristotle says of Anaxagoras, as the originator of the thought in question, that he appeared as a sober man among the drunken. Socrates adopted the doctrine from

Anaxagoras, and it forthwith became the ruling idea in Philosophy – except in the school of Epicurus, who ascribed all events to chance. “I was delighted with the sentiment” – Plato makes Socrates say – “and hoped I had found a teacher who would show me Nature in harmony with Reason, who would demonstrate in each particular phenomenon its specific aim, and in the whole, the grand object of the Universe. I would not have surrendered this hope for a great deal. But how very much was I disappointed, when, having zealously applied myself to the writings of Anaxagoras, I found that he adduces only external causes, such as Atmosphere, Ether, Water, and the like.” It is evident that the defect which Socrates complains of respecting Anaxagoras’s doctrine, does not concern the principle itself, but the shortcoming of the propounder in applying it to Nature in the concrete. Nature is not deduced from that principle: the latter remains in fact a mere abstraction, inasmuch as the former is not comprehended and exhibited as a development of it – an organization produced by and from Reason. I wish, at the very outset, to call your attention to the important difference between a conception, a principle, a truth limited to an *abstract* form and its determinate application, and concrete development. This distinction affects the whole fabric of philosophy; and among other bearings of it there is one to which we shall have to revert at the close of our view of Universal History, in investigating the aspect of political affairs in the most recent period.

We have next to notice the rise of this idea – that Reason directs the World – in connection with a further application of it, well known to us – in the form, viz., of the *religious truth,* that the world is not abandoned to chance and external contingent causes, but that a *Providence* controls it. I stated above, that I would not make a demand on your faith, in regard to the principle announced. Yet I might appeal to your belief in it, *in this religious aspect,* if, as a general rule, the nature of philosophical science allowed it to

attach authority to presuppositions. To put it in another shape – this appeal is forbidden, because the science of which we have to treat, proposes itself to furnish the proof (not indeed of the abstract *Truth* of the doctrine, but) of its correctness as compared with facts. The truth, then, that a Providence (that of God) presides over the events of the World – consorts with the proposition in question; for *Divine* Providence is Wisdom, endowed with an infinite Power, which realizes its aim, viz., the absolute rational design of the World. Reason is Thought conditioning itself with perfect freedom. But a difference – rather a contradiction – will manifest itself, between this belief and our principle, just as was the case in reference to the demand made by Socrates in the case of Anaxagoras's dictum. For that belief is similarly indefinite; it is what is called a belief in a general Providence, and is not followed out into definite application, or displayed in its bearing on the grand total – the entire course of human history. But to *explain* History is to depict the passions of mankind, the genius, the active powers, that play their part on the great stage; and the providentially determined process which these exhibit, constitutes what is generally called the "plan" of Providence. Yet it is this very plan which is supposed to be concealed from our view: which it is deemed presumption, even to wish to recognize. The ignorance of Anaxagoras, as to how intelligence reveals itself in actual existence, was ingenuous. Neither in his consciousness, nor in that of Greece at large, had that thought been farther expanded. He had not attained the power to apply his general principle to the concrete, so as to deduce the latter from the former. It was Socrates who took the first step in comprehending the union of the Concrete with the Universal. Anaxagoras, then, did not take up a *hostile* position toward such an application. The common belief in Providence *does;* at least it opposes the use of the principle on the large scale, and denies the possibility of discerning the plan of Providence. In isolated cases this plan is supposed to be manifest. Pious

persons are encouraged to recognize in particular circumstances, something more than mere chance; to acknowledge the guiding hand of God; *e.g.,* when help has unexpectedly come to an individual in great perplexity and need. But these instances of providential design are of a limited kind, and concern the accomplishment of nothing more than the desires of the individual in question. But in the history of the World, the *Individuals* we have to do with are *Peoples;* Totalities that are States. We cannot, therefore, be satisfied with what we may call this "peddling" view of Providence, to which the belief alluded to limits itself. Equally unsatisfactory is the merely abstract, undefined belief in a Providence, when that belief is not brought to bear upon the details of the process which it conducts. On the contrary our earnest endeavor must be directed to the recognition of the ways of Providence, the means it uses, and the historical phenomena in which it manifests itself; and we must show their connection with the general principle above mentioned. But in noticing the recognition of the plan of Divine Providence generally, I have implicitly touched upon a prominent question of the day; viz., that of the possibility of knowing God: or rather – since public opinion has ceased to allow it to be a matter of *question* – the *doctrine* that it is impossible to know God. In direct contravention of what is commanded in holy Scripture as the highest duty – that we should not merely love, but *know* God – the prevalent dogma involves the denial of what is there said; viz., that it is the Spirit (der Geist) that leads into Truth, knows all things, penetrates even into the deep things of the Godhead. While the Divine Being is thus placed beyond our knowledge, and outside the limit of all human things, we have the convenient license of wandering as far as we list, in the direction of our own fancies. We are freed from the obligation to refer our knowledge to the Divine and True. On the other hand, the vanity and egotism which characterize it find, in this false position, ample justification; and the pious modesty which puts far from it

the knowledge of God can well estimate how much furtherance thereby accrues to its own wayward and vain strivings. I have been unwilling to leave out of sight the connection between our thesis – that Reason governs and has governed the World – and the question of the possibility of a knowledge of God, chiefly that I might not lose the opportunity of mentioning the imputation against Philosophy of being shy of noticing religious truths, or of having occasion to be so; in which is insinuated the suspicion that it has anything but a clear conscience in the presence of these truths. So far from this being the case, the fact is, that in recent times Philosophy has been obliged to defend the domain of religion against the attacks of several theological systems. In the Christian religion God has revealed Himself – that is, he has given us to understand what He is; so that He is no longer a concealed or secret existence. And this possibility of knowing Him, thus afforded us, renders such knowledge a duty. God wishes no narrow-hearted souls or empty heads for his children; but those whose spirit is of itself indeed poor, but rich in the knowledge of Him; and who regard this knowledge of God as the only valuable possession. That development of the thinking spirit which has resulted from the revelation of the Divine Being as its original basis must ultimately advance to the *intellectual* comprehension of what was presented in the first instance, to *feeling* and *imagination.* The time must eventually come for understanding that rich product of active Reason, which the History of the World offers to us. It was for awhile the fashion to profess admiration for the wisdom of God as displayed in animals, plants, and isolated occurrences. But, if it be allowed that Providence manifests itself in such objects and forms of existence, why not also in Universal History? This is deemed too great a matter to be thus regarded. But Divine Wisdom, *i.e.,* Reason, is one and the same in the great as in the little; and we must not imagine God to be too weak to exercise his wisdom on the grand scale. Our intellectual striving

aims at realizing the conviction that what was *intended* by eternal wisdom, is actually *accomplished* in the domain of existent, active Spirit, as well as in that of mere Nature. Our mode of treating the subject is, in this aspect, a Theodicaea – a justification of the ways of God – which Leibnitz attempted metaphysically, in his method, *i.e.,* in indefinite abstract categories – so that the ill that is found in the World may be comprehended, and the thinking Spirit reconciled with the fact of the existence of evil. Indeed, nowhere is such a harmonizing view more pressingly demanded than in Universal History; and it can be attained only by recognizing the *positive* existence, in which that negative element is a subordinate, and vanquished nullity. On the one hand, the ultimate design of the World must be perceived; and, on the other hand, the fact that this design has been actually realized in it, and that evil has not been able permanently to assert a competing position. But this superintending vows, or in "Providence." "Reason," whose sovereignty over the World has been maintained, is as indefinite a term as "Providence," supposing the term to be used by those who are unable to characterize it distinctly – to show wherein it consists, so as to enable us to decide whether a thing is rational or irrational. An adequate definition of Reason is the first desideratum; and whatever boast may be made of strict adherence to it in explaining phenomena – without such a definition we get no farther than mere words. With these observations we may proceed to the second point of view that has to be considered in this Introduction.

II. The inquiry into the *essential destiny* of Reason – as far as it is considered in reference to the World – is identical with the question, *what is the ultimate design of the World?* And the expression implies that that design is destined to be realized. Two points of consideration suggest themselves; first, the *import* of this design – its abstract definition; and secondly, its *realization.*

It must be observed at the outset, that the phenomenon we investigate – Universal History – belongs to the realm of *Spirit.* The term " *World,"* includes both physical and psychical Nature. Physical Nature also plays its part in the World's History, and attention will have to be paid to the fundamental natural relations thus involved. But Spirit, and the course of its development, is our substantial object. Our task does not require us to contemplate Nature as a Rational System in itself – though in its own proper domain it proves itself such – but simply in its relation to *Spirit.* On the stage on which we are observing it – Universal History – Spirit displays itself in its most concrete reality. Notwithstanding this (or rather for the very purpose of comprehending the *general* principles which this, its form of *concrete reality,* embodies) we must premise some abstract characteristics of the *nature of Spirit.* Such an explanation, however, cannot be given here under any other form than that of bare assertion. The present is not the occasion for unfolding the idea of Spirit speculatively; for whatever has a place in an Introduction, must, as already observed, be taken as simply historical; something assumed as having been explained and proved elsewhere; or whose demonstration awaits the sequel of the Science of History itself. We have therefore to mention here: (1) The abstract characteristics of the nature of Spirit. (2) What means Spirit uses in order to realize its Idea. (3) Lastly, we must consider the shape which the perfect embodiment of Spirit assumes – the State, (1) The nature of Spirit may be understood *by* a glance at its direct opposite – *Matter. As* the essence of Matter is Gravity, so, on the other hand, we may affirm that the substance, the essence of Spirit is Freedom. All will readily assent to the doctrine that Spirit, among other properties, is also endowed with Freedom; but philosophy teaches that all the qualities of Spirit exist only through Freedom; that all are but means for attaining Freedom; that all seek and produce this and this alone. It is a result of speculative Philosophy that

Freedom is the sole truth of Spirit. Matter possesses gravity in virtue of its tendency toward a central point. It is essentially composite; consisting of parts that *exclude* each other. It seeks its Unity; and therefore exhibits itself as self-destructive, as verging toward its opposite [an indivisible point]. If it could attain this, it would be Matter no longer, it would have perished. It strives after the realization of its Idea; for in Unity it exists *ideally.* Spirit, on the contrary, may be defined as that which has its centre in itself. It has not a unity outside itself, but has already found it; it exists *in* and *with itself.* Matter has its essence out of itself; Spirit is *self-contained existence* (*Bei-sich-selbst-seyn*). Now this is Freedom, exactly. For if I am dependent, my being is referred to something else which I am not; I cannot exist independently of something external. I am free, on the contrary, when my existence depends upon myself. This self-contained existence of Spirit is none other than self-consciousness – consciousness of one's own being. Two things must be distinguished in consciousness; first, the fact *that I know;* secondly, *what I know.* In *self* consciousness these are merged in one; for Spirit *knows itself.* It involves an appreciation of its own nature, as also an energy enabling it to realize itself; to make itself *actually* that which it is *potentially.* According to this abstract definition it may be said of Universal History, that it is the exhibition of Spirit in the process of working out the knowledge of that which it is potentially. And as the germ bears in itself the whole nature of the tree, and the taste and form of its fruits, so do the first traces of Spirit virtually contain the whole of that History. The Orientals have not attained the knowledge that Spirit – Man *as such* – is free; and because they do not know this, they are not free. They only know that *one is free.* But on this very account, the freedom of that one is only caprice; ferocity – brutal recklessness of passion, or a mildness and tameness of the desires, which is itself only an accident of Nature – mere caprice like the former. – That *one* is therefore only a Despot; not a *free man.* The

consciousness of Freedom first arose among the Greeks, and therefore they were free; but they, and the Romans likewise, knew only that *some* are free – not man as such. Even Plato and Aristotle did not know this. The Greeks, therefore, had slaves; and their whole life and the maintenance of their splendid liberty, was implicated with the institution of slavery: a fact moreover, which made that liberty on the one hand only an accidental, transient and limited growth; on the other hand, constituted it a rigorous thraldom of our common nature – of the Human. The German nations, under the influence of Christianity, were the first to attain the consciousness that man, as man, is free: that it is the *freedom* of Spirit which constitutes its essence. This consciousness arose first in religion, the inmost region of Spirit; but to introduce the principle into the various relations of the actual world involves a more extensive problem than its simple implantation; a problem whose solution and application require a severe and lengthened process of culture. In proof of this, we may note that slavery did not cease immediately on the reception of Christianity. Still less did liberty predominate in States; or Governments and Constitutions adopt a rational organization, or recognize freedom as their basis. That application of the principle to political relations; the thorough moulding and interpenetration of the constitution of society by it, is a process identical with history itself. I have already directed attention to the distinction here involved, between a principle as such, and its *application; i.e.,* its introduction and carrying out in the actual phenomena of Spirit and Life. This is a point of fundamental importance in our science, and one which must be constantly respected as essential. And in the same way as this distinction has attracted attention in view of the *Christian* principle of selfconsciousness – Freedom; it also shows itself as an essential one, in view of the principle of Freedom *generally.* The History of the world is none other than the progress of the consciousness of Freedom; a progress whose development according to the

necessity of its nature, it is our business to investigate. The general statement given above, of the various grades in the consciousness of Freedom – and which we applied in the first instance to the fact that the Eastern nations knew only that *one* is free; the Greek and Roman world only that *some* are free; while *we* know that all men absolutely (man *as man)* are free – supplies us with the natural division of Universal History, and suggests the mode of its discussion. This is remarked, however, only incidentally and anticipatively; some other ideas must be first explained.

The destiny of the spiritual World, and – since this is the *substantial World,* while the physical remains subordinate to it, or, in the language of speculation, has no truth *as against* the spiritual – *the final cause of the World at large,* we allege to be the *consciousness* of its own freedom on the part of Spirit, and *ipso facto,* the *reality* of that freedom. But that this term "Freedom," without further qualification, is an indefinite, and incalculable ambiguous term; and that while that which it represents is the *ne plus ultra* of attainment, it is liable to an infinity of misunderstandings, confusions and errors, and to become the occasion for all imaginable excesses – has never been more clearly known and felt than in modern times. Yet, for the present, we must content ourselves with the term itself without farther definition. Attention was also directed to the importance of the infinite difference between a principle in the abstract, and its realization in the concrete. In the process before us, the essential nature of freedom – which involves in it absolute necessity – is to be displayed as coming to a consciousness of itself (for it is in its very nature, self-consciousness) and thereby realizing its existence. Itself is its own object of attainment, and the sole aim of Spirit. This result it is, at which the process of the World's History has been continually aiming; and to which the sacrifices that have ever and anon been laid on the vast altar of the earth, through the long lapse of ages, have been offered. This is the only aim that sees itself realized and fulfilled; the

only pole of repose amid the ceaseless change of events and conditions, and the sole efficient principle that pervades them. This final aim is God's purpose with the world; but God is the absolutely perfect Being, and can, therefore, will nothing other than himself – his own Will. The Nature of His Will – that is, His Nature itself – is what we here call the Idea of Freedom; translating the language of Religion into that of Thought. The question, then, which we may next put is: What means does this principle of Freedom use for its realization? This is the second point we have to consider. (2) The question of the *means* by which Freedom develops itself to a World, conducts us to the phenomenon of History itself. Although Freedom is, primarily, an undeveloped idea, the means it uses are external and phenomenal; presenting themselves in History to our sensuous vision. The first glance at History convinces us that the actions of men proceed from their needs, their passions, their characters and talents; and impresses us with the belief that such needs, passions and interests are the sole springs of action – the efficient agents in this scene of activity. Among these may, perhaps, be found aims of a liberal or universal kind – benevolence it may be, or noble patriotism; but such virtues and general views are but insignificant as compared with the World and its doings. We may perhaps see the Ideal of Reason actualized in those who adopt such aims, and within the sphere of their influence; but they bear only a trifling proportion to the mass of the human race; and the extent of that influence is limited accordingly. Passions, private aims, and the satisfaction of selfish desires, are on the other hand, most effective springs of action. Their power lies in the fact that they respect none of the limitations which justice and morality would impose on them; and that these natural impulses have a more direct influence over man than the artificial and tedious discipline that tends to order and self-restraint, law and morality. When we look at this display of passions, and the consequences of their violence; the Unreason which is

associated not only with them, but even (rather we might say *especially*) with *good* designs and righteous aims; when we see the evil, the vice, the ruin that has befallen the most flourishing kingdoms which the mind of man ever created; we can scarce avoid being filled with sorrow at this universal taint of corruption: and, since this decay is not the work of mere Nature, but of the Human Will – a moral embitterment – a revolt of the Good Spirit (if it have a place within us) may well be the result of our reflections. Without rhetorical exaggeration, a simply truthful combination of the miseries that have overwhelmed the noblest of nations and polities, and the finest exemplars of private virtue – forms a picture of most fearful aspect, and excites emotions of the profoundest and most hopeless sadness, counterbalanced by no consolatory result. We endure in beholding it a mental torture, allowing no defence or escape but the consideration that what has happened could not be otherwise; that it is a fatality which no intervention could alter. And at last we draw back from the intolerable disgust with which these sorrowful reflections threaten us, into the more agreeable environment of our individual life – the Present formed by our private aims and interests. In short we retreat into the selfishness that stands on the quiet shore, and thence enjoys in safety the distant spectacle of "wrecks confusedly hurled." But even regarding History as the slaughter-bench at which the happiness of peoples, the wisdom of States, and the virtue of individuals have been victimized – the question involuntarily arises – to what principle, to what final aim these enormous sacrifices have been offered. From this point the investigation usually proceeds to that which we have made the general commencement of our inquiry. Starting from this we pointed out those phenomena which made up a picture so suggestive of gloomy emotions and thoughtful reflections – as *the very field* which we, for our part, regard as exhibiting only the means for realizing what we assert to be the essential destiny – the absolute aim, or – which

comes to the same thing – the true *result* of the World's History. We have all along purposely eschewed "moral reflections" as a method of rising from the scene of historical specialties to the general principles which they embody. Besides, it is not the interest of such sentimentalities, really to rise above those depressing emotions; and to solve the enigmas of Providence which the considerations that occasioned them, present. It is essential to their character to find a gloomy satisfaction in the empty and fruitless sublimities of that negative result. We return them to the point of view which we have adopted; observing that the successive steps (*momente*) of the analysis to which it will lead us, will also evolve the conditions requisite for answering the inquiries suggested by the panorama of sin and suffering that history unfolds.

The *first* remark we have to make, and which – though already presented more than once – cannot be too often repeated when the occasion seems to call for it – is that what we call *principle, aim, destiny,* or the nature and idea of Spirit, is something merely general and abstract. Principle – Plan of Existence – Law – is a hidden, undeveloped essence, which *as such* – however true in itself – is not completely real. Aims, principles, etc., have a place in our thoughts, in our subjective design only; but not yet in the sphere of reality. That which exists for itself only, is a possibility, a potentiality; but has not yet emerged into Existence. A *second* element must be introduced in order to produce actuality – viz., actuation, realization; and whose motive power *is* the Will – the activity of man in the widest sense. It is only by this activity that that Idea as well as abstract characteristics generally, are realized, actualized; for of themselves they are powerless. The motive power that puts them in operation, and gives them determinate existence, is the need, instinct, inclination, and passion of man. That some conception of mine should be developed into act and existence, is my earnest desire: I wish to assert my personality in connection with it: I wish

to be satisfied by its execution. If I am to exert myself for any object, it must in some way or other be *my* object. In the accomplishment of such or such designs I must at the same time find *my* satisfaction; although the purpose for which I exert myself includes a complication of results, many of which have no interest for me. This is the absolute right of personal existence – to find *itself* satisfied in its activity and labor. If men are to interest themselves for anything, they must (so to speak) have part of their existence involved in it; find their individuality gratified by its attainment. Here a mistake must be avoided. We intend blame, and justly impute it as a fault, when we say of an individual, that he is "interested" (in taking part in such or such transactions), that is, seeks only his private advantage. In reprehending this we find fault with him for furthering his personal aims without any regard to a more comprehensive design; of which he takes advantage to promote his own interest, or which he even sacrifices with this view. But he who is active in *promoting an object* is not simply "interested," but interested in that object itself. Language faithfully expresses this distinction. – Nothing therefore happens, nothing is accomplished, unless the individuals concerned, seek their own satisfaction in the issue. They are particular units of society; *i.e.,* they have special needs, instincts, and interests generally, peculiar to themselves. Among these needs are not only such as we usually call necessities – the stimuli of individual desire and volition – but also those connected with individual views and convictions; or – to use a term expressing less decision – leanings of opinion; supposing the impulses of reflection, understanding, and reason, to have been awakened. In these cases people demand, if they are to exert themselves in any direction, that the object should commend itself to them; that in point of opinion – whether as to its goodness, justice, advantage, profit – they should be able to "enter into it" (*dabei seyn*). This is a consideration of especial importance in our age, when people are less

than formerly influenced by reliance on others, and by authority; when, on the contrary, they devote their activities to a cause on the ground of their own understanding, their independent conviction and opinion.

We assert then that nothing has been accomplished without interest on the part of the actors; and – if interest be called passion, inasmuch as the whole individuality, to the neglect of all other actual or possible interests and claims, is devoted to an object with every fibre of volition, concentrating all its desires and powers upon it – we may affirm absolutely that *nothing great in the World* has been accomplished without *passion.* Two elements, therefore, enter into the object of our investigation; the first the Idea, the second the complex of human passions; the one the warp, the other the woof of the vast arras-web of Universal History. The concrete mean and union of the two is Liberty, under the conditions of morality in a State. We have spoken of the Idea of Freedom as the nature of Spirit, and the absolute goal of History. Passion is regarded as a thing of sinister aspect, as more or less immoral. Man is required to have no passions. Passion, it is true, is not quite the suitable word for what I wish to express. I mean here nothing more than the human activity as resulting from private interests – special, or if you will, selfseeking designs – with this qualification, that the whole energy of will and character is devoted to their attainment; that other interests (which would in themselves constitute attractive aims) or rather all things else, are sacrificed to them. The object in question is so bound up with the man's will, that it entirely and alone determines the "hue of resolution," and is inseparable from it. It has become the very essence of his volition. For a person is a specific existence; not man in general (a term to which no real existence corresponds) but a particular human being. The term "character" likewise expresses this idiosyncrasy of Will and Intelligence. But *Character* comprehends all peculiarities whatever; the way in which a person conducts himself in

private relations, etc., and is not limited to his idiosyncrasy in its practical and active phase. I shall, therefore, use the term “passions”; understanding thereby the particular bent of character, as far as the peculiarities of volition are not limited to private interest, but supply the impelling and actuating force for accomplishing deeds shared in by the community at large. Passion is in the first instance the *subjective,* and therefore the *formal* side of energy, will, and activity – leaving the object or aim still undetermined. And there is a similar relation of formality to reality in merely individual conviction, individual views, individual conscience. It is always a question of essential importance, what is the purport of my conviction, what the object of my passion, in deciding whether the one or the other is of a true and substantial nature. Conversely, if it is so, it will inevitably attain actual existence – be realized.

From this comment on the second essential element in the historical embodiment of an aim, we infer – glancing at the institution of the State in passing – that a State is then well constituted and internally powerful, when the private interest of its citizens is one with the common interest of the State; when the one finds its gratification and realization in the other – a proposition in itself very important. But in a State many institutions must be adopted, much political machinery invented, accompanied by appropriate political arrangements – necessitating long struggles of the understanding before what is really appropriate can be discovered – involving, moreover, contentions with private interest and passions, and a tedious discipline of these latter, in order to bring about the desired harmony. The epoch when a State attains this harmonious conditon, marks the period of its bloom, its virtue, its vigor, and its prosperity. But the history of mankind does not begin with a *conscious* aim of any kind, as it is the case with the particular circles into which men form themselves of set purpose. The mere social instinct implies a conscious purpose of security for life and property; and

when society has been constituted, this purpose becomes more comprehensive. The History of the World begins with its general aim – the realization of the Idea of Spirit – only in an *implicit* form (*an sich*) that is, as Nature; a hidden, most profoundly hidden, unconscious instinct; and the whole process of History (as already observed), is directed to rendering this unconscious impulse a conscious one. Thus appearing in the form of merely natural existence, natural will – that which has been called the subjective side – physical craving, instinct, passion, private interest, as also opinion and subjective conception – spontaneously present themselves at the very commencement. This vast congeries of volitions, interests and activities, constitute the instruments and means of the World- Spirit for attaining its object; bringing it to consciousness, and realizing it. And this aim is none other than finding itself – coming to itself – and contemplating itself in concrete actuality. But that those manifestations of vitality on the part of individuals and peoples, in which they seek and satisfy their own purposes, are, at the same time, the means and instruments of a higher and broader purpose of which they know nothing – which they realize unconsciously – might be made a matter of question; rather has been questioned, and in every variety of form negatived, decried and contemned as mere dreaming and "Philosophy." But on this point I announced my view at the very outset, and asserted our hypothesis – which, however, will appear in the sequel, in the form of a legitimate inference – and our belief that Reason governs the world, and has consequently governed its history. In relation to this independently universal and substantial existence – all else is subordinate, subservient to it, and the means for its development. – The Union of Universal Abstract Existence generally with the Individual – the Subjective – that this alone is Truth, belongs to the department of speculation, and is treated in this general form in Logic. – But in the process of the World's History itself – as still incomplete – the abstract final aim of history is not

yet made the distinct object of desire and interest. While these limited sentiments are still unconscious of the purpose they are fulfilling, the universal principle is implicit in them, and is realizing itself through them. The question also assumes the form of the union of *Freedom* and *Necessity;* the latent abstract process of Spirit being regarded as *Necessity,* while that which exhibits itself in the conscious will of men, as their interest, belongs to the domain of *Freedom.* As the metaphysical connection (*i.e.,* the connection in the Idea) of these forms of thought, belongs to Logic, it would be out of place to analyze it here. The chief and cardinal points only shall be mentioned.

Philosophy shows that the Idea advances to an infinite antithesis; that, viz., between the Idea in its free, universal form – in which it exists for itself – and the contrasted form of abstract introversion, reflection on itself, which is formal existence-for-self, personality, formal freedom, such as belongs to Spirit only. The universal Idea exists thus as the substantial totality of things on the one side, and as the abstract essence of free volition on the other side. This reflection of the mind on itself is individual self-consciousness – the polar opposite of the Idea in its general form, and therefore existing in absolute Limitation. This polar opposite is consequently limitation, particularization, for the universal absolute being; it is the side of its *definite existence;* the sphere of its formal reality, the sphere of the reverence paid to God. – To comprehend the absolute connection of this antithesis, is the profound task of metaphysics. This Limitation originates all forms of particularity of whatever kind. The formal volition (of which we have spoken) wills itself; desires to make its own personality valid in all that it purposes and does: even the pious individual wishes to be saved and happy. This pole of the antithesis, existing for itself, is – in contrast with the Absolute Universal Being – a special separate existence, taking cognizance of specialty only, and willing that alone. In

short it plays its part in the region of mere phenomena. This is the sphere of particular purposes, in effecting which individuals exert themselves on behalf of their individuality – give it full play and objective realization. This is also the sphere of happiness and its opposite. He is happy who finds his condition suited to his special character, will, and fancy, and so enjoys himself in that condition. The History of the World is not the theatre of happiness. Periods of happiness are blank pages in it, for they are periods of harmony – periods when the antithesis is in abeyance. Reflection on self – the Freedom above described – is abstractly defined as the formal element of the activity of the absolute Idea. The realizing *activity* of which we have spoken is the middle term of the Syllogism, one of whose extremes is the Universal essence, the *Idea,* which reposes in the penetralia of Spirit; and the other, the complex of external things – objective matter. That activity is the medium by which the universal latent principle is translated into the domain of objectivity.

I will endeavor to make what has been said more vivid and clear by examples.

The building of a house is, in the first instance, a subjective aim and design. On the other hand we have, as means, the several substances required for the work – Iron, Wood, Stones.

The elements are made use of in working up this material: fire to melt the iron, wind to blow the fire, water to set wheels in motion, in order to cut the wood, etc. The result is, that the wind, which has helped to build the house, is shut out by the house; so also are the violence of rains and floods, and the destructive powers of fire, so far as the house is made fireproof. The stones and beams obey the law of gravity – press downward – and so high walls are carried up. Thus the elements are made use of in accordance with their nature, and yet to co-operate for a product, by which their operation is limited. Thus the passions of men are gratified; they develop themselves

and their aims in accordance with their natural tendencies, and build up the edifice of human society; thus fortifying a position for Right and Order *against themselves.*

The connection of events above indicated, involves also the fact, that in history an additional result is commonly produced by human actions beyond that which they aim at and obtain – that which they immediately recognize and desire. They gratify their own interest; but something further is thereby accomplished, latent in the actions in question, though not present to their consciousness, and not included in their design. An analogous example is offered in the case of a man who, from a feeling of revenge – perhaps not an unjust one, but produced by injury on the other's part – burns that other man's house. A connection is immediately established between the deed itself and a train of circumstances not directly included in it, taken abstractedly. In itself it consisted in merely presenting a small flame to a small portion of a beam. Events not involved in that simple act follow of themselves. The part of the beam which was set fire to is connected with its remote portions; the beam itself is united with the woodwork of the house generally, and this with other houses; so that a wide conflagration, ensues, which destroys the goods and chattels of many other persons besides his against whom the act of revenge was first directed; perhaps even costs not a few men their lives. This lay neither in the deed abstractedly, nor in the design of the man who committed it. But the action has a further general bearing. In the design of the doer it was only revenge executed against an individual in the destruction of his property, but it is moreover a crime, and that involves punishment also. This may not have been present to the mind of the perpetrator, still less in his intention; but his deed itself, the general principles it calls into play, its substantial content entails it. By this example I wish only to impress on you the consideration, that in a simple act, something further may be implicated than lies in the

intention and consciousness of the agent. The example before us involves, however, this additional consideration, that the substance of the act, consequently we may say the act itself, recoils upon the perpetrator – reacts upon him with destructive tendency. This union of the two extremes – the embodiment of a general idea in the form of direct reality, and the elevation of a speciality into connection with universal truth – is brought to pass, at first sight, under the conditions of an utter diversity of nature between the two, and an indifference of the one extreme towards the other. The aims which the agents set before them are limited and special; but it must be remarked that the agents themselves are intelligent thinking beings. The purport of their desires is interwoven with *general, essential* considerations of justice, good, duty, etc.; for mere desire – volition in its rough and savage forms – falls not within the scene and sphere of Universal History. Those general considerations, which form at the same time a norm for directing aims and actions, have a determinate purport; for such an abstraction as "good for its own sake," has no place in living reality. If men are to act, they must not only intend the Good, but must have decided for themselves whether this or that particular thing is a Good. What special course of action, however, is good or not, is determined, as regards the ordinary contingencies of private life, by the laws and customs of a State; and here no great difficulty is presented. Each individual has his position; he knows on the whole what a just, honorable course of conduct is. As to ordinary, private relations, the assertion that it is difficult to choose the right and good – the regarding it as the mark of an exalted morality to find difficulties and raise scruples on that score – may be set down to an evil or perverse will, which seeks to evade duties not in themselves of a perplexing nature; or, at any rate, to an idly reflective habit of mind – where a feeble will affords no sufficient exercise to the faculties – leaving them therefore to find

occupation within themselves, and to expend themselves on moral self-adulation.

It is quite otherwise with the comprehensive relations that History has to do with. In this sphere are presented those momentous collisions between existing, acknowledged duties, laws, and rights, and those contingencies which are adverse to this fixed system; which assail and even destroy its foundations and existence; whose tenor may nevertheless seem good – on the large scale advantageous – yes, even indispensable and necessary. These contingencies realize themselves in History: they involve a general principle of a different order from that on which depends the *permanence* of a people or a State. This principle is an essential phase in the development of the *creating* Idea, of Truth striving and urging towards (consciousness of) itself. Historical men – *World-Historical Individuals* – are those in whose aims such a general principle lies.

Caesar, in danger of losing a position, not perhaps at that time of superiority, yet at least of equality with the others who were at the head of the State, and of succumbing to those who were just on the point of becoming his enemies – belongs essentially to this category. These enemies – who were at the same time pursuing *their* personal aims – had the form of the constitution, and the power conferred by an appearance of justice, on their side. Caesar was contending for the maintenance of his position, honor, and safety; and, since the power of his opponents included the sovereignty over the provinces of the Roman Empire, his victory secured for him the conquest of that entire Empire; and he thus became – though leaving the form of the constitution – the Autocrat of the State. That which secured for him the execution of a design, which in the first instance was of negative import – the Autocracy of Rome – was, however, at the same time an independently necessary feature in the history of Rome and of the world. It was not, then, his private gain merely, but an unconscious impulse that

occasioned the accomplishment of that for which the time was ripe. Such are all great historical men – whose own particular aims involve those large issues which are the will of the World-Spirit. They may be called Heroes, inasmuch as they have derived their purposes and their vocation, not from the calm, regular course of things, sanctioned by the existing order; but from a concealed fount – one which has not attained to phenomenal, present existence – from that inner Spirit, still hidden beneath the surface, which, impinging on the outer world as on a shell, bursts it in pieces, because it is another kernel than that which belonged to the shell in question. They are men, therefore, who appear to draw the impulse of their life from themselves; and whose deeds have produced a condition of things and a complex of historical relations which appear to be only *their* interest, and *their* work. Such individuals had no consciousness of the general Idea they were unfolding, while prosecuting those aims of theirs; on the contrary, they were practical, political men. But at the same time they were thinking men, who had an insight into the requirements of the time – *what was ripe for development.* This was the very Truth for their age, for their world; the species next in order, so to speak, and which was already formed in the womb of time. It was theirs to know this nascent principle; the necessary, directly sequent step in progress, which their world was to take; to make this their aim, and to expend their energy in promoting it. World-historical men – the Heroes of an epoch – must, therefore, be recognized as its clear-sighted ones; *their* deeds, *their* words are the best of that time. Great men have formed purposes to satisfy themselves, not others. Whatever prudent designs and counsels they might have learned from others, would be the more limited and inconsistent features in their career; for it was they who best understood affairs; from whom *others* learned, and approved, or at least acquiesced in – their policy. For that Spirit which had taken this fresh step in history is the inmost soul of all individuals; but in a state of

unconsciousness which the great men in question aroused. Their fellows, therefore, follow these soul-leaders; for they feel the irresistible power of their own inner Spirit thus embodied. If we go on to cast a look at the fate of these World-Historical persons, whose vocation it was to be the agents of the World-Spirit – we shall find it to have been no happy one. They attained no calm enjoyment; their whole life was labor and trouble; their whole nature was nought else but their master-passion. When their object is attained they fall off like empty hulls from the kernel. They die early, like Alexander; they are murdered, like Caesar; transported to St. Helena, like Napoleon. This fearful consolation – that historical men have not enjoyed what is called happiness, and of which only private life (and this may be passed under very various external circumstances) is capable – this consolation those may draw from history, who stand in need of it; and it is craved by Envy – vexed at what is great and transcendant – striving, therefore, to depreciate it, and to find some flaw in it. Thus in modern times it has been demonstrated *ad nauseam* that princes are generally unhappy on their thrones; in consideration of which the possession of a throne is tolerated, and men acquiesce in the fact that not themselves but the personages in question are its occupants. The Free Man, we may observe, is not envious, but gladly recognizes what is great and exalted, and rejoices that it exists.

It is in the light of those common elements which constitute the interest and therefore the passions of individuals, that these historical men are to be regarded. They are *great* men, because they willed and accomplished something great; not a mere fancy, a mere intention, but that which met the case and fell in with the needs of the age. This mode of considering them also excludes the so-called “psychological” view, which – serving the purpose of envy most effectually – contrives so to refer all actions to the heart – to bring them under such a subjective aspect – as that their authors

appear to have done everything under the impulse of some passion, mean or grand – some *morbid craving* – and on account of these passions and cravings to have been not moral men. Alexander of Macedon partly subdued Greece, and then Asia; therefore he was possessed by a *morbid craving* for conquest. He is alleged to have acted from a craving for fame, for conquest; and the proof that these were the impelling motives is that he did that which resulted in fame. What pedagogue has not demonstrated of Alexander the Great – of Julius Caesar – that they were instigated by such passions, and were consequently immoral men? – whence the conclusion immediately follows that he, the pedagogue, is a better man than they, because he has not such passions; a proof of which lies in the fact that he does not conquer Asia – vanquish Darius and Porus – but while he enjoys life himself, lets others enjoy it too. These psychologists are particularly fond of contemplating those peculiarities of great historical figures which appertain to them as private persons. Man must eat and drink; he sustains relations to friends and acquaintances; he has passing impulses and ebullitions of temper. "No man is a hero to his *valet-de-chambre*" is a well-known proverb; I have added – and Goethe repeated it ten years later – "but not because the former is no hero, but because the latter is a valet." He takes off the hero's boots, assists him to bed, knows that he prefers champagne, etc. Historical personages waited upon in historical literature by such psychological valets, come poorly off; they are brought down by these their attendants to a level with – or rather a few degrees below the level of – the morality of such exquisite discerners of spirits. The Thersites of Homer who abuses the kings is a standing figure for all times. Blows – that is beating with a solid cudgel – he does not get in every age, as in the Homeric one; but his envy, his egotism, is the thorn which he has to carry in his flesh; and the undying worm that gnaws him is the tormenting consideration that his excellent views and vituperations remain absolutely without result in the

world. But our satisfaction at the fate of Thersitism also may have its sinister side.

A World-historical individual is not so unwise as to indulge a variety of wishes to divide his regards. He is devoted to the One Aim, regardless of all else. It is even possible that such men may treat other great, even sacred interests, inconsiderately; conduct which is indeed obnoxious to moral reprehension. But so mighty a form must trample down many an innocent flower – crush to pieces many an object in its path.

The special interest of passion is thus inseparable from the active development of a general principle: for it is from the special and determinate and from its negation, that the Universal results. Particularity contends with its like, and some loss is involved in the issue. It is not the general idea that is implicated in opposition and combat, and that is exposed to danger. It remains in the background, untouched and uninjured. This may be called the *cunning of reason* – that it sets the passions to work for itself, while that which develops its existence through such impulsion pays the penalty, and suffers loss. For it is *phenomenal* being that is so treated, and of this part is of no value, part is positive and real. The particular is for the most part of too trifling value as compared with the general: individuals are sacrificed and abandoned. The Idea pays the penalty of determinate existence and of corruptibility, not from itself, but from the passions of individuals.

But though we might tolerate the idea that individuals, their desires and the gratification of them, are thus sacrificed, and their happiness given up to the empire of chance, to which it belongs; and that as a general rule, individuals come under the category of means to an ulterior end – there is one aspect of human individuality which we should hesitate to regard in that subordinate light, even in relation to the highest; since it is absolutely no subordinate element, but exists in those individuals as inherently eternal and

divine. I mean *morality, ethics, religion.* Even when speaking of the realization of the great ideal aim by means of individuals, the *subjective* element in them – their interest and that of their cravings and impulses, their views and judgments, though exhibited as the merely formal side of their existence – was spoken of as having an infinite right to be consulted. The first idea that presents itself in speaking of *means* is that of something external to the object, and having no share in the object itself. But merely natural things – even the commonest lifeless objects – used as means, must be of such a kind as adapts them to their purpose; they must possess something in common with it. Human beings least of all sustain the bare external relation of mere means to the great ideal aim. Not only do they in the very act of realizing it, make it the occasion of satisfying personal desires, whose purport is diverse from that aim – but they share in that ideal aim itself; and are for that very reason objects of their own existence; not *formally* merely, as the world of living beings generally is – whose individual life is essentially subordinate to that of man, and is properly used *up* as an instrument. Men, on the contrary, are objects of existence to themselves, as regards the intrinsic import of the aim in question. To this order belongs that in them which we would exclude from the category of mere means – Morality, Ethics, Religion. That is to say, man is an object of existence in himself only in virtue of the Divine that is in him – that which was designated at the outset as *Reason;* which, in view of its activity and power of self-determination, was called *Freedom.* And we affirm – without entering at present on the proof of the assertion – that Religion, Morality, etc., have their foundation and source in that principle, and so are essentially elevated above all alien necessity and chance. And here we must remark that individuals, to the extent of their freedom, are responsible for the depravation and enfeeblement of morals and religion. This is the seal of the absolute and sublime destiny of man – that he knows what is good and

what is evil; that his Destiny *is* his very ability to will either good or evil – in one word, that he is the subject of moral imputation, imputation not only of evil, but of good; and not only concerning this or that particular matter, and all that happens *ab extra,* but *also* the good and evil attaching to his individual freedom. The brute alone is simply innocent. It would, however, demand an extensive explanation – as extensive as the analysis of moral freedom itself – to preclude or obviate all the misunderstandings which the statement that what is called innocence imports the entire unconsciousness of evil – is wont to occasion.

In contemplating the fate which virtue, morality, even piety experience in history, we must not fall into the Litany of Lamentations, that the good and pious often – or for the most part – fare ill in the world, while the evil-disposed and wicked prosper. The term *prosperity* is used in a variety of meanings – riches, outward honor, and the like. But in speaking of something which in and for itself constitutes an aim of existence, that so-called well or ill-faring of these or those isolated individuals cannot be regarded as an essential element in the rational order of the universe. With more justice than happiness – or a fortunate environment for individuals – it is demanded of the grand aim of the world's existence, that it should foster, nay involve the execution and ratification of good, moral, righteous purposes. What makes men morally discontented (a discontent, by the bye, on which they somewhat pride themselves), is that they do not find the present adapted to the realization of aims which they hold to be right and just (more especially in modern times, ideals of political constitutions); they contrast unfavorably things as they *are,* with their idea of things as they *ought* to be. In this case it is not private interest nor passion that desires gratification, but Reason, Justice, Liberty; and equipped with this title, the demand in question assumes a lofty bearing, and readily adopts a position not merely of discontent, but of open revolt against the actual condition of

the world. To estimate such a feeling and such views aright, the demands insisted upon, and the very dogmatic opinions asserted, must be examined. At no time so much as in our own, have such general principles and notions been advanced, or with greater assurance. If in days gone by, history seems to present itself as a struggle of passions; in our time – though displays of passion are not wanting – it exhibits partly a predominance of the struggle of notions assuming the authority of principles; partly that of passions and interests essentially subjective, but under the mask of such higher sanctions. The pretensions thus contended for as legitimate in the name of that which has been stated as the ultimate aim of Reason, pass accordingly, for absolute aims – to the same extent as Religion, Morals, Ethics. Nothing, as before remarked, is now more common than the complaint that the *ideals* which imagination sets up are not realized – that these glorious dreams are destroyed by cold actuality. These Ideals – which in the voyage of life founder on the rocks of hard reality – may be in the first instance only subjective, and belong to the idiosyncrasy of the individual, imagining himself the highest and wisest. Such do not properly belong to this category. For the fancies which the individual in his isolation indulges, cannot be the model for universal reality; just as *universal* law is not designed for the units of the mass. These as such may, in fact, find their interests decidedly thrust into the background. But by the term "Ideal," we also understand the ideal of Reason, of the Good, of the True. Poets, as *e.g.,* Schiller, have painted such ideals touchingly and with strong emotion, and with the deeply melancholy conviction that they could not be realized. In affirming, on the contrary, that the Universal Reason *does* realize itself, we have indeed nothing to do with the individual empirically regarded. That admits of degrees of better and worse, since here chance and speciality have received authority from the Idea to exercise their monstrous power. Much, therefore, in particular aspects of the grand phenomenon might be found fault with.

This subjective faultfinding – which, however, only keeps in view the individual and its deficiency, without taking notice of Reason pervading the whole – is easy; and inasmuch as it asserts an excellent intention with regard to the good of the whole, and seems to result from a kindly heart, it feels authorized to give itself airs and assume great consequence. It is easier to discover a deficiency in individuals, in states, and in Providence, than to see their real import and value. For in this merely negative faultfinding a proud position is taken – one which overlooks the object, without having entered into it – without having comprehended its positive aspect. Age generally makes men more tolerant; youth is always discontented. The tolerance of age is the result of the ripeness of a judgment which, not merely as the result of indifference, is satisfied even with what is inferior; but, more deeply taught by the grave experience of life, has been led to perceive the substantial, solid worth of the object in question. The insight then to which – in contradistinction from those ideals – philosophy is to lead us, is, that the real world is as it ought to be – that the truly good – the universal divine reason – is not a mere abstraction, but a vital principle capable of realizing itself. This *Good,* this *Reason,* in its most concrete form, is God. God governs the world; the actual working of his government – the carrying out of his plan – is the History of the World. This plan philosophy strives to comprehend; for only that which has been developed as the result of it, possesses *bonâ fide* reality. That which does not accord with it, is negative, worthless existence. Before the pure light of this divine Idea – which is no mere Ideal – the phantom of a world whose events are an incoherent concourse of fortuitous circumstances, utterly vanishes. Philosophy wishes to discover the substantial purport, the real side, of the divine idea, and to justify the so much despised Reality of things; for Reason is the comprehension of the Divine work. But as to what concerns the perversion, corruption, and ruin of religious, ethical, and moral

purposes, and states of society generally, it must be affirmed that in their *essence* these are infinite and eternal; but that the forms they assume may be of a limited order, and consequently belong to the domain of mere nature, and be subject to the sway of chance. They are therefore perishable, and exposed to decay and corruption. Religion and morality – in the same way as inherently universal essences – have the peculiarity of being present in the individual soul, in the full extent of their Idea, and therefore truly and really; although, they may not manifest themselves in it *in extenso,* and are not applied to fully developed relations. The religion, the morality of a limited sphere of life – that of a shepherd or a peasant, *e.g.,* – in its intensive concentration and limitation to a few perfectly simple relations of life – has infinite worth; the same worth as the religion and morality of extensive knowledge, and of an existence rich in the compass of its relations and actions. This inner focus – this simple region of the claims of subjective freedom – the home of volition, resolution, and action – the abstract sphere of conscience – that which comprises the responsibility and moral value of the individual, remains untouched; and is quite shut out from the noisy din of the World's History – including not merely external and temporal changes, but also those entailed by the absolute necessity inseparable from the realization of the Idea of Freedom itself. But as a general truth this must be regarded as settled, that whatever in the world possesses claims as noble and glorious, has nevertheless a higher existence above it. The claim of the World-Spirit rises above all special claims. These observations may suffice in reference to the means which the World-Spirit uses for realizing its Idea. Stated simply and abstractly, this mediation involves the activity of personal existences in whom Reason is present as their absolute, substantial being; but a basis, in the first instance, still obscure and unknown to them. But the subject becomes more complicated and difficult when we regard individuals not merely in their aspect of activity, but more concretely, in conjunction

with a particular manifestation of that activity in their religion and morality – forms of existence which are intimately connected with Reason, and share in its absolute claims. Here the relation of mere means to an end disappears, and the chief bearings of this seeming difficulty in reference to the absolute aim of Spirit have been briefly considered.

(3) The third point to be analyzed is, therefore – what is the object to be realized by these means; *i.e.* what is the form it assumes in the realm of reality. We have spoken of *means;* but in the carrying out of a subjective, limited aim, we have also to take into consideration the element of a *material,* either already present or which has to be procured. Thus the question would arise: What is the material in which the Ideal of Reason is wrought out? The primary answer would be – Personality itself – human desires – Subjectivity generally. In human knowledge and volition, as its material element, Reason attains positive existence. We have considered subjective volition where it has an object which is the truth and essence of a reality, viz., where it constitutes a great world-historical passion. As a subjective will, occupied with limited passions, it is dependent, and can gratify its desires only within the limits of this dependence. But the subjective will has also a substantial life – a reality – in which it moves in the region of *essential* being, and has the essential itself as the object of its existence. This essential being is the union of the *subjective* with the *rational* Will: it is the moral Whole, the *State,* which is that form of reality in which the individual has and enjoys his freedom; but on the condition of his recognizing, believing in, and willing that which is common to the Whole. And this must not be understood as if the subjective will of the social unit attained its gratification and enjoyment through that common Will; as if this were a means provided for its benefit; as if the individual, in his relations to other individuals, thus limited his freedom, in order that this universal limitation – the mutual constraint of all – might secure a small

space of liberty for each. Rather, we affirm, are Law, Morality, Government, and they alone, the positive reality and completion of Freedom. Freedom of a low and limited order is mere caprice; which finds its exercise in the sphere of particular and limited desires.

Subjective volition – Passion – is that which sets men in activity, that which effects “practical” realization. The Idea is the inner spring of action; the State is the actually existing, realized moral life. For it is the Unity of the universal, essential Will, with that of the individual; and this is “Morality.” The Individual living in this unity has a moral life; possesses a value that consists in this substantiality alone. Sophocles in his Antigone, says, “The divine commands are not of yesterday, nor of today; no, they have an infinite existence, and no one could say whence they came.” The laws of morality are not accidental, but are the essentially Rational. It is the very object of the State that what is essential in the practical activity of men, and in their dispositions, should be duly recognized; that it should have a manifest existence, and maintain its position. It is the absolute interest of Reason that this moral Whole should exist; and herein lie the justification and merit of heroes who have founded states – however rude these may have been. In the history of the World, only those peoples can come under our notice which form a state. For it must be understood that this latter is the realization of Freedom, *i.e.,* of the absolute final aim, and that it exists for its own sake. It must further be understood that all the worth which the human being possesses – all spiritual reality, he possesses only through the State. For his spiritual reality consists in this, that his own essence – Reason – is objectively present to him, that it possesses objective immediate existence for him.

Thus only is he fully conscious; thus only is he a partaker of morality – of a just and moral social and political life. For Truth is the Unity of the universal and subjective Will; and the Universal is to be found in the State,

in its laws, its universal and rational arrangements. The State is the Divine Idea as it exists on Earth. We have in it, therefore, the object of History in a more definite shape than before; that in which Freedom obtains objectivity, and lives in the enjoyment of this objectivity. For Law is the objectivity of Spirit; volition in its true form. Only that will which obeys law, is free: for it obeys itself – it is independent and so free. When the State or our country constitutes a community of existence; when the subjective will of man submits to laws – the contradiction between Liberty and Necessity vanishes. The Rational has necessary existence, as being the reality and substance of things, and we are free in recognizing it as law, and following it as the substance of our own being. The objective and the subjective will are then reconciled, and present one identical homogeneous whole. For the morality *(Sittlichkeif)* of the State is not of that ethical (*moralische*) reflective kind, in which one's own conviction bears sway; this latter is rather the peculiarity of the modern time, while the true antique morality is based on the principle of abiding by one's duty [to the state at large]. An Athenian citizen did what was required of him, as it were from instinct: but if I reflect on the object of my activity, I must have the consciousness that my will has been called into exercise. But morality is Duty – substantial Right – a "*second* nature" as it has been justly called; for the *first* nature of man is his primary merely animal existence.

The development *in extenso* of the Idea of the State belongs to the Philosophy of Jurisprudence; but it must be observed that in the theories of our time various errors are current respecting it, which pass for established truths, and have become fixed prejudices. We will mention only a few of them, giving prominence to such as have a reference to the object of our history.

The error which first meets us is the direct contradictory of our principle that the state presents the realization of Freedom; the opinion, viz., that man

is free by *nature,* but that in *society,* in the State – to which nevertheless he is irresistibly impelled – he must limit this natural freedom. That man is free by Nature is quite correct in one sense; viz., that he is so according to the Idea of Humanity; but we imply thereby that he *is* such only in virtue of his destiny – that he has an undeveloped power to become such; for the "Nature" of an object is exactly synonymous with its "Idea." But the view in question imports more than this. When man is spoken of as "free by Nature," the mode of his existence as well as his destiny *is* implied. His merely natural and primary condition is intended. In this sense a "state of Nature" is assumed in which mankind at large are in the possession of their natural rights with the unconstrained exercise and enjoyment of their freedom. This assumption is not indeed raised to the dignity of the historical fact; it would indeed be difficult, were the attempt seriously made, to point out any such condition as actually existing, or as having ever occurred. Examples of a savage state of life can be pointed out, but they are marked by brutal passions and deeds of violence; while, however rude and simple their conditions, they involve social arrangements which (to use the common phrase) *restrain* freedom. That assumption is one of those nebulous images which theory produces; an idea which it cannot avoid originating, but which it fathers upon real existence, without sufficient historical justification.

What we find such a state of Nature to be in actual experience, answers exactly to the Idea of a *merely* natural condition.

Freedom as the *ideal* of that which is original and natural, does not exist *as original and natural.* Rather must it be first sought out and won; and that by an incalculable medial discipline ' of the intellectual and moral powers. The state of Nature is, therefore, predominantly that of injustice and violence, of untamed natural impulses, of inhuman deeds and feelings. Limitation is certainly produced by Society and the State, but it is a

limitation of the mere brute emotions and rude instincts; as also, in a more advanced stage of culture, of the premeditated self-will of caprice and passion. This kind of constraint is part of the instrumentality by which only, the consciousness of Freedom and the desire for its attainment, in its true – that is Rational and Ideal form – can be obtained. To the Ideal of Freedom, Law and Morality are indispensably requisite; and they are in and for themselves, universal existences, objects and aims; which are discovered only by the activity of thought, separating itself from the merely sensuous, and developing itself, in opposition thereto; and which must on the other hand, be introduced into and incorporated with the originally sensuous will, and that contrarily to its natural inclination. The perpetually recurring misapprehension of Freedom consists in regarding that term only in its *formal,* subjective sense, abstracted from its essential objects and aims; thus a constraint put upon impulse, desire, passion – pertaining to the particular individual as such – a limitation of caprice and self-will is regarded as a fettering of Freedom. We should on the contrary look upon such limitation as the indispensable proviso of emancipation. Society and the State are the very conditions in which Freedom is realized. We must notice a second view, contravening the principle of the development of moral relations into a legal form. The *patriarchal* condition is regarded – either in reference to the entire race of man, or to some branches of it – as exclusively that condition of things, in which the legal element is combined with a due recognition of the moral and emotional parts of our nature; and in which justice as united with these, truly and really influences the intercourse of the social units. The basis of the patriarchal condition is the family relation; which develops the *primary* form of conscious morality, succeeded by that of the State as its *second* phase. The patriarchal condition is one of transition, in which the family has already advanced to the position of a race or people; where the union, therefore, has already ceased to be simply a

bond of love and confidence, and has become one of plighted service. We must first examine the ethical principle of the Family. The Family may be reckoned as virtually a single person; since its members have either mutually surrendered their individual personality, (and consequently their legal position towards each other, with the rest of their particular interests and desires) as in the case of the Parents; or have not yet attained such an independent personality – (the Children – who are primarily in that merely natural condition already mentioned). They live, therefore, in a unity of feeling, love, confidence, and faith in each other. And in a relation of natural love, the one individual has the consciousness of himself in the consciousness of the other; he lives out of self; and in this mutual self-renunciation each regains the life that had been virtually transferred to the other; gains, in fact, that other's existence and his own, as involved with that other. The farther interests connected with the necessities and external concerns of life, as well as the development that has to take place within their circle, *i.e.,* of the children, constitute a common object for the members of the Family. The Spirit of the Family – the Penates – form one substantial being, as much as the Spirit of a People in the State; and morality in both cases consists in a feeling, a consciousness, and a will, not limited to individual personality and interest, but embracing the common interests of the members generally. But this unity is in the case of the Family essentially one of *feeling;* not advancing beyond the limits of the merely *natural.* The piety of the Family relation should be respected in the highest degree by the State; by its means the State obtains as its members individuals who are already moral (for as mere *persons* they are not) and who in uniting to form a state bring with them that sound basis of a political edifice – the capacity of feeling one with a Whole. But the expansion of the Family to a patriarchal unity carries us beyond the ties of blood-relationship – the simply natural elements of that basis; and outside of these limits the

members of the community must enter upon the position of independent personality. A review of the patriarchal condition, *in extenso,* would lead us to give special attention to the Theocratical Constitution. The head of the patriarchal clan is also its priest. If the Family in its general relations, is not yet separated from civic society and the state, the separation of religion from it has also not yet taken place; and so much the less since the piety of the hearth is itself a profoundly subjective state of feeling.

We have considered two aspects of Freedom, – the objective and the subjective; if, therefore, Freedom is asserted to consist in the individuals of a State all agreeing in its arrangements, it *is* evident that only the subjective aspect is regarded. The natural inference from this principle is, that no law can be valid without the approval of all. This difficulty is attempted to be obviated by the decision that the minority must yield to the majority; the majority therefore bear the sway. But long ago J. J. Rousseau remarked that in that case there would be no longer freedom, for the will of the *minority* would cease to be respected. At the Polish Diet each single member had to give his consent before any political step could be taken; and this kind of freedom it was that ruined the State. Besides, it is a dangerous and false prejudice, that the People *alone* have reason and insight, and know what justice is; for each popular faction may represent itself as the People, and the question as to what constitutes the State is one of advanced science, and not of popular decision. If the principle of regard for the individual will is recognized as the only basis of political liberty, viz., that nothing should be done by or for the State to which all the members of the body politic have not given their sanction, we have, properly speaking, no *Constitution.* The only arrangement that would be necessary, would be, first, a centre having no *will* of its own, but which should take into consideration what appeared to be the necessities of the State; and, secondly, a contrivance for calling the members of the State together, for taking the votes, and for performing the

arithmetical operations of reckoning and comparing the number of votes for the different propositions, and thereby deciding upon them. The State is an *abstraction,* having even its generic existence in its citizens; but it is an actuality, and its simply generic existence must embody itself in individual will and activity. The want of government and political administration in general is felt; this necessitates the selection and separation from the rest of those who have to take the helm in political affairs, to decide concerning them, and to give orders to other citizens, with a view to the execution of their plans. If *e.g.,* even the people in a Democracy resolve on a war, a general must head the army. It is only by a Constitution that the *abstraction* – the State – attains life and reality; but this involves the distinction between those who command and those who obey. – Yet obedience seems inconsistent with liberty, and those who command appear to do the very opposite of that which the fundamental idea of the State, viz. that of Freedom, requires. It is, however, urged that – though the distinction between commanding and obeying is absolutely necessary, because affairs could not go on without it – and indeed this seems only a compulsory limitation, external to and even contravening freedom in the abstract – the constitution should be at least so framed, that the citizens may obey as little as possible, and the smallest modicum of free volition be left to the commands of the superiors; – that the substance of that for which subordination is necessary, even in its most important bearings, should be decided and resolved on by the People – by the will of many or of all the citizens; though it is supposed to be thereby provided that the State should be possessed of vigor and strength as a reality – an individual unity. – The primary consideration is, then, the distinction between the governing and the governed, and the political constitutions in the abstract have been rightly divided into Monarchy, Aristocracy, and Democracy; which gives occasion, however, to the remark that Monarchy itself must be further divided into

Despotism and Monarchy proper; that in all the divisions to which the leading Idea gives rise, only the generic character is to be made prominent – it being not intended thereby that the particular category under review should be exhausted as a Form, Order, or Kind in its *concrete* development. But especially it must be observed, that the abovementioned divisions admit of a multitude of particular modifications – not only such as lie within the limits of those classes themselves – but also such as are mixtures of several of these essentially distinct classes, and which are consequently misshapen, unstable, and inconsistent forms. In such a collision, the concerning question is, what is the *best constitution;* that is, by what arrangement, organization, or mechanism of the power of the State its object can be most surely attained. This object may indeed be variously understood; for instance, as the calm enjoyment of life on the part of the citizens, or as Universal Happiness. Such aims have suggested the so-called Ideals of Constitutions, and – as a particular branch of the subject – Ideals of the Education of Princes (Fenelon), or of the governing body – the aristocracy at large (Plato); for the chief point they treat of is the condition of those subjects who stand at the head of affairs: and in these Ideals the concrete details of political organization are not at all considered. The inquiry into the best constitution is frequently treated *as* if not only the theory were an affair of subjective independent conviction, but as if the introduction of a constitution recognized as the best – or *as* superior to others – could be the result of a resolve adopted in this theoretical manner; as if the form of a constitution were a matter of free choice, determined by nothing else but reflection. Of this artless fashion was that deliberation – not indeed of the Persian *people,* but of the Persian *grandees,* who had conspired to overthrow the pseudo-Smerdis and the Magi, after their undertaking had succeeded, and when there was no scion of the royal family living – as to

what constitution they should introduce into Persia; and Herodotus gives an equally naive account of this deliberation.

In the present day, the Constitution of a country and people is not represented as so entirely dependent on free and deliberate choice. The fundamental but abstractly (and therefore imperfectly) entertained conception of Freedom, has resulted in the Republic being very generally regarded – in *theory* – as the only just and true political constitution. Many even, who occupy elevated official positions under monarchical constitutions – so far from being opposed to this idea – are actually its supporters; only they see that such a constitution, though the best, cannot be realized under all circumstances; and that – while men are what they are – we must be satisfied with less if freedom; the monarchical constitution – under the given circumstances, and the present moral condition of the people – being even regarded as the most advantageous. In this view also, the necessity of a particular constitution is made to depend on the condition of the people in such a way *as* if the latter were non-essential and accidental. This representation is founded on the distinction which the reflective understanding makes between an idea and the corresponding reality; holding to an abstract and consequently untrue idea; not grasping it in its completeness, or – which is virtually, though not in point of form, the same – not taking a concrete view of a people and a state. We shall have to show further on that the constitution adopted by a people makes one substance – one spirit: – with its religion, its art and philosophy, or, at least, with its conceptions and thoughts – its culture generally; not to expatiate upon the additional influences, *ab extra,* of climate, of neighbors, of its place in the World. A State is an individual totality, of which you cannot select any particular side, although a supremely important one, such as its political constitution; and deliberate and decide respecting it in that isolated form. Not only is that constitution most intimately connected with and

dependent on those other spiritual forces; but the form of the entire moral and intellectual individuality – comprising all the forces it embodies – is only a step in the development of the grand Whole – with its place pre-appointed in the process; a fact which gives the highest sanction to the constitution in question, and establishes its absolute necessity. – The origin of a state involves imperious lordship on the one hand, instinctive submission on the other. But even obedience – lordly power, and the fear inspired by a ruler – in itself implies some degree of voluntary connection. Even in barbarous states this is the case; it is not the isolated will of individuals that prevails; individual pretensions are relinquished, and the general will is the essential bond of political union. This unity of the general and the particular is the Idea itself, manifesting itself as a *state,* and which subsequently undergoes further development within itself. The abstract yet necessitated process in the development of truly independent states is as follows: – They begin with regal power, whether of patriarchal or military origin. In the next phase, particularity and individuality assert themselves in the form of Aristocracy and Democracy. Lastly, we have the subjection of these separate interests to a single power; but which can be absolutely none other than one outside of which those spheres have an independent position, viz., the Monarchical. Two phases of royalty, therefore, must be distinguished – a primary and a secondary one. This process *is* necessitated, so that the form of government assigned to a particular stage of development *must* present itself: it is therefore no matter of choice, but is that form which is adapted to the spirit of the people.

In a Constitution the main feature of interest is the self-development of the *rational,* that is, the *political* condition of a people; the setting free of the successive elements of the Idea: so that the several powers in the State manifest themselves as separate – attain their appropriate and special perfection – and yet in this independent condition, work together for one

object, and are held together by it – *i.e.,* form an organic whole. The State is thus the embodiment of rational freedom, realizing and recognizing itself in an objective form. For its objectivity consists in this – that its successive stages are not merely ideal, but are present in an appropriate reality; and that in their separate and several working, they are absolutely merged in that agency by which the totality – the soul – the individuate unity – is produced, and of which it is the result.

The State is the Idea of Spirit in the external manifestation of human Will and its Freedom. It is to the State, therefore, that change in the aspect of History indissolubly attaches itself; and the successive phases of the Idea manifest themselves in it as distinct political *principles.* The Constitutions under which World-Historical peoples have reached their culmination, are peculiar to them; and therefore do not present a generally applicable political basis. Were it otherwise, the differences of similar constitutions would consist only in a peculiar method of expanding and developing that generic basis; whereas they really originate in diversity of principle. From the comparison therefore of the political institutions of the ancient World-Historical peoples, it so happens, that for the most recent principle of a Constitution – for the principle of our own times – nothing (so to speak) can be learned. In science and art it is quite otherwise; *e.g.,* the ancient philosophy is so decidedly the basis of the modern, that it is inevitably contained in the latter, and constitutes its basis. In this case the relation is that of a continuous development of the same structure, whose foundation-stone, walls, and roof have remained what they were. In Art, the Greek itself, in its original form, furnishes us the best models. But in regard to political constitution, it is quite otherwise : here the Ancient and the Modern have not their essential principle in common. Abstract definitions and dogmas respecting just government – importing that intelligence and virtue ought to bear sway – are, indeed, common to both. But nothing is so

absurd as to look to Greeks, Romans, or Orientals, for models for the political arrangements of our time. From the East may be derived beautiful pictures of a patriarchal condition, of paternal government, and of devotion to it on the part of peoples; from Greeks and Romans, descriptions of popular liberty. Among the latter we find the idea of a Free Constitution admitting all the citizens to a share in deliberations and resolves respecting the affairs and laws of the Commonwealth. In our times, too, this is its general acceptation; only with this modification, that – since our states are so large, and there are so many of "the Many," the latter – direct action being impossible – should by the indirect method of elective substitution express their concurrence with resolves affecting the common weal; that is, that for legislative purposes generally, the people should be represented by deputies. The so-called Representative Constitution is that form of government with which we connect the idea of a free constitution; and this notion has become a rooted prejudice. On this theory People and Government are separated. But there is a perversity in this antithesis; an ill-intentioned *ruse* designed to insinuate that the People are the totality of the State. Besides, the basis of this view is the principle of isolated individuality – the absolute validity of the subjective will – a dogma which we have already investigated. The great point is, that Freedom in its Ideal conception has not subjective will and caprice for its principle, but the recognition of the universal will; and that the process by which Freedom is realized is the free development of its successive stages. The subjective will is a merely formal determination – a *carte blanche* – not including what it is that is willed. Only the *rational* will is that universal principle which independently determines and unfolds its own being, and develops its successive elemental phases as organic members. Of this Gothic-cathedral architecture the ancients knew nothing. At an earlier stage of the discussion we established the two elemental considerations: first, the *idea* of freedom

as the absolute and final aim; secondly, the *means* for realizing it, *i.e.,* the subjective side of knowledge and will, with its life, movement, and activity. We then recognized the State as the moral Whole and the Reality of Freedom, and consequently as the objective unity of these two elements. For although we make this distinction into two aspects for our consideration, it must be remarked that they are intimately connected; and that their connection is involved in the idea of each when examined separately. We have, on the one hand, recognized the Idea in the definite form of Freedom conscious of and willing itself – having itself alone as its object: involving at the same time, the pure and simple Idea of Reason, and likewise, that which we have called subject – self-consciousness – Spirit actually existing in the World. If, on the other hand, we consider Subjectivity, we find that subjective knowledge and will is Thought. But by the very act of thoughtful cognition and volition, I will the universal object – the substance of absolute Reason. We observe, therefore, an essential union between the objective side – the Idea – and the subjective side – the personality that conceives and wills it. – The *objective* existence of this union is the State, which is therefore the basis and centre of the other concrete elements of the life of a people – of Art, of Law, of Morals, of Religion, of Science. All the activity of Spirit has only this object – the becoming conscious of this union, *i.e.,* of its own Freedom. Among the forms of this conscious union *Religion* occupies the highest position. In it, Spirit – rising above the limitations of temporal and secular existence – becomes conscious of the Absolute Spirit, and in this consciousness of the self-existent Being, renounces its individual interest; it lays this aside in Devotion – a state of mind in which it refuses to occupy itself any longer with the limited and particular. By Sacrifice man expresses his renunciation of his property, his will, his individual feelings. The religious concentration of the soul appears in the form of feeling; it nevertheless passes also into

reflection; a form of worship (*cultus*) is a result of reflection. The second form of the union of the objective and subjective in the human spirit is *Art.* This advances farther into the realm of the actual and sensuous than Religion. In its noblest walk it is occupied with representing, not indeed, the Spirit of God, but certainly the Form of God; and in its secondary aims, that which is divine and spiritual generally. Its office is to render visible the Divine; presenting it to the imaginative and intuitive faculty. But the True is the object not only of conception and feeling, as in Religion – and of intuition, as in Art – but also of the thinking faculty; and this gives us the third form of the union in question – *Philosophy.* This is consequently the highest, freest, and wisest phase. Of course we are not intending to investigate these three phases here; they have only suggested themselves in virtue of their occupying the same general ground as the object here considered – the *State.*

The general principle which manifests itself and becomes an object of consciousness in the State – the form under which all that the State includes is brought – is the whole of that cycle of phenomena which constitutes the *culture* of a nation. But the definite *substance* that receives the form of universality, and exists in that concrete reality which is the State – is the Spirit of the People itself. The actual State is animated by this spirit, in all its particular affairs – its Wars, Institutions, etc. But man must also attain a conscious realization of this his Spirit and essential nature, and of his original identity with it. For we said that morality is the identity of the *subjective* or *personal* with the *universal* will. Now the mind must give itself an express consciousness of this; and the focus of this knowledge is *Religion.* Art and Science are only various aspects and forms of the same substantial being. – In considering Religion, the chief point of inquiry is, whether it recognizes the True – the Idea – only in its separate, abstract form, or in its true unity; in *separation* – God being represented in an

abstract form as the Highest Being, Lord of Heaven and Earth, living in a remote region far from human actualities – or in its *unity* – God, as Unity of the Universal and Individual; the Individual itself assuming the aspect of positive and real existence in the idea of the Incarnation. Religion is the sphere in which a nation gives itself the definition of that which it regards as the True. A definition contains everything that belongs to the essence of an object; reducing its nature to its simple characteristic predicate, as a mirror for every predicate – the generic soul pervading all its details. The conception of God, therefore, constitutes the general basis of a people's character.

In this aspect, religion stands in the closest connection with the political principle. Freedom can exist only where Individuality is recognized as having its positive and real existence in the Divine Being. The connection may be further explained thus: – Secular existence, as merely temporal – occupied with particular interests – is consequently only relative and unauthorized; and receives its validity only in as far as the universal soul that pervades it – its principle – receives absolute validity; which it cannot have unless it is recognized as the definite manifestation, the phenomenal existence of the Divine Essence. On this account it is that the State rests on Religion. We hear this often repeated in our times, though for the most part nothing further is meant than that individual subjects as God-fearing men would be more disposed and ready to perform their duty; since obedience to King and Law so naturally follows in the train of reverence for God. This reverence, indeed, since it exalts the general over the special, may even turn upon the latter – become fanatical – and work with incendiary and destructive violence against the State, its institutions, and arrangements. Religious feeling, therefore, it is thought, should be sober – kept in a certain degree of coolness – that it may not storm against and bear down that which

should be defended and preserved by it. The possibility of such a catastrophe is at least latent in it.

While, however, the correct sentiment is adopted, that the State is based on Religion, the position thus assigned to Religion supposes the State already to exist; and that subsequently, in order to maintain it, Religion must be brought into it – in buckets and bushels as it were – and impressed upon people's hearts. It is quite true that men must be trained to religion, but not as to something whose existence has yet to begin. For in affirming that the State is based on Religion – that it has its roots in it – we virtually assert that the former has proceeded from the latter; and that this derivation is going on now and will always continue; *i.e.,* the principles of the State must be regarded as valid in and for themselves, which can only be in so far as they are recognized as determinate manifestations of the Divine Nature. The form of Religion, therefore, decides that of the State and its constitution. The latter actually originated in the particular religion adopted by the nation; so that, in fact, the Athenian or the Roman State was possible only in connection with the specific form of Heathenism existing among the respective peoples; just as a Catholic State has a spirit and constitution different from that of a Protestant one.

If that outcry – that urging and striving for the implantation of Religion in the community – were an utterance of anguish and a call for help, as it often seems to be, expressing the danger of religion having vanished, or being about to vanish entirely from the State – that would be fearful indeed – worse, in fact, than this outcry supposes; for it implies the belief in a resource against the evil, viz., the implantation and inculcation of religion; whereas religion is by no means a thing to be so produced; its *self-production* (and there can be no other) lies much deeper. Another and opposite folly which we meet with in our time, is that of pretending to invent and carry out political constitutions independently of religion. The

Catholic confession, although sharing the Christian name with the Protestant, does not concede to the State an inherent Justice and Morality – a concession which in the Protestant principle is fundamental. This tearing away of the political morality of the Constitution from its natural connection, is necessary to the genius of that religion, inasmuch as it does not recognize Justice and Morality as independent and substantial. But thus excluded from intrinsic worth – torn away from their last refuge – the sanctuary of conscience – the calm retreat where religion has its abode – the principles and institutions of political legislation are destitute of a real centre, to the same degree as they are compelled to remain abstract and indefinite.

Summing up what has been said of the State, we find that we have been led to call its vital principle, as actuating the individuals who compose it – Morality. The State, its laws, its arrangements, constitute the rights of its members; its natural features, its mountains, air, and waters, are *their* country, their fatherland, their outward material property; the history of this State, *their* deeds; what their ancestors have produced belongs to them and lives in their memory. All is their possession, just as they are possessed by it; for it constitutes their existence, their being. Their imagination is occupied with the ideas thus presented, while the adoption of these laws, and of a fatherland so conditioned is the expression of their will. It is this matured totality which thus constitutes *one* Being, the spirit of *one* People. To it the individual members belong; each unit is the Son of his Nation, and at the same time – in as far as the State to which he belongs is undergoing development – the Son of his Age. None remains behind it, still less advances beyond it. This spiritual Being (the Spirit of his Time) is his; he is a representative of it; it is that in which he originated, and in which he lives. Among the Athenians the word Athens had a double import; suggesting

primarily a complex of political institutions, but no less, in the second place, that Goddess who represented the Spirit of the People and its unity.

This Spirit of a People is a *determinate* and particular Spirit, and is, as just stated, further modified by the degree of its historical development. This Spirit, then, constitutes the basis and substance of those other forms of a nation's consciousness, which have been noticed. For Spirit in its self-consciousness must become an object of contemplation to itself, and objectivity involves, in the first instance, the rise of differences which make up a total of distinct spheres of objective spirit; in the same way as the Soul exists only as the complex of its faculties, which in their form of concentration in a simple unity produce that Soul. It is thus *One Individuality* which, presented in its essence as God, is honored and enjoyed in *Religion*; which is exhibited as an object of sensuous contemplation in *Art*; and is apprehended as an intellectual conception, in *Philosophy.* In virtue of the original identity of their essence, purport, and object, these various forms are inseparably united with the Spirit of the State. Only in connection with this particular religion, can this particular political constitution exist; just as in such or such a State, such or such a Philosophy or order of Art.

The remark next in order is, that each particular National genius is to be treated as only One Individual in the process of Universal History. For that history is the exhibition of the divine, absolute development of Spirit in its highest forms – that gradation by which it attains its truth and consciousness of itself. The forms which these grades of progress assume are the characteristic "National Spirits" of History; the peculiar tenor of their moral life, of their Government, their Art, Religion, and Science. To realize these grades is the boundless impulse of the World-Spirit – the goal of its irresistible urging; for this division into organic members, and the full development of each, is its Idea. – Universal History is exclusively

occupied with showing how Spirit comes to a recognition and adoption of the Truth: the dawn of knowledge appears; it begins to discover salient principles, and at last it arrives at full consciousness. Having, therefore, learned the abstract characteristics of the nature of Spirit, the means which it uses to realize its Idea, and the shape assumed by it in its complete realization in phenomenal existence – namely, the State – nothing further remains for this introductory section to contemplate but III. *The course of the World's History.* – The mutations which history presents have been long characterized in the general, as an advance to something better, more perfect. The changes that take place in Nature – how infinitely manifold soever they may be – exhibit only a perpetually self-repeating cycle; in Nature there happens "nothing new under the sun," and the multiform play of its phenomena so far induces a feeling of *ennui;* only in those changes which take place in the region of Spirit does anything new arise. This peculiarity in the world of mind has indicated in the case of man an altogether different destiny from that of merely natural objects – in which we find always one and the same stable character, to which all change reverts; – namely, a *real* capacity for change, and that for the better – an impulse of *perfectibility.* This principle, which reduces change itself under a law, has met with an unfavorable reception from religions – such as the Catholic – and from States claiming as their just right a stereotyped, or at least a stable position. If the mutability of worldly things in general – political constitutions, for instance – is conceded, either Religion (as the Religion of *Truth*) is absolutely excepted, or the difficulty escaped by ascribing changes, revolutions, and abrogations of immaculate theories and institutions, to accidents or imprudence – but principally to the levity and evil passions of man. The principle of Perfectibility indeed is almost as indefinite a term as mutability in general; it is without scope or goal, and has no standard by which to estimate the changes in question: the improved,

more perfect, state of things towards which it professedly tends is altogether undetermined.

The principle of *Development* involves also the existence of a latent germ of being – a capacity or potentiality striving to realize itself. This formal conception finds actual existence in Spirit; which has the History of the World for its theatre, its possession, and the sphere of its realization. It is not of such a nature as to be tossed to and fro amid the superficial play of accidents, but is rather the absolute arbiter of things; entirely unmoved by contingencies, which, indeed, it applies and manages for its own purposes. Development, however, is also a property of organized natural objects. Their existence presents itself, not as an exclusively dependent one, subjected to external changes, but as one which expands itself in virtue of an internal unchangeable principle; a simple essence – whose existence, *i.e.,* as a germ, is primarily simple – but which subsequently develops a variety of parts, that become involved with other objects, and consequently live through a continuous process of changes; – a process nevertheless, that results in the very contrary of change, and is even transformed into a *vis conservatrix* of the organic principle, and the form embodying it. Thus the organized *individuum* produces itself; it expands itself *actually* to what it was always *potentially.* – So Spirit is only that which it attains by its own efforts; it makes itself *actually* what it always was *potentially.* – That development (of *natural organisms)* takes place in a direct, unopposed, unhindered manner. Between the Idea and its realization – the essential constitution of the original germ and the conformity to it of the existence derived from it – no disturbing influence can intrude. But in relation to Spirit it is quite otherwise. The realization of *its* Idea is mediated by consciousness and will; these very faculties are, in the first instance, sunk in their primary *merely* natural life; the first object and goal of their striving is the realization of their merely natural destiny – but which, since it is Spirit

that animates it, is possessed of vast attractions and displays great power and (moral) richness. Thus Spirit is at war with itself; it has to overcome itself as its most formidable obstacle. That development which in the sphere of Nature is a peaceful growth is, in that of spirit, a severe, a mighty conflict with itself. What Spirit really strives for is the realization of its Ideal being; but in doing so, it hides that goal from its own vision, and is proud and well satisfied in this alienation from it.

Its expansion, therefore, does not present the harmless tranquillity of mere growth, as does that of organic life, but a stern reluctant working against itself. It exhibits, moreover, not the mere formal conception of development, but the attainment of a definite result. The goal of attainment we determined at the outset: it is Spirit in its *Completeness,* in its essential nature, *i.e.,* Freedom. This is the fundamental object, and therefore also the leading principle of the development – that whereby it receives meaning and importance (as in the Roman history, Rome is the object – consequently that which directs our consideration of the facts related); as, conversely, the phenomena of the process have resulted from this principle alone, and only as referred to it, possess a sense of value. There are many considerable periods in History in which this development seems to have been intermitted; in which, we might rather say, the whole enormous gain of previous culture appears to have been entirely lost; after which, unhappily, a new commencement has been necessary, made in the hope of recovering – by the assistance of some remains saved from the wreck of a former civilization, and by dint of a renewed incalculable expenditure of strength and time – one of the regions which had been an ancient possession of that civilization. We behold also *continued* processes of growth; structures and systems of culture in particular spheres, rich in kind, and well developed in every direction. The merely formal and indeterminate view of development in general can neither assign to one form of expansion superiority over the

other, nor render comprehensible the object of that decay of older periods of growth; but must regard such occurrences – or, to speak more particularly, the retrocessions they exhibit – as external contingencies; and can only judge of particular modes of development from indeterminate points of view; which – since the development, as such, is all in all – are relative and not absolute goals of attainment.

Universal History exhibits the *gradation* in the development of that principle whose substantial *purport* is the consciousness of Freedom. The analysis of the successive grades, in their abstract form, belongs to Logic; in their concrete aspect to the Philosophy of Spirit. Here it is sufficient to state that the first step in the process presents that immersion of Spirit in Nature which has been already referred to; the second shows it as advancing to the consciousness of its freedom. But this initial separation from Nature is imperfect and partial, since it is derived immediately from the merely natural state, is consequently related to it, and is still encumbered with it as an essentially connected element. The third step is the elevation of the soul from this still limited and special form of freedom to its pure universal form; that state in which the spiritual essence attains the consciousness and feeling of itself. These grades are the ground-principles of the general process; but how each of them on the other hand involves within *itself* a process of formation – constituting the links in a dialectic of transition – to particularize this must be reserved for the sequel.

Here we have only to indicate that Spirit begins with a germ of infinite possibility, but *only* possibility – containing its substantial existence in an undeveloped form, as the object and goal which it reaches only in its resultant – full reality. In actual existence Progress appears as an advancing from the imperfect to the more perfect; but the former must not be understood abstractly as *only* the imperfect, but as something which involves the very opposite of itself – the so-called perfect – as a *germ* or

impulse. So – reflectively, at least – *possibility* points to something destined to become actual; the Aristotelian dunamis is also *potentia,* power and might. Thus the Imperfect, as involving its opposite, is a contradiction, which certainly exists, but which is continually annulled and solved; the instinctive movement – the inherent impulse in the life of the soul – to break through the rind of mere nature, sensuousness, and that which is alien to it, and to attain to the light of consciousness, *i.e.,* to itself. We have already made the remark how the commencement' of the history of Spirit must be conceived so as to be in harmony with its Idea – in its bearing on the representations that have been made of a primitive "*natural* condition," in which freedom and justice are supposed to exist, or to have existed. This was, however, nothing more than an assumption of historical existence, conceived in the twilight of theorizing reflection. A pretension of quite another order – not a mere inference of reasoning, but making the claim of historical fact, and that supernaturally confirmed – is put forth in connection with a different view that is now widely promulgated by a certain class of speculatists. This view takes up the idea of the primitive paradisiacal conditon of man, which had been previously expanded by the Theologians, after their fashion – involving, *e.g.,* the supposition that God spoke with Adam in Hebrew – but remodelled to suit other requirements. The high authority appealed to in the first instance is the biblical narrative. But this depicts the primitive condition, partly only in the few wellknown traits, but partly either as in man generically – human nature at large – or, so far as Adam is to be taken as an individual, and consequently one person – as existing and completed in *this one,* or *only in one* human pair. The biblical account by no means justifies us in imagining a *people,* and a historical condition of such people, existing in that primitive form; still less does it warrant us in attributing to them the possession of a perfectly developed knowledge of God and Nature. "Nature," so the fiction runs, "like a clear

mirror of God's creation, had originally lain revealed and transparent to the unclouded eye of man." Divine Truth is imagined to have been equally manifest. It is even hinted, though left in some degree of obscurity, that in this primary condition men were in possession of an indefinitely extended and already expanded body of religious truths immediately revealed by God. This theory affirms that all religions had their historical commencement in this primitive knowledge, and that they polluted and obscured the original Truth by the monstrous creations of error and depravity; though in all the mythologies invented by Error, traces of that origin and of those primitive true dogmas are supposed to be present and cognizable. An important interest, therefore, accrues to the investigation of the history of ancient peoples, that, viz., of the endeavor to trace their annals up to the point where such fragments of the primary revelation are to be met with in greater purity than lower down.

We owe to the interest which has occasioned these investigations, very much that is valuable; but this investigation bears direct testimony against itself, for it would seem to be awaiting the issue of an historical demonstration of that which is presupposed by it as historically established. That advanced condition of the knowledge of God, and of other scientific, *e.g.,* astronomical, knowledge (such as has been falsely attributed to the Hindoos); and the assertion that such a condition occurred at the very beginning of History – or that the religions of various nations were traditionally derived from it, and have developed themselves in degeneracy and depravation (as is represented in the rudely-conceived so-called "Emanation System"); – all these are suppositions which neither have, nor – if we may contrast with their arbitrary subjective origin, the true conception of History – can attain historical confirmation. The only consistent and worthy method which philosophical investigation can adopt is to take up History where Rationality begins to manifest itself in the actual conduct of

the World's affairs (not where it is merely an undeveloped potentiality) – where a condition of things is present in which it realizes itself in consciousness, will and action. The inorganic existence of Spirit – that of abstract Freedom – unconscious *torpidity* in respect to good and evil (and consequently to laws), or, if we please to term it so, "blessed ignorance" – is itself not a subject of History. *Natural,* and at the same time *religious* morality, is the piety of the *family.* In this social relation, morality consists in the members behaving towards each other *not as individuals* – possessing an independent will; not as persons. The Family therefore, is excluded from that process of development in which History takes its rise. But when this self-involved spiritual Unity steps beyond this circle of feeling and natural love, and first attains the consciousness of personality, we have that dark, dull centre of indifference, in which neither Nature nor Spirit is open and transparent; and for which Nature and Spirit can become open and transparent only by means of a further process – a very lengthened culture of that Will at length become self-conscious. Consciousness alone is clearness; and is that alone for which God (or any other existence) can be revealed. In its true form – in absolute universality – nothing can be manifested except to consciousness made percipient of it. Freedom is nothing but the recognition and adoption of such universal substantial objects as Right and Law, and the production of a reality that is accordant with them – the State. Nations may have passed a long life before arriving at this their destination, and during this period, they may have attained considerable culture in some directions. This ante-historical period – consistently with what has been said – lies out of our plan; whether a real history followed it, or the peoples in question never attained a political constitution. – It is a great discovery in history – as of a new world – which has been made within rather more than the last twenty years, respecting the Sanscrit and the connection of the European languages with it. In particular,

the connection of the German and Indian peoples has been demonstrated, with as much certainty as such subjects allow of. Even at the present time we know of peoples which scarcely form a society, much less a State, but that have been long known as existing; while with regard to others, which in their advanced condition excite our especial interest, tradition reaches beyond the record of the founding of the State, and they experienced many changes prior to that epoch. In the connection just referred to, between the languages of nations so widely separated, we have a result before us, which proves the diffusion of those nations from Asia as a centre, and the so dissimilar development of what had been originally related, as an incontestable fact; not as an inference deduced by that favorite method of combining, and reasoning from, circumstances grave and trivial, which has already enriched and will continue to enrich history with so many fictions given out as facts. But that apparently so extensive range of events lies beyond the pale of history; in fact preceded it.

In our language the term *History* unites the objective with the subjective side, and denotes quite as much the *historia rerum gestarum,* as the *res gestae* themselves; on the other hand it comprehends not less what has *happened,* than the *narration* of what has happened. This union of the two meanings we must regard as of a higher order than mere outward accident; we must suppose historical narrations to have appeared contemporaneously with historical deeds and events. It is an internal vital principle common to both that produces them synchronously. Family memorials, patriarchal traditions, have an interest confined to the family and the clan. The uniform course of events which such a condition implies, is no subject of serious remembrance; though distinct transactions or turns of fortune, may rouse Mnemosyne to form conceptions of them – in the same way as love and the religious emotions provoke imagination to give shape to a previously formless impulse. But it is the State which first presents subject- matter that

is not only *adapted* to the prose of History, but involves the production of such history in the very progress of its own being. Instead of merely subjective mandates on the part of government – sufficing for the needs of the moment – a community that is acquiring a stable existence, and exalting itself into a State, requires formal commands and laws – comprehensive and universally binding prescriptions; and thus produces a record as well as an interest concerned with intelligent, definite – and, in their results – lasting transactions and occurrences; on which Mnemosyne, for the behoof of the perennial object of the formation and constitution of the State, is impelled to confer perpetuity. Profound sentiments generally, such as that of love, as also religious intuition and its conceptions, are in themselves complete – constantly present and satisfying; but that outward existence of a political constitution which is enshrined in its rational laws and customs, is an *imperfect* Present; and cannot be thoroughly understood without a knowledge of the past. The periods – whether we suppose them to be centuries or millennia – that were passed by nations before history was written among them – and which may have been filled with revolutions, nomadic wanderings, and the strangest mutations – are on that very account destitute of *objective* history, because they present no *subjective* history, no annals. We need not suppose that the records of such periods have accidentally perished; rather, because they were not possible, do we find them wanting. Only in a State cognizant of Laws, can distinct transactions take place, accompanied by such a clear consciousness of them as supplies the ability and suggests the necessity of an enduring record. It strikes every one, in beginning to form an acquaintance with the treasures of Indian literature, that a land so rich in intellectual products, and those of the profoundest order of thought, has no History; and in this respect contrasts most strongly with China – an empire possessing one so remarkable, one going back to the most ancient times. India has not only ancient books

relating to religion, and splendid poetical productions, but also ancient codes; the existence of which latter kind of literature has been mentioned as a condition necessary to the origination of History – and yet History itself is not found. But in that country the impulse of organization, in beginning to develop social distinctions, was immediately petrified in the merely natural classification according to *castes*; so that although the laws concern themselves with civil rights, they make even these dependent on natural distinctions; and are especially occupied with determining the relations (Wrongs rather than Rights) of those classes towards each other, *i.e.*, the privileges of the higher over the lower. Consequently, the element of morality is banished from the pomp of Indian life and from its political institutions. Where that iron bondage of distinctions derived from nature prevails, the connection of society is nothing but wild arbitrariness – transient activity – or rather the play of violent emotion without any goal of advancement or development. Therefore no intelligent reminiscence, no object for Mnemosyne presents itself; and imagination – confused though profound – expatiates in a region, which, to be capable of History, must have had an aim within the domain of Reality, and, at the same time, of substantial Freedom.

Since such are the conditions indispensable to a history, it has happened that the growth of Families to Clans, of Clans to Peoples, and their local diffusion consequent upon this numerical increase – a series of facts which itself suggests so many instances of social complication, war, revolution, and ruin – a process which is so rich in interest, and so comprehensive in extent – has occurred without giving rise to History; moreover, that the extension and organic growth of the empire of articulate sounds has itself remained voiceless and dumb – a stealthy, unnoticed advance. It is a fact revealed by philological monuments, that languages, during a rude condition of the nations that have spoken them, have been very highly

developed; that the human understanding occupied this theoretical region with great ingenuity and completeness. For Grammar, in its extended and consistent form, is the work of thought, which makes its categories distinctly visible therein. It is, moreover, a fact, that with advancing social and political civilization, this systematic completeness of intelligence suffers attrition, and language thereupon becomes poorer and ruder: a singular phenomenon – that the progress towards a more highly intellectual condition, while expanding and cultivating rationality, should disregard that intelligent amplitude and expressiveness – should find it an obstruction and contrive to do without it. Speech is the act of theoretic intelligence in a special sense; it is its *external* manifestation. Exercises of memory and imagination without language, are direct, [non- speculative] manifestations. But this act of theoretic intelligence itself, as also its subsequent development, and the more concrete class of facts connected with it – viz. the spreading of peoples over the earth, their separation from each other, their comminglings and wanderings – remain involved in the obscurity of a voiceless past. They are not acts of Will becoming self- conscious – of Freedom, mirroring itself in a phenomenal form, and creating for itself a proper reality. Not partaking of this element of substantial, veritable existence, those nations – notwithstanding the development of language among them – never advanced to the possession of a *history.* The rapid growth of language, and the progress and dispersion of Nations, assume importance and interest for concrete Reason, only when they have come in contact with States, or begin to form political constitutions themselves.

After these remarks, relating to the form of the *commencement* of the World's History, and to that ante-historical period which must be excluded from it, we have to state the direction of its course: though here only formally. The further definition of the subject in the concrete comes under the head of arrangement. Universal history – as already demonstrated –

shows the development of the consciousness of Freedom on the part of Spirit, and of the consequent realization of that Freedom. This development implies a gradation – a series of increasingly adequate expressions or manifestations of Freedom, which result from its Idea. The logical, and – as still more prominent – the *dialectical* nature of the Idea in general, viz. that it is self-determined – that it assumes successive forms which it successively transcends; and by this very process of transcending its earlier stages gains an affirmative, and, in fact, a richer and more concrete shape; – this necessity of its nature, and the necessary series of pure abstract forms which the Idea successively assumes – is exhibited in the department of *Logic*. Here we need adopt only one of its results, viz. that every step in the process, as differing from any other, has its determinate peculiar principle. In history this principle is idiosyncrasy of Spirit – peculiar National Genius. It is within the limitations of this idiosyncrasy that the spirit of the nation, concretely manifested, expresses every aspect of its consciousness and will – the whole cycle of its realization. Its religion, its polity, its ethics, its legislation, and even its science, art, and mechanical skill, all bear its stamp. These special peculiarities find their key in that common peculiarity – the particular principle that characterizes a people; as, on the other hand, in the facts which History presents in detail, that common characteristic principle may be detected. That such or such a specific quality constitutes the peculiar genius of a people, is the element of our inquiry which must be derived from experience, and historically proved. To accomplish this, presupposes not only a disciplined faculty of abstraction, but an intimate acquaintance with the Idea. The investigator must be familiar *a priori* (if we like to call it so), with the whole circle of conceptions to which the principles in question belong – just as Kepler (to name the most illustrious example in this mode of philosophizing) must have been familiar *a priori* with ellipses, with cubes and squares, and with ideas of their relations,

before he could discover, from the empirical data, those immortal "Laws" of his, which are none other than forms of thought pertaining to those classes of conceptions. He who is unfamiliar with the science that embraces these abstract elementary conceptions, is as little capable – though he may have gazed on the firmament and the motions of the celestial bodies for a lifetime – of *understanding* those Laws, as of *discovering* them. From this want of acquaintance with the ideas that relate to the development of Freedom, proceed a part of those objections which are brought against the philosophical consideration of a science usually regarded as one of mere experience; the so- called *a priori* method, and the attempt to insinuate ideas into the empirical data of history, being the chief points in the indictment. Where this deficiency exists, such conceptions appear alien – not lying within the object of investigation. To minds whose training has been narrow and merely subjective – which have not an acquaintance and familiarity with ideas – they are something strange – not embraced in the notion and conception of the subject which their limited intellect forms. Hence the statement that Philosophy does not understand such sciences. It must, indeed, allow that it has not that kind of Understanding which is the prevailing one in the domain of those sciences, that it does not proceed according to the categories of such Understanding, but according to the categories of *Reason* – though at the same time recognizing that Understanding, and its true value and position. It must be observed that in this very process of scientific *Understanding,* it is of importance that the essential should be distinguished and brought into relief in contrast with the so-called non-essential. But in order to render this possible, we must know what *is essential*; and that is – in view of the History of the World in general – the Consciousness of Freedom, and the phases which this consciousness assumes in developing itself. The bearing of historical facts on this category, is their bearing on the truly Essential. Of the difficulties stated,

and the opposition exhibited to comprehensive conceptions in science, part must be referred to the inability to grasp and understand Ideas. If in Natural History some monstrous hybrid growth is alleged as an objection to the recognition of clear and indubitable classes or species, a sufficient reply is furnished by a sentiment often vaguely urged – that "the exception confirms the rule"; *i.e.*, that is the part of a well-defined rule, to show the conditions in which it applies, or the deficiency or hybridism of cases that are abnormal. Mere Nature is too weak to keep its genera and species pure, when conflicting with alien elementary influences. If, *e.g.,* on considering the human organization in its concrete aspect, we assert that brain, heart, and so forth are essential to its organic life, some miserable abortion may be adduced, which has on the whole the human form, or parts of it – which has been conceived in a human body and has breathed after birth therefrom – in which nevertheless no brain and no heart is found. If such an instance is quoted against the general conception of a human being – the objector persisting in using the name, coupled with a superficial idea respecting it – it can be proved that a real, concrete human being is a truly different object; that such a being must have a brain in its head, and a heart in its breast.

A similar process of reasoning is adopted, in reference to the correct assertion that genius, talent, moral virtues, and sentiments, and piety, may be found in every zone, under all political constitutions and conditions; in confirmation of which examples are forthcoming in abundance. If, in this assertion, the accompanying distinctions are intended to be repudiated as unimportant or non-essential, reflection evidently limits itself to abstract categories; and ignores the specialities of the object in question, which certainly fall under no principle recognized by such categories. That intellectual position which adopts such merely formal points of view, presents a vast field for ingenious questions, erudite views, and striking comparisons; for profound seeming reflections and declamations, which

may be rendered so much the more brilliant in proportion as the subject they refer to is indefinite, and are susceptible of new and varied forms in inverse proportion to the importance of the results that can be gained from them, and the certainty and rationality of their issues. Under such an aspect the well-known Indian Epopees may be compared with the Homeric; perhaps – since it is the vastness of the imagination by which poetical genius proves itself – preferred to them; as, on account of the similarity of single strokes of imagination in the attributes of the divinities, it has been contended that Greek mythological forms may be recognized in those of India. Similarly the Chinese philosophy, as adopting the One [Ton] as its basis, has been alleged to be the same as at a later period appeared as Eleatic philosophy and as the Spinozistic System; while in virtue of its expressing itself also in abstract numbers and lines, Pythagorean and Christian principles have been supposed to be detected in it. Instances of bravery and indomitable courage – traits of magnanimity, of self-denial, and self-sacrifice, which are found among the most savage and the most pusillanimous nations – are regarded as sufficient to support the view that in these nations as much of social virtue and morality may be found as in the most civilized Christian states, or even more. And on this ground a doubt has been suggested whether in the progress of history and of general culture mankind have become better; whether their morality has been increased – morality being regarded in a subjective aspect and view, as founded on what the agent holds to be right and wrong, good and evil; not on a principle which is considered to be in and for itself right and good, or a crime and evil, or on a particular religion believed to be the true one.

We may fairly decline on this occasion the task of tracing the formalism and error of such a view, and establishing the true principles of morality, or rather of social virtue in opposition to false morality. For the History of the World occupies a higher ground than that on which morality has properly its

position; which is personal character – the conscience of individuals – their particular will and mode of action; *these* have a value, imputation, reward or punishment proper to themselves. What the absolute aim of Spirit requires and accomplishes – what Providence does – transcends the obligations, and the liability to imputation and the ascription of good or bad motives, which attach to individuality in virtue of its social relations. They who on moral grounds, and consequently with noble intention, have resisted that which the advance of the Spiritual Idea makes necessary, stand higher in moral worth than those whose crimes have been turned into the means – under the direction of a superior principle – of realizing the purposes of that principle. But in such revolutions both parties generally stand within the limits of the same circle of transient and corruptible existence. Consequently it is only a formal rectitude – deserted by the living Spirit and by God – which those who stand upon ancient right and order maintain. The deeds of great men, who are the Individuals of the World's History, thus appear not only justified in view of that intrinsic result of which they were not conscious, but also from the point of view occupied by the secular moralist. But looked at from this point, moral claims that are irrelevant, must not be brought into collision with world- historical deeds and their accomplishment. The Litany of private virtues – modesty, humility, philanthropy and forbearance – must not be raised against them. The History of the World might, on principle, entirely ignore the circle within which morality and the so much talked of distinction between the moral and the politic lies – not only in abstaining from judgments, for the principles involved, and the necessary reference of the deeds in question to those principles, are a sufficient judgment of them – but in leaving Individuals quite out of view and unmentioned. What it has to record is the activity of the Spirit of Peoples, so that the individual forms which that spirit has assumed in the sphere of outward reality, might be left to the delineation of

special histories. The same kind of formalism avails itself in its peculiar manner of the indefiniteness attaching to genius, poetry, and even philosophy; thinks equally that it finds these everywhere. We have here products of reflective thought; and it is familiarity with those general conceptions which single out and name real distinctions without fathoming the true depth of the matter – that we call Culture. It is something merely formal, inasmuch as it aims at nothing more than the analysis of the subject, whatever it be, into its constituent parts, and the comprehension of these in their logical definitions and forms. It is not the free universality of conception necessary for making an abstract principle the object of consciousness. Such a consciousness of Thought itself, and of its forms isolated from *a* particular object, is Philosophy. This has, indeed, the condition of its existence in culture; that condition being the taking up of the object of thought, and at the same time clothing it with the form of universality, in such a way that the material content and the form given by the intellect are held in an inseparable state; – inseparable to such a degree that the object in question – which, by the analysis of one conception into a multitude of conceptions, is enlarged to an incalculable treasure of thought – is regarded as a merely empirical datum in whose formation thought has had no share. But it is quite as much an act of Thought – of the Understanding in particular – to embrace in one simple conception object which of itself comprehends a concrete and large significance (as Earth, Man – Alexander or Caesar) and to designate it by one word – as to *resolve* such a conception – duly to isolate in idea the conceptions which it contains, and to give them particular names. And in reference to the view which gave occasion to what has just been said, thus much will be clear – that as reflection produces what we include under the general terms Genius, Talent, Art, Science – formal culture on every grade of intellectual development, not only can, but must grow, and attain a mature bloom, while

the grade in question is developing itself to a State, and on this basis of civilization is advancing to intelligent reflection and to general forms of thought – as in laws, so in regard to all else. In the very association of men in a state, lies the necessity of formal culture – consequently of the rise of the sciences and of a cultivated poetry and art generally. The arts designated "plastic," require besides, even in their technical aspect, the civilized association of men. The poetic art – which has less need of external requirements and means, and which has the element of immediate existence, the voice, as its material – steps forth with great boldness and with matured expression, even under the conditions presented by a people not yet united in a political combination; since, as remarked above, language attains on its own particular ground a high intellectual development, prior to the commencement of civilization.

Philosophy also must make its appearance where political life exists; since that in virtue of which any series of phenomena is reduced within the sphere of culture, as above stated, is the Form strictly proper to Thought; and thus for philosophy, which is nothing other than the consciousness of this form itself – the Thinking of Thinking – the material o£ which its edifice is to be constructed, is already prepared by *general* culture. If in the development of the State itself, periods are necessitated which impel the soul of nobler natures to seek refuge from the Present in ideal regions – in order to find in them that harmony with itself which it can no longer enjoy in the discordant real world, where the reflective intelligence attacks all that is holy and deep, which had been spontaneously inwrought into the religion, laws and manners of nations, and brings them down and attenuates them to abstract godless generalities – Thought will be compelled to become Thinking Reason, with the view of effecting in its own element the restoration of its principles from the ruin to which they had been brought.

We find then, it is true, among all world-historical peoples, poetry, plastic art, science, even philosophy; but not only is there a diversity in style and bearing generally, but still more remarkably in subject-matter; and this is a diversity of the most important kind, affecting the rationality of that subject-matter. It is useless for a pretentious aesthetic criticism to demand that our good pleasure should not be made the rule for the matter – the substantial part of their contents – and to maintain that it is the beautiful form as such, the grandeur of the fancy, and so forth, which fine art aims at, and which must be considered and enjoyed by a liberal taste and cultivated mind. A healthy intellect does not tolerate such abstractions, and cannot assimilate productions of the kind above referred to. Granted that the Indian Epopees might be placed on a level with the Homeric, on account of a number of those qualities of form – grandeur of invention and imaginative power, liveliness of images and emotions, and beauty of diction; yet the infinite difference of matter remains; consequently one of substantial importance and involving the interest of Reason, which is immediately concerned with the consciousness of the Idea of Freedom, and its expression in individuals. There is not only a classical *form,* but a classical order of *subject-matter*; and in a work of art form and subject-matter are so closely united that the former can only be classical to the extent to which the latter is so. With a fantastical, indeterminate material – and *Rule* is the essence of *Reason* – the form becomes measureless and formless, or mean and contracted. In the same way, in that comparison of the various systems of philosophy of which we have already spoken, the only point of importance is overlooked, namely, the character of that Unity which is found alike in the Chinese, the Eleatic, and the Spinozistic philosophy – the distinction between the recognition of that Unity as abstract and as concrete – concrete to the extent of being a unity in and by itself – a unity synonymous with Spirit. But that co-ordination proves that it recognizes

only such an abstract unity; so that while it gives judgment respecting philosophy, it is ignorant of that very point which constitutes the interest of philosophy.

But there are also spheres which, amid all the variety that is presented in the substantial content of a particular form of culture, remain the same. The difference above-mentioned in art, science, philosophy, concerns the thinking Reason and Freedom, which is the self-consciousness of the former, and which has the same one root with Thought. As it is not the brute, but only the man that thinks, he only – and only because he is a thinking being – has Freedom. *His* consciousness imports this, that the individual comprehends itself as a *person,* that is, recognizes itself in its single existence as possessing universality – as capable of abstraction from, and of surrendering all speciality; and, therefore, as inherently infinite. Consequently those spheres of intelligence which lie beyond the limits of this consciousness are a common ground among those substantial distinctions. Even morality, which is so intimately connected with the consciousness of freedom, can be very pure while that consciousness is still wanting; as far, that is to say, as it expresses duties and rights only as *objective* commands; or even as far as it remains satisfied with the merely formal elevation of the soul – the surrender of the sensual, and of all sensual motives – in a purely negative, self-denying fashion. The *Chinese* morality – since Europeans have become acquainted with it and with the writings of Confucius – has obtained the greatest praise and proportionate attention from those who are familiar with the Christian morality. There is a similar acknowledgment of the sublimity with which the *Indian* religion and poetry, (a statement that must, however, be limited to the higher kind), but especially the Indian philosophy, expatiate upon and demand the removal and sacrifice of sensuality. Yet both these nations are, it must be confessed, *entirely* wanting in the essential consciousness of the Idea of Freedom. To

the Chinese their moral laws are just like natural laws – external, positive commands – claims established by force – compulsory duties or rules of courtesy towards each other. Freedom, through which alone the essential determinations of Reason become moral sentiments, is wanting. Morality is a political affair, and its laws are administered by officers of government and legal tribunals. Their treatises upon it, (which are not law books, but are certainly addressed to the subjective will and individual disposition) read – as do the moral writings of the Stoics – like a string of commands stated as necessary for realizing the goal of happiness; so that it seems to be left free to men, on their part, to adopt such commands – to observe them or not; while the conception of an abstract subject, "a wise man" [*Sapiens*] forms the culminating point among the Chinese, as also among the Stoic moralists. Also in the Indian doctrine of the renunciation of the sensuality of desires and earthly interests, positive moral freedom is not the object and end, but the annihilation of consciousness – spiritual and even physical privation of life.

It is the concrete spirit of a people which we have distinctly to recognize, and since it is Spirit it can only be comprehended spiritually, that is, by thought. It is this alone which takes the lead in all the deeds and tendencies of that people, and which is occupied in realizing itself – in satisfying its ideal and becoming self-conscious – for its great business is self-production. But for spirit, the highest attainment is self-knowledge; an advance not only to the *intuition,* but to the *thought* – the clear conception of itself. This it must and is also destined to accomplish; but the accomplishment is at the same time its dissolution, and the rise of another spirit, another world-historical people, another epoch of Universal History. This transition and connection lead us to the connection of the whole – the idea of the World's History as such – which we have now to consider more closely, and of which we have to give a representation.

History in general is therefore the development of Spirit in *Time,* as Nature is the development of the Idea in *Space.* If then we cast a glance over the World's-History generally, we see a vast picture of changes and transactions; of infinitely manifold forms of peoples, states, individuals, in unresting succession. Everything that can enter into and interest the soul of man – all our sensibility to *goodness, beauty, and greatness* – is called into play. On every hand aims are adopted and pursued, which we recognize, whose accomplishment we desire – we hope and fear for them. In all these occurrences and changes we behold human action and suffering predominant; everywhere something akin to ourselves, and therefore everywhere something that excites our interest for or against. Sometimes it attracts us by beauty, freedom, and rich variety, sometimes by energy such as enables even vice to make itself interesting. Sometimes we see the more comprehensive mass of some general interest advancing with comparative slowness, and subsequently sacrificed to an infinite complication of trifling circumstances, and so dissipated into atoms. Then, again, with a vast expenditure of power a trivial result is produced; while from what appears unimportant a tremendous issue proceeds. On every hand there is the motliest throng of events drawing us within the circle of its interest, and when one combination vanishes another immediately appears in its place.

The general thought – the category which first presents itself in this restless mutation of individuals and peoples, existing for a time and then vanishing – is that of *change* at large. The sight of the ruins of some ancient sovereignty directly leads us to contemplate this thought of change in its negative aspect. What traveller among the ruins of Carthage, of Palmyra, Persepolis, or Rome, has not been stimulated to reflections on the transiency of kingdoms and men, and to sadness at the thought of a vigorous and rich life now departed – a sadness which does not expend itself on personal losses and the uncertainty of one's own undertakings, but

is a disinterested sorrow at the decay of a splendid and highly cultured national life! But the next consideration which allies itself with that of change, is, that change while it imports dissolution, involves at the same time the rise of a *new life* – that while death is the issue of life, life is also the issue of death. This is a grand conception; one which the Oriental thinkers attained, and which is perhaps the highest in their metaphysics. In the idea of *Metempsychosis* we find it evolved in its relation to individual existence; but a myth more generally known, is that of the *Phoenix* as a type of the Life of *Nature;* eternally preparing for itself its funeral pile, and consuming itself upon it; but so that from its ashes is produced the new, renovated, fresh life. But this image is only Asiatic; oriental not occidental. Spirit – consuming the envelope of its existence – does not merely pass into another envelope, nor rise rejuvenescent from the ashes of its previous form; it comes forth exalted, glorified, a purer spirit. It certainly makes war upon itself – consumes its own existence; but in this very destruction it works up that existence into a new form, and each successive phase becomes in its turn a material, working on which it exalts itself to a new grade.

If we consider Spirit in this aspect – regarding its changes not merely as rejuvenescent transitions, *i.e.,* returns to the same form, but rather as manipulations of itself, by which it multiplies the material for future endeavors – we see it exerting itself in a variety of modes and directions; developing its powers and gratifying its desires in a variety which is inexhaustible; because every one of its creations, in which it has already found gratification, meets it anew as material, and is a new stimulus to plastic activity. The abstract conception of mere change gives place to the thought of Spirit manifesting, developing, and perfecting its powers in every direction which its manifold nature can follow. What powers it inherently possesses we learn from the variety of products and formations

which it originates. In this pleasurable activity, it has to do only with itself. As involved with the conditions of mere nature – internal and external – it will indeed meet in these not only opposition and hindrance, but will often see its endeavors thereby fail; often sink under the complications in which it is entangled either by Nature or by itself. But in such case it perishes in fulfilling its own destiny and proper function, and even thus exhibits the spectacle of self-demonstration as spiritual activity.

The very essence of Spirit is activity; it realizes its potentiality – makes itself its own deed, its own work – and thus it becomes an object to itself; contemplates itself as an objective existence. Thus is it with the Spirit of a people: it is a Spirit having strictly defined characteristics, which erects itself into an objective world, that exists and persists in a particular religious form of worship, customs, constitution, and political laws – in the whole complex of its institutions – in the events and transactions that make up its history. That is its work – that is what this particular Nation *is.* Nations are what their deeds are. Every Englishman will say: We are the men who navigate the ocean, and have the commerce of the world; to whom the East Indies belong and their riches; who have a parliament, juries, etc. – The relation of the individual to that Spirit is that he appropriates to himself this substantial existence; that it becomes his character and capability, enabling him to have a definite place in the world – to be *something.* For he finds the being of the people to which he belongs an already established, firm world – objectively present to him – with which he has to incorporate himself. In this its work, therefore – its world – the Spirit of the people enjoys its existence and finds its satisfaction. – A Nation is moral – virtuous – vigorous – while it is engaged in realizing its grand objects, and defends its work against external violence during the process of giving to its purposes an objective existence. The contradiction between its potential, subjective being – its inner aim and life – and its *actual* being is removed; it has

attained full reality, has itself objectively present to it. But this having been attained, the activity displayed by the Spirit of the people in question is no longer needed; it has its desire. The Nation can still accomplish much in war and peace at home and abroad; but the living substantial soul itself may be said to have ceased its activity. The essential, supreme interest has consequently vanished from its life, for interest is present only where there is opposition. The nation lives the same kind of life as the individual when passing from maturity to old age – in the enjoyment of itself – in the satisfaction of being exactly what it desired and was able to attain. Although its imagination might have transcended that limit, it nevertheless abandoned any such aspirations as objects of *actual endeavor,* if the real world was less than favorable to their attainment – and restricted its aim by the conditions thus imposed. This mere *customary life* (the watch wound up and going on of itself) is that which brings on natural death. Custom is activity without opposition, for which there remains only a formal duration; in which the fulness and zest that originally characterized the aim of life are out of the question – a merely external sensuous existence which has ceased to throw itself enthusiastically into its object. Thus perish individuals, thus perish peoples by a natural death; and though the latter may continue in being, it is an existence without intellect or vitality; having no need of its institutions, because the need for them is satisfied – a political nullity and tedium. In order that a truly universal interest may arise, the Spirit of a People must advance to the adoption of some new purpose; but whence can this new purpose originate? It would be a higher, more comprehensive conception of itself – a transcending of its principle – but this very act would involve a principle of a new order, a new National Spirit.

Such a new principle does in fact enter into the Spirit of a people that has arrived at full development and self-realization; it dies not a simply natural death – for it is not a mere single individual, but a spiritual, generic life; in

its case natural death appears to imply destruction through its own agency. The reason of this difference from the single natural individual, is that the Spirit of a people exists as a *genus,* and consequently carries within it its own negation, in the very generality which characterizes it. A people can only die a violent death when it has become naturally dead in itself, as, *e.g.,* the German Imperial Cities, the German Imperial Constitution.

It is not of the nature of the all-pervading Spirit to die this merely natural death; it does not simply sink into the senile life of mere custom, but – as being a National Spirit belonging to Universal History – attains to the consciousness of what its work is; it attains to a conception of itself. In fact it is world-historical only in so far as a *universal principle* has lain in its fundamental element – in its grand aim: only so far is the work which such a spirit produces, a moral, political organization. If it be mere desires that impel nations to activity, such deeds pass over without leaving a trace; or their traces are only ruin and destruction. Thus, it was first Chronos – Time – that ruled; the Golden Age, without moral products; and what was produced – the offspring of that Chronos – was devoured by it. It was Jupiter – from whose head Minerva sprang, and to whose circle of divinities belong Apollo and the Muses – that first put a constraint upon Time, and set a bound to its principle of decadence. He is the Political god, who produced a moral work – the State.

In the very element of an achievement the quality of generality, of thought, is contained; without thought it has no objectivity; that is its basis. The highest point in the development of a people is this – to have gained a conception of its life and condition – to have reduced its laws, its ideas of justice and morality to a science; for in this unity [of the objective and subjective] lies the most intimate unity that Spirit can attain to in and with itself. In its work it is employed in rendering itself an object of its own

contemplation; but it cannot develop itself objectively in its essential nature, except in *thinking* itself.

At this point, then, Spirit is acquainted with its principles – the general character of its acts. But at the same time, in virtue of its very generality, this work of thought is different in point of form from the actual achievements of the national genius, and from the vital agency by which those achievements have been performed. We have then before us a *real* and an *ideal* existence of the Spirit of the Nation. If we wish to gain the general idea and conception of what the Greeks were, we find it in Sophocles and Aristophanes, in Thucydides and Plato. In these individuals the Greek spirit conceived and thought itself. This is the profounder kind of satisfaction which the Spirit of a people attains; but it is "ideal," and distinct from its "real" activity. At such a time, therefore, we are sure to see a people finding satisfaction in the *idea* of virtue; putting *talk* about virtue partly side by side with actual virtue, but partly in the place of it. On the other hand pure, universal thought, since its nature is universality, is apt to bring the Special and Spontaneous – Belief, Trust, Customary Morality – to reflect upon itself, and its primitive simplicity; to show up the limitation with which it is fettered – partly suggesting reasons for renouncing duties, partly itself *demanding reasons,* and the connection of such requirements with Universal Thought; and not finding that connection, seeking to impeach the authority of duty generally, as destitute of a sound foundation.

At the same time the isolation of individuals from each other and from the Whole makes its appearance; their aggressive selfishness and vanity; their seeking personal advantage and consulting this at the expense of the State at large. That inward principle in transcending its outward manifestations is subjective also in *form* – viz., selfishness and corruption in the unbound passions and egotistic interests of men.

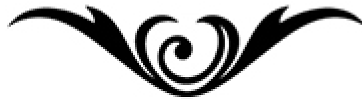
Zeus, therefore, who is represented as having put a limit to the devouring agency of Time, and stayed this transiency by having established something inherently and independently durable – Zeus and his race are themselves swallowed up, and that by the very power that produced them – the principle of thought, perception, reasoning, insight derived from rational grounds, and the requirement of such grounds.

Time is the negative element in the sensuous world. Thought is the same negativity, but it is the deepest, the infinite form of it, in which therefore all existence generally is dissolved; first *finite* existence – *determinate,* limited form: but existence *generally,* in its objective character, is limited; it appears therefore as a mere datum – something immediate – authority; – and is either intrinsically finite and limited, or presents itself as a limit for the thinking subject, and its infinite reflection on itself [unlimited abstraction].

But first we must observe how the life which proceeds from death, is itself, on the other hand, only individual life; so that, regarding the species as the real and substantial in this vicissitude, the perishing of the individual is a regress of the species into individuality. The perpetuation of the race is, therefore, none other than the monotonous repetition of the same kind of existence. Further, we must remark how perception – the comprehension of being by thought – is the source and birthplace of a new, and in fact higher form, in a principle which while it preserves, dignifies its material. For Thought is that *Universal* – that *Species* which is immortal, which preserves identity with itself. The particular form of Spirit not merely passes away in the world by natural causes in Time, but is annulled in the automatic self-mirroring activity of consciousness. Because this annulling is an activity of Thought, it is at the same time conservative and elevating in its operation. While then, on the one side, Spirit annuls the reality, the permanence of that which it *is,* it gains on the other side, the essence, the Thought, the

Universal element of that which *it only was* [its transient conditions]. Its principle is no longer that immediate import and aim which it was previously, but the *essence* of that import and aim.

The result of this process is then that Spirit, in rendering itself objective and making this its being an object of thought, on the one hand destroys the determinate form of its being, on the other hand gains a comprehension of the universal element which it involves, and thereby gives a new form to its inherent principle. In virtue of this, the substantial character of the National Spirit has been altered – that is, its principle has risen into another, and in fact a higher principle.



It is of the highest importance in apprehending and comprehending History to have and to understand the thought involved in this transition. The individual traverses as a unity various grades of development, and remains the same individual; in like manner also does a people, till the Spirit which it embodies reaches the grade of universality. In this point lies the fundamental, the Ideal necessity of transition. This is the soul – the essential consideration – of the philosophical comprehension of History.

Spirit is essentially the result of its own activity: its activity is the transcending of immediate, simple, unreflected existence – the negation of that existence, and the returning into itself. We may compare it with the seed; for with this the plant begins, yet it is also the result of the plant's entire life. But the weak side of life is exhibited in the fact that the commencement and the result are disjoined from each other. Thus also is it in the life of individuals and peoples. The life of a people ripens a certain fruit; its activity aims at the complete manifestation of the principle which it embodies. But this fruit does not fall back into the bosom of the people that produced and matured it; on the contrary, it becomes a poison-draught to it. That poison-draught it cannot let alone, for it has an insatiable thirst for it:

the taste of the draught is its annihilation, though at the same time the rise of a new principle.

We have already discussed the final aim of this progression. The principles of the successive phases of Spirit that animate the Nations in a necessitated gradation, are themselves only steps in the development of the one universal Spirit, which through them elevates and completes itself to a self-comprehending *totality.* While we are thus concerned exclusively with the Idea of Spirit, and in the History of the World regard everything as only its manifestation, we have, in traversing the past – however extensive its periods – only to do with what is *present;* for philosophy, as occupying itself with the True, has to do with the *eternally present.* Nothing in the past is lost for it, for the Idea is ever present; Spirit is immortal; with it there is no past, no future, but an essential *now.* This necessarily implies that the present form of Spirit comprehends within it all earlier steps. These have indeed unfolded themselves in succession independently; but what Spirit is it has always been essentially; distinctions are only the development of this essential nature. The life of the ever present Spirit is a circle of progressive embodiments, which looked at in one aspect still exist beside each other, and only as looked at from another point of view appear as past. The grades which Spirit seems to have left behind it, it still possesses in the depths of its present.

GEOGRAPHICAL BASIS OF HISTORY.

CONTRASTED WITH THE universality of the moral Whole and with the unity of that individuality which is its active principle, the *natural* connection that helps to produce the Spirit of a People, appears an extrinsic element; but inasmuch as we must regard it as the ground on which that Spirit plays its part, it is an *essential* and *necessary* basis. We began with the assertion that, in the History of the World, the Idea of Spirit appears in its actual embodiment as a series of external forms, each one of which declares itself as an actually existing people. This existence falls under the category of Time as well as Space, in the way of natural existence; and the special principle, which every world-historical people embodies, has this principle at the same time as a *natural* characteristic. Spirit, clothing itself in this form of nature, suffers its particular phases to assume separate existence; for mutual exclusion is the mode of existence proper to mere nature. These natural distinctions must be first of all regarded as special possibilities, from which the Spirit of the people in question germinates, and among them is the Geographical Basis. It is not our concern to become acquainted with the land occupied by nations as an external locale, but with the natural type of the locality, as intimately connected with the type and character of the people which is the offspring of such a soil. This character is nothing more nor less than the mode and form in which nations make their appearance in History, and take place and position in it. Nature should not be rated too high nor too low: the mild Ionic sky certainly contributed much to the charm of the Homeric poems, yet this alone can produce no Homers. Nor in fact does it continue to produce them; under Turkish government no bards have arisen. We must first take notice of those natural

conditions which have to be excluded once for all from the drama of the World's History. In the Frigid and in the Torrid zone the locality of World-historical peoples cannot be found. For awakening consciousness takes its rise surrounded by natural influences alone, and every development of it is the reflection of Spirit back upon itself in opposition to the immediate, unreflected character of mere nature. Nature is therefore one element in this antithetic abstracting process; Nature is the first standpoint from which man can gain freedom within himself, and this liberation must not be rendered difficult by natural obstructions. Nature, as contrasted with Spirit, is a quantitative mass, whose power must not be so great as to make its single force omnipotent. In the extreme zones man cannot come to free movement; cold and heat are here too powerful to allow Spirit to build up a world for *itself.* Aristotle said long ago, "When pressing needs are satisfied, man turns to the general and more elevated." But in the extreme zones such pressure may be said never to cease, never to be warded off; men are constantly impelled to direct attention to nature, to the glowing rays of the sun, and the icy frost. The true theatre of History is therefore the temperate zone; or, rather, its northern half, because the earth there presents itself in a continental form, and has a broad breast, as the Greeks say. In the south, on the contrary, it divides itself, and runs out into many points. The same peculiarity shows itself in natural products. The north has many kinds of animals and plants with common characteristics; in the south, where the land divides itself into points, natural forms also present individual features contrasted with each other.

The World is divided into *Old* and *New;* the name of *New* having originated in the fact that America and Australia have only lately become known to us. But these parts of the world are not only relatively new, but intrinsically so in respect of their entire physical and psychical constitution. Their geological antiquity we have nothing to do with. I will not deny the

New World the honor of having emerged from the sea at the world's formation contemporaneously with the old: yet the Archipelago between South America and Asia shows a physical immaturity. The greater part of the islands are so constituted, that they are, as it were, only a superficial deposit of earth over rocks, which shoot up from the fathomless deep, and bear the character of novel origination. New Holland shows a not less immature geographical character; for in penetrating from the settlements of the English farther into the country, we discover immense streams, which have not yet developed themselves to such a degree as to dig a channel for themselves, but lose themselves in marshes. Of America and its grade of civilization, especially in Mexico and Peru, we have information, but it imports nothing more than that this culture was an entirely national one, which must expire as soon as Spirit approached it. America has always shown itself physically and psychically powerless, and still shows itself so. For the aborigines, after the landing of the Europeans in America, gradually vanished at the breath of European activity. In the United States of North America all the citizens are of European descent, with whom the old inhabitants could not amalgamate, but were driven back. The aborigines have certainly adopted some arts and usages from the Europeans, among others that of brandy-drinking, which has operated with deadly effect. In the South the natives were treated with much greater violence, and employed in hard labors to which their strength was by no means competent. A mild and passionless disposition, want of spirit, and a crouching submissiveness towards a Creole, and still more towards a European, are the chief characteristics of the native Americans; and it will be long before the Europeans succeed in producing any independence of feeling in them. The inferiority of these individuals in all respects, even in regard to size, is very manifest; only the quite southern races in Patagonia are more vigorous natures, but still abiding in their natural condition of rudeness and

barbarism. When the Jesuits and the Catholic clergy proposed to accustom the Indians to European culture and manners (they have, as is well known, founded a state in Paraguay and convents in Mexico and California), they commenced a close intimacy with them, and prescribed for them the duties of the day, which, slothful though their disposition was, they complied with under the authority of the Friars. These prescripts (at midnight a bell had to remind them even of their matrimonial duties), were first, and very wisely, directed to the creation of wants – the springs of human activity generally. The weakness of the American physique was a chief reason for bringing the negroes to America, to employ their labor in the work that had to be done in the New World; for the negroes are far more susceptible of European culture than the Indians, and an English traveller has adduced instances of negroes having become competent clergymen, medical men, etc. (a negro first discovered the use of the Peruvian bark), while only a single native was known to him whose intellect was sufficiently developed to enable him to study, but who had died soon after beginning, through excessive brandy-drinking. The weakness of the human physique of America has been aggravated by a deficiency in the mere tools and appliances of progress – the want of *horses* and *iron,* the chief instruments by which they were subdued.

The original nation having vanished or nearly so, the effective population comes for the most part from Europe; and what takes place in America, is but an emanation from Europe. Europe has sent its surplus population to America in much the same way as from the old Imperial Cities, where trade-guilds were dominant and trade was stereotyped, many persons escaped to other towns which were not under such a yoke, and where the burden of imposts was not so heavy. Thus arose, by the side of Hamburg, Altona – by Frankfort, Offenbach – by Nürnburg, Fürth – and Carouge by Geneva. The relation between North America and Europe is

similar. Many Englishmen have settled there, where burdens and imposts do not exist, and where the combination of European appliances and European ingenuity has availed to realize some produce from the extensive and still virgin soil. Indeed the emigration in question offers many advantages. The emigrants have got rid of much that might be obstructive to their interests at home, while they take with them the advantages of European independence of spirit, and acquired skill; while for those who are willing to work vigorously, but who have not found in Europe opportunities for doing so, a sphere of action is certainly presented in America.

America, as is well known, is divided into two parts, connected indeed by an isthmus, but which has not been the means of establishing intercourse between them. Rather, these two divisions are most decidedly distinct from each other. North America shows us on approaching it, along its eastern shore a wide border of level coast, behind which is stretched a chain of mountains – the blue mountains or Appalachians; further north the Alleghanies. Streams issuing from them water the country towards the coast, which affords advantages of the most desirable kind to the United States, whose origin belongs to this region. Behind that mountain-chain the St. Lawrence river flows (in connection with huge lakes), from south to north, and on this river lie the northern colonies of Canada. Farther west we meet the basin of the vast Mississippi, and the basins of the Missouri and Ohio, which it receives, and then debouches into the Gulf of Mexico. On the western side of this region we have in like manner a long mountain chain, running through Mexico and the Isthmus of Panama, and under the names of the Andes or Cordillera, cutting off an edge of coast along the whole west side of South America. The border formed by this is narrower and offers fewer advantages than that of North America. There lie Peru and Chili. On the east side flow eastward the monstrous streams of the Orinoco and Amazons; they form great valleys, not adapted however for cultivation,

since they are only wide desert steppes. Towards the south flows the Rio de la Plata, whose tributaries have their origin partly in the Cordilleras, partly in the northern chain of mountains which separates the basin of the Amazon from its own. To the district of the Rio de la Plata belong Brazil, and the Spanish Republics. Colombia is the northern coast-land of South America, at the west of which, flowing along the Andes, the Magdalena debouches into the Caribbean Sea.

With the exception of Brazil, republics have come to occupy South as well as North America. In comparing South America (reckoning Mexico as part of it) with North America, we observe an astonishing contrast.

In North America we witness a prosperous state of things; an increase of industry and population civil order and firm freedom; the whole federation constitutes but a single state, and has its political centres. In South America, on the contrary, the republics depend only on military force; their whole history is a continued revolution; federated states become disunited; others previously separated become united; and all these changes originate in military revolutions. The more special differences between the two parts of America show us two opposite directions, the one in political respects, the other in regard to religion. South America, where the Spaniards settled and asserted supremacy, is Catholic; North America, although a land of sects of every name, is yet fundamentally, Protestant. A wider distinction is presented in the fact, that South America was conquered, but North America colonized. The Spaniards took possession of South America to govern it, and to become rich through occupying political offices, and by exactions. Depending on a very distant mother country, their desires found a larger scope, and by force, address and confidence they gained a great predominance over the Indians. The North American States were, on the other hand, entirely *colonised,* by Europeans, Since in England Puritans, Episcopalians, and Catholics were engaged in perpetual conflict, and now

one party, now the other, had the upper hand, many emigrated to seek religious freedom on a foreign shore. These were industrious Europeans, who betook themselves to agriculture, tobacco and cotton planting, etc. Soon the whole attention of the inhabitants was given to labor, and the basis of their existence as a united body lay in the necessities that bind man to man, the desire of repose, the establishment of civil rights, security and freedom, and a community arising from the aggregation of individuals as atomic constituents; so that the state was merely something external for the protection of property. From the Protestant religion sprang the principle of the mutual confidence of individuals – trust in the honorable dispositions of other men; for in the Protestant Church the entire life – its activity generally – is the field for what it deems religious works. Among Catholics, on the contrary, the basis of such a confidence cannot exist; for in secular matters only force and voluntary subservience are the principles of action; and the forms which are called Constitutions are in this case only a resort of necessity, and are no protection against mistrust. If we compare North America further with Europe, we shall find in the former the permanent example of a republican constitution. A subjective unity presents itself; for there is a President at the head of the State, who, for the sake of security against any monarchical ambition, is chosen only for four years. Universal protection for property, and a something approaching entire immunity from public burdens, are facts which are constantly held up to commendation. We have in these facts the fundamental character of the community – the endeavor of the individual after acquisition, commercial profit, and gain; the preponderance of *private* interest, devoting itself to that of the community only for its own advantage. We find, certainly, legal relations – a formal code of laws; but respect for law exists apart from genuine probity, and the American merchants commonly lie under the imputation of dishonest dealings under legal protection. If, on the one side, the Protestant

Church develops the essential principle of confidence, as already stated, it thereby involves on the other hand the recognition of the validity of the element of feeling to such a degree as gives encouragement to unseemly varieties of caprice. Those who adopt this standpoint maintain, that, as everyone may have his peculiar way of viewing things *generally,* so he may have also a *religion* peculiar to himself. Thence the splitting up into so many sects, which reach the very acme of absurdity; many of which have a form of worship consisting in convulsive movements, and sometimes in the most sensuous extravagances. This complete freedom of worship is developed to such a degree, that the various congregations choose ministers and dismiss them according to their absolute pleasure; for the Church is no independent existence – having a substantial spiritual being, and correspondingly permanent external arrangement – but the affairs of religion are regulated by the good pleasure for the time being of the members of the community. In North America the most unbounded license of imagination in religious matters prevails, and that religious unity is wanting which has been maintained in European States, where deviations are limited to a few confessions. As to the political condition of North America, the general object of the existence of this State is not yet fixed and determined, and the necessity for a firm combination does not yet exist; for a real State and a real Government arise only after a distinction of classes has arisen, when wealth and poverty become extreme, and when such a condition of things presents itself that a large portion of the people can no longer satisfy its necessities in the way in which it has been accustomed so to do. But America is hitherto exempt from this pressure, for it has the outlet of colonization constantly and widely open, and multitudes are continually streaming into the plains of the Mississippi. By this means the chief source of discontent is removed, and the continuation of the existing civil condition is guaranteed. A comparison of the United States of North

America with European lands is therefore impossible; for in Europe, such a natural outlet for population, notwithstanding all the emigrations that take place, does not exist. Had the woods of Germany been in existence, the French Revolution would not have occurred. North America will be comparable with Europe only after the immeasurable space which that country presents to its inhabitants shall have been occupied, and the members of the political body shall have begun to be pressed back on each other. North America is still in the condition of having land to begin to cultivate. Only when, as in Europe, the direct increase of agriculturists is checked, will the inhabitants, instead of pressing outwards to occupy the fields, press inwards upon each other – pursuing town occupations, and trading with their fellow-citizens; and so form a compact system of civil society, and require an organized state. The North American Federation have no neighboring State (towards which they occupy a relation similar to that of European States to each other), one which they regard with mistrust, and against which they must keep up a standing army. Canada and Mexico are not objects of fear, and England has had fifty years' experience, that *free* America is more profitable to her than it was in a state of *dependence.* The militia of the North American Republic proved themselves quite as brave in the War of Independence as the Dutch under Philip II; but generally, where Independence is not at stake, less power is displayed, and in the year 1814 the militia held out but indifferently against the English.

America is therefore the land of the future, where, in the ages that lie before us, the burden of the World's History shall reveal itself – perhaps in a contest between North and South America. It is a land of desire for all those who are weary of the historical lumber-room of old Europe. Napoleon is reported to have said: "*Cette vieille Europe m'ennuie*." It is for America to abandon the ground on which hitherto the History of the World has developed itself. What *has* taken place in the New World up to the present

time is only an echo of the Old World – the expression of a foreign Life; and as a Land of the Future, it has no interest for us here, for, as regards *History,* our concern must be with that which has been and that which is. In regard to *Philosophy,* on the other hand, we have to do with that which (strictly speaking) is neither past nor future, but with that which *is,* which has an eternal existence – with Reason; and this is quite sufficient to occupy us.

Dismissing, then, the New World, and the dreams to which it may give rise, we pass over to the Old World – the scene of the World's History; and must first direct attention to the natural elements and conditions of existence which it presents. America is divided into two parts, which are indeed connected by an Isthmus, but which forms only an external, material bond of union. The Old World, on the contrary, which lies opposite to America, and is separated from it by the Atlantic Ocean, has its continuity interrupted by a deep inlet – the Mediterranean Sea. The three Continents that compose it have an essential relation to each other, and constitute a totality. Their peculiar feature is that they lie round this Sea, and therefore have an easy means of communication; for rivers and seas are not to be regarded as disjoining, but as uniting. England and Brittany, Norway and Denmark, Sweden and Livonia, have been united. For the three quarters of the globe the Mediterranean Sea is similarly the uniting element, and the centre of World-History. Greece lies here, the focus of light in History. Then in Syria we have Jerusalem, the centre of Judaism and of Christianity; southeast of it lie Mecca and Medina, the cradle of the Mussulman faith; towards the west Delphi and Athens; farther west still, Rome: on the Mediterranean Sea we have also Alexandria and Carthage. The Mediterranean is thus the heart of the Old World, for it is that which conditioned and vitalized it. Without it the History of the World could not be conceived: it would be like ancient Rome or Athens without the forum,

where all the life of the city came together. The extensive tract of eastern Asia is severed from the process of general historical development, and has no share in it; so also Northern Europe, which took part in the World's History only at a later date, and had no part in it while the Old World lasted; for this was exclusively limited to the countries lying round the Mediterranean Sea. Julius Caesar's crossing the Alps – the conquest of Gaul and the relation into which the Germans thereby entered with the Roman Empire – makes consequently an epoch in History; for in virtue of this it begins to extend its boundaries beyond the Alps. Eastern Asia and that trans-Alpine country are the extremes of this agitated focus of human life around the Mediterranean – the beginning and end of History – its rise and decline.

The more special geographical distinctions must now be established, and they are to be regarded as essential, rational distinctions, in contrast with the variety of merely accidental circumstances. Of these characteristic differences there are three: –

(1) The arid elevated land with its extensive steppes and plains.

(2) The valley plains – the Land of Transition permeated and watered by great Streams.

(3) The coast region in immediate connection with the sea.

These three geographical elements are the essential ones, and we shall see each quarter of the globe triply divided accordingly. The first is the substantial, unvarying, metallic, elevated region, intractably shut up within itself, but perhaps adapted to send forth impulses over the rest of the world; the second forms centres of civilization, and is the yet undeveloped independence [of humanity]; the third offers the means of connecting the world together, and of maintaining the connection.

(1) *The elevated land.* – We see such a description of country in middle Asia inhabited by Mongolians (using the word in a general sense): from the

Caspian Sea these Steppes stretch in a northerly direction towards the Black Sea. As similar tracts may be cited the deserts of Arabia and of Barbary in Africa; in South America the country round the Orinoco, and in Paraguay. The peculiarity of the inhabitants of this elevated region, which is watered sometimes only by rain, or by the overflowing of a river (as are the plains of the Orinoco) – is the patriarchal life, the division into single families. The region which these families occupy is unfruitful or productive

Only temporarily: the inhabitants have their property not in the land – from which they derive only a trifling profit – but in the animals that wander with them. For a long time these find pasture in the plains, and when they are depastured, the tribe moves to other parts of the country. They are careless and provide nothing for the winter, on which account therefore, half of the herd is frequently cut off. Among these inhabitants of the upland there exist no legal relations, and consequently there are exhibited among them the extremes of hospitality and rapine; the last more especially when they are surrounded by civilized nations, as the Arabians, who are assisted in their depredations by their horses and camels. The Mongolians feed on mares' milk, and thus the horse supplies them at the same time with appliances for nourishment and for war. Although this is the form of their patriarchal life, it often happens that they cohere together in great masses, and by an impulse of one kind or another, are excited to external movement. Though previously of peaceful disposition, they then rush as a devastating inundation over civilized lands, and the revolution which ensues has no other result than destruction and desolation. Such an agitation was excited among those tribes under Genghis Khan and Tamerlane: they destroyed all before them; then vanished again, as does an overwhelming Forest-torrent – possessing no inherent principle of vitality. From the uplands they rush down into the dells: there dwell peaceful mountaineers – herdsmen who also occupy themselves with agriculture, as

do the Swiss. Asia has also such a people: they are however on the whole a less important element.

(2) *The valley plains.* – These are plains, permeated by rivers, and which owe the whole of their fertility to the streams by which they are formed. Such a Valley-Plain is China – India, traversed by the Indus and the Ganges – Babylonia, where the Euphrates and the Tigris flow – Egypt, watered by the Nile. In these regions extensive Kingdoms arise, and the foundation of great States begins. For agriculture, which prevails here as the primary principle of subsistence for individuals, is assisted by the regularity of seasons, which require corresponding agricultural operations; property in land commences, and the consequent legal relations; – that is to say, the basis and foundation of the State, which becomes possible only in connection with such relations.

(3) *The coast land.* – A River divides districts of country from each other, but still more does the sea; and we are accustomed to regard water as the separating element. Especially in recent times has it been insisted upon that States must necessarily have been separated by natural features. Yet on the contrary, it may be asserted as a fundamental principle that nothing *unites* so much as water, for countries are nothing else than districts occupied by streams. Silesia, for instance, is the valley of the Oder; Bohemia and Saxony are the valley of the Elbe; Egypt is the valley of the Nile. With the sea this is not less the case, as has been already pointed out. Only Mountains separate. Thus the Pyrenees decidedly separate Spain from France. The Europeans have been in constant connection with America and the East Indies ever since they were discovered; but they have scarcely penetrated into the interior of Africa and Asia, because intercourse by land is much more difficult than by water. Only through the fact of being a sea, has the Mediterranean become a focus of national life. Let us now look at the character of the nations that are conditioned by this third element.

The sea gives us the idea of the indefinite, the unlimited, and infinite; and in *feeling his own infinite* in that Infinite, man is stimulated and emboldened to stretch beyond the limited: the sea invites man to conquest, and to piratical plunder, but also to honest gain and to commerce. The land, the mere Valley-plain attaches him to the soil; it involves him in an infinite multitude of dependencies, but the sea carries him out beyond these limited circles of thought and action. Those who navigate the sea, have indeed gain for their object, but the means are in this respect paradoxical, inasmuch as they hazard both property and life to attain it. The means therefore are the very opposite to that which they aim at. This is what exalts their gain and occupation above itself, and makes it something brave and noble. Courage is necessarily introduced into trade, daring is joined with wisdom. For the daring which encounters the sea must at the same time embrace wariness – cunning – since it has to do with the treacherous, the most unreliable and deceitful element. This boundless plain is absolutely yielding – withstanding no pressure, not even a breath of wind. It looks boundlessly innocent, submissive, friendly, and insinuating; and it is exactly this submissiveness which changes the sea into the most dangerous and violent element. To this deceitfulness and violence man opposes merely a simple piece of wood; confides entirely in his courage and presence of mind; and thus passes from a firm ground to an unstable support, taking his artificial ground with him. The Ship – that swan of the sea, which cuts the watery plain in agile and arching movements or describes circles upon it – is a machine whose invention does the greatest honor to the boldness of man as well as to his understanding. This stretching out of the sea beyond the limitations of the land, is wanting to the splendid political edifices of Asiatic States, although they themselves border on the sea – as for example, China. For them the sea is only the limit, the ceasing of the land; they have no positive relation to it. The activity to which the sea invites, is a quite

peculiar one: thence arises the fact that the coast-lands almost always separate themselves from the states of the interior although they are connected with these by a river. Thus Holland has severed itself from Germany, Portugal from Spain.

In accordance with these data we may now consider the three portions of the globe with which History is concerned, and here the three characteristic principles manifest themselves in a more or less striking manner: Africa has for its leading classical feature the Upland, Asia the contrast of river regions with the Upland, Europe the mingling of these several elements. *Africa* must be divided into three parts: one is that which lies south of the desert of Sahara – Africa proper – the Upland almost entirely unknown to us, with narrow coast-tracts along the sea; the second is that to the north of the desert – European Africa (if we may so call it) – a coastland; the third is the river region of the Nile, the only valley-land of Africa, and which is in connection with Asia.

Africa proper, as far as History goes back, has remained – for all purposes of connection with the rest of the World – shut up; it is the Gold-land compressed within itself – the land of childhood, which lying beyond the day of self-conscious history, is enveloped in the dark mantle of Night. Its isolated character originates, not merely in its tropical nature, but essentially in its geographical condition. The triangle which it forms (if we take the West Coast – which in the Gulf of Guinea makes a strongly indented angle – for one side, and in the same way the East Coast to Cape Gardafu for another) is on two sides so constituted for the most part, as to have a very narrow Coast Tract, habitable only in a few isolated spots. Next to this towards the interior, follows to almost the same extent, a girdle of marsh land with the most luxuriant vegetation, the especial home of ravenous beasts, snakes of all kinds – a border tract whose atmosphere is poisonous to Europeans. This border constitutes the base of a cincture of

high mountains, which are only at distant intervals traversed by streams, and where they are so, in such a way as to form no means of union with the interior; for the interruption occurs but seldom below the upper part of the mountain ranges, and only in individual narrow channels, where are frequently found innavigable waterfalls and torrents crossing each other in wild confusion. During the three or three and a half centuries that the Europeans have known this border-land and have taken places in it into their possession, they have only here and there (and that but for a short time) passed these mountains, and have nowhere settled down beyond them. The land surrounded by these mountains is an unknown Upland, from which on the other hand the Negroes have seldom made their way through. In the sixteenth century occurred at many very distant points, outbreaks of terrible hordes which rushed down upon the more peaceful inhabitants of the declivities. Whether any internal movement had taken place, or if so, of what character, we do not know. What we do know of these hordes, is the contrast between their conduct in their wars and forays themselves – which exhibited the most reckless inhumanity and disgusting barbarism – and the fact that afterwards, when their rage was spent, in the calm time of peace, they showed themselves mild and well disposed towards the Europeans, when they became acquainted with them. This holds good of the Fullahs and of the Mandingo tribes, who inhabit the mountain terraces of the Senegal and Gambia. The second portion of Africa is the river district of the Nile – Egypt; which was adapted to become a mighty centre of independent civilization, and therefore is as isolated and singular in Africa as Africa itself appears in relation to the other parts of the world. The northern part of Africa, which may be specially called that of the *coast- territory* (for Egypt has been frequently driven back on itself, by the Mediterranean) lies on the Mediterranean and the Atlantic; a magnificent territory, on which Carthage once lay – the site of the modern Morocco, Algiers, Tunis, and Tripoli. This

part was to be – *must* be attached to Europe: the French have lately made a successful effort in this direction: like Hither- Asia, it looks Europe-wards. Here in their turn have Carthaginians, Romans, and Byzantines, Mussulmans, Arabians, had their abode, and the interests of Europe have always striven to get a footing in it.

The peculiarly African character is difficult to comprehend, for the very reason that in reference to it, we must quite give up the principle which naturally accompanies all *our* ideas – the category of Universality. In Negro life the characteristic point is the fact that consciousness has not yet attained to the realization of any substantial objective existence – as for example, God, or Law – in which the interest of man's volition is involved and in which he realizes his own being. This distinction between himself as an individual and the universality of his essential being, the African in the uniform, undeveloped oneness of his existence has not yet attained; so that the Knowledge of an absolute Being, an Other and a Higher than his individual self, is entirely wanting. The Negro, as already observed, exhibits the natural man in his completely wild and untamed state. We must lay aside all thought of reverence and morality – all that we call feeling – if we would rightly comprehend him; there is nothing harmonious with humanity to be found in this type of character. The copious and circumstantial accounts of Missionaries completely confirm this, and Mahommedanism appears to be the only thing which in any way brings the Negroes within the range of culture. The Ma-hommedans too understand better than the Europeans, how to penetrate into the interior of the country. The grade of culture which the Negroes occupy may be more nearly appreciated by considering the aspect which *Religion* presents among them. That which forms the basis of religious conceptions is the consciousness on the part of man of a Higher Power – even though this is conceived only as a *vis natures* – in relation to which he feels himself a weaker, humbler being. Religion

begins with the consciousness that there is something higher than man. But even Herodotus called the Negroes sorcerers: – now in *Sorcery* we have not the idea of a God, of a moral faith; it exhibits man as the highest power, regarding him as alone occupying a position of command over the power of Nature. We have here therefore nothing to do with a spiritual adoration of God, nor with an empire of Right. God thunders, but is not on that account recognized as God. For the soul of man, God must be more than a thunderer, whereas among the Negroes this is not the case. Although they are necessarily conscious of dependence upon nature – for they need the beneficial influence of storm, rain, cessation of the rainy period, and so on – yet this does not conduct them to the consciousness of a Higher Power: it is they who command the elements, and this they call "magic." The Kings have a class of ministers through whom they command elemental changes, and every place possesses such magicians, who perform special ceremonies, with all sorts of gesticulations, dances, uproar, and shouting, and in the midst of this confusion commence their incantations. The second element in their religion, consists in their giving an outward form to this supernatural power – projecting their hidden might into the world of phenomena by means of images. What they conceive of as the power in question, is therefore nothing really objective, having a substantial being and different from themselves, but the first thing that comes in their way. This, taken quite indiscriminately, they exalt to the dignity of a "Genius"; it may be an animal, a tree, a stone, or a wooden figure. This is their *Fetich* – a word to which the Portuguese first gave currency, and which is derived from *feitizo,* magic. Here, in the Fetich, a kind of objective independence as contrasted with the arbitrary fancy of the individual seems to manifest itself; but as the objectivity is nothing other than the fancy of the individual projecting itself into space, the human individuality remains master of the image it has adopted. If any mischance occurs which the Fetich has not averted, if rain is

suspended, if there is a failure in the crops, they bind and beat or destroy the Fetich and so get rid of it, making another immediately, and thus holding it in their own power. Such a Fetich has no independence as an object of religious worship; still less has it aesthetic independence as a work of art; it is merely a creation that expresses the arbitrary choice of its maker, and which always remains in his hands. In short there is no relation of dependence in this religion. There is however one feature that points to something beyond; – the *Worship of the Dead* – in which their deceased forefathers and ancestors are regarded by them as a power influencing the living. Their idea in the matter is that these ancestors exercise vengeance and inflict upon man various injuries – exactly in the sense in which this was supposed of witches in the Middle Ages. Yet the power of the dead is not held superior to that of the living, for the Negroes command the dead and lay spells upon them. Thus the power in question remains substantially always in bondage to the living subject. Death itself is looked upon by the Negroes as no universal natural law; even this, they think, proceeds from evil-disposed magicians. In this doctrine is certainly involved the elevation of man over Nature; to such a degree that the chance volition of man is superior to the merely natural – that he looks upon this as an instrument to which he does not pay the compliment of treating it in a way conditioned by itself, but which he commands.

But from the fact that man is regarded as the Highest, it follows that he has no respect for himself; for only with the consciousness of a Higher Being does he reach a point of view which inspires him with real reverence. For if arbitrary choice is the absolute, the only substantial objectivity that is realized, the mind cannot in such be conscious of any Universality. The Negroes indulge, therefore, that perfect *contempt* for humanity, which in its bearing on Justice and Morality is the fundamental characteristic of the race. They have moreover no knowledge of the immortality of the soul,

although spectres are supposed to appear. The undervaluing of humanity among them reaches an incredible degree of intensity. Tyranny is regarded as no wrong, and cannibalism *is* looked upon as quite customary and proper. Among us instinct deters from it, if we can speak of instinct at all as appertaining to man. But with the Negro this is not the case, and the devouring of human flesh is altogether consonant with the general principles of the African race; to the sensual Negro, human flesh is but an object of sense – mere flesh. At the death of a King hundreds are killed and eaten; prisoners are butchered and their flesh sold in the markets; the victor is accustomed to eat the heart of his slain foe. When magical rites are performed, it frequently happens that the sorcerer kills the first that comes in his way and divides his body among the bystanders. Another characteristic fact in reference to the Negroes is Slavery. Negroes are enslaved by Europeans and sold to America. Bad as this may be, their lot in their own land is even worse, since there a slavery quite as absolute exists; for it is the essential principle of slavery, that man has not yet attained a consciousness of his freedom, and consequently sinks down to a mere Thing – an object of no value. Among the Negroes moral sentiments are quite weak, or more strictly speaking, non-existent. Parents sell their children, and conversely children their parents, as either has the opportunity. Through the pervading influence of slavery all those bonds of moral regard which we cherish towards each other disappear, and it does not occur to the Negro mind to expect from others what we are enabled to claim. The polygamy of the Negroes has frequently for its object the having many children, to be sold, every one of them, into slavery; and very often naive complaints on this score are heard, as for instance in the case of a Negro in London, who lamented that he was now quite a poor man because he had already sold all his relations. In the contempt of humanity displayed by the Negroes, it is not so much a despising of death as a want of regard

for life that forms the characteristic feature. To this want of regard for life must be ascribed the great courage, supported by enormous bodily strength, exhibited by the Negroes, who allow themselves to be shot down by thousands in war with Europeans. Life has a value only when it has something valuable as its object.

Turning our attention in the next place to the category of *political constitution,* we shall see that the entire nature of this race is such as to preclude the existence of any such arrangement. The standpoint of humanity at this grade is mere sensuous volition with energy of will; since universal spiritual laws (for example, that of the morality of the Family) cannot be recognized here. Universality exists only as arbitrary subjective choice. The political bond can therefore not possess such a character as that free laws should unite the community. There is absolutely no bond, no restraint upon that arbitrary volition. Nothing but external force can hold the State together for a moment. A ruler stands at the head, for sensuous barbarism can only be restrained by despotic power. But since the subjects are of equally violent temper with their master, they keep him on the other hand within limits. Under the chief there are many other chiefs with whom the former, whom we will call the King, takes counsel, and whose consent he must seek to gain, if he wishes to undertake a war or impose a tax. In this relation he can exercise more or less authority, and by fraud or force can on occasion put this or that chieftain out of the way. Besides this the Kings have other specified prerogatives. Among the Ashantees the King inherits all the property left by his subjects at their death. In other places all unmarried women belong to the King, and whoever wishes a wife, must buy her from him. If the Negroes are discontented with their King they depose and kill him. In Dahomey, when they are thus displeased, the custom is to send parrots' eggs to the King, as a sign of dissatisfaction with his government. Sometimes also a deputation is sent, which intimates to him,

that the burden of government must have been very troublesome to him, and that he had better rest a little. The King then thanks his subjects, goes into his apartments, and has himself strangled by the women. Tradition alleges that in former times a state composed of women made itself famous by its conquests: it was a state at whose head was a woman. She is said to have pounded her own son in a mortar, to have besmeared herself with the blood, and to have had the blood of pounded children constantly at hand. She is said to have driven away or put to death all the males, and commanded the death of all male children. These furies destroyed everything in the neighborhood, and were driven to constant plunderings, because they did not cultivate the land. Captives in war were taken as husbands: pregnant women had to betake themselves outside the encampment; and if they had born a son, put him out of the way. This infamous state, the report goes on to say, subsequently disappeared. Accompanying the King we constantly find in Negro States, the executioner, whose office is regarded as of the highest consideration, and by whose hands, the King, though he makes use of him for putting suspected persons to death, may himself suffer death, if the grandees desire it. Fanaticism, which, notwithstanding the yielding disposition of the Negro in other respects, can be excited, surpasses, when roused, all belief. An English traveller states that when a war is determined on in Ashantee, solemn ceremonies precede it: among other things the bones of the King's mother are laved with human blood. As a prelude to the war, the King ordains an onslaught upon his own metropolis, as if to excite the due degree of frenzy. The King sent word to the English Hutchinson: 'Christian, take care, and watch well over your family. The messenger of death has drawn his sword and will strike the neck of many Ashantees; when the drum sounds it is the death signal for multitudes. Come to the King, if you can, and fear nothing for yourself." The drum beat, and a terrible carnage was

begun; all who came in the way of the frenzied Negroes in the streets were stabbed. On such occasions the King has all whom he suspects killed, and the deed then assumes the character of a sacred act. Every idea thrown into the mind of the Negro is caught up and realized with the whole energy of his will; but this realization involves a wholesale destruction. These people continue long at rest, but suddenly their passions ferment, and then they are quite beside themselves. The destruction which is the consequence of their excitement, is caused by the fact that it is no positive idea, no thought which produces these commotions; – a physical rather than a spiritual enthusiasm. In Dahomey, when the King dies, the bonds of society are loosed; in his palace begins indiscriminate havoc and disorganization. All the wives of the King (in Dahomey their number is exactly 3,333) are massacred, and through the whole town plunder and carnage run riot. The wives of the King regard this their death as a necessity; they go richly attired to meet it. The authorities have to hasten to proclaim the new governor, simply to put a stop to massacre.

From these various traits it is manifest that want of self-control distinguishes the character of the Negroes. This condition is capable of no development or culture, and as we see them at this day, such have they always been. The only essential connection that has existed and continued between the Negroes and the Europeans is that of slavery. In this the Negroes see nothing unbecoming them, and the English who have done most for abolishing the slave-trade and slavery, are treated by the Negroes themselves as enemies. For it is a point of first importance with the Kings to sell their captured enemies, or even their own subjects; and viewed in the light of such facts, we may conclude *slavery* to have been the occasion of the increase of human feeling among the Negroes. The doctrine which we deduce from this condition of slavery among the Negroes, and which constitutes the only side of the question that has an interest for our inquiry,

is that which we deduce from the Idea: viz., that the "Natural condition" itself is one of absolute and thorough injustice – contravention of the Right and Just. Every intermediate grade between this and the realization of a rational State retains – as might be expected – elements and aspects of injustice; therefore we find slavery even in the Greek and Roman States, as we do serfdom down to the latest times. But thus existing in a State, slavery is itself a phase of advance from the merely isolated sensual existence – a phase of education – a mode of becoming participant in a higher morality and the culture connected with it. Slavery is in and for itself *injustice,* for the essence of humanity is *Freedom*; but for this man must be matured. The gradual abolition of slavery is therefore wiser and more equitable than its sudden removal.

At this point we leave Africa, not to mention it again. For it is no historical part of the World; it has no movement or development to exhibit. Historical movements in it – that is in its northern part – belong to the Asiatic or European World. Carthage displayed there an important transitionary phase of civilization; but, as a Phoenician colony, it belongs to Asia. Egypt will be considered in reference to the passage of the human mind from its Eastern to its Western phase, but it does not belong to the African Spirit. What we properly understand by Africa, is the Unhistorical, Undeveloped Spirit, still involved in the conditions of mere nature, and which had to be presented here only as on the threshold of the World's History. Having eliminated this introductory element, we find ourselves for the first time on the real theatre of History. It now only remains for us to give a prefatory sketch of the Geographical basis of the Asiatic and European world. *Asia* is, characteristically, the *Orient* quarter of the globe – the region of origination. It is indeed a Western world for America; but as Europe presents on the whole, the centre and end of the old world, and is absolutely the *West – so* Asia is absolutely the *East.*

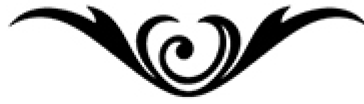
In Asia arose the Light of Spirit, and therefore the history of the World.

We must now consider the various localities of Asia. Its physical constitution presents direct antitheses, and the essential relation of these antitheses. Its various geographical principles are formations in themselves developed and perfected. First, the northern slope, Siberia, must be eliminated. This slope, from the Altai chain, with its fine streams, that pour their waters into the northern Ocean, does not at all concern us here; because the Northern Zone, as already stated, lies out of the pale of History. But the remainder includes three very interesting localities. The first is, as in Africa, a massive Upland, with a mountain girdle which contains the highest summits in the World. This Upland is bounded on the South and Southeast, by the Mus-Tag or Imaus, parallel to which, farther south, runs the Himalaya chain. Towards the East, a mountain chain running from South to North, parts off the basin of the Amur. On the North lie the Altai and Songarian mountains; in connection with the latter, in the Northwest the Musart and in the West the Belur Tag, which by the Hindoo Coosh chain are again united with the Mus-Tag.

This high mountain-girdle is broken through by streams, which are dammed up and form great valley plains. These, more or less inundated, present centres of excessive luxuriance and fertility, and are distinguished from the European river districts in their not forming, as those do, proper valleys with valleys branching out from them, but river-plains. Of this kind are – the Chinese Valley Plain, formed by the Hoang-Ho and Yang-tse-Kiang (the yellow and blue streams) – next that of India, formed by the Ganges; – less important is the Indus, which in the north, gives character to the Punjaub, and in the south flows through plains of sand. Farther on, the lands of the Tigris and Euphrates, which rise in Armenia and hold their course along the Persian mountains. The Caspian sea has similar river valleys; in the East those formed by the Oxus and Jaxartes (Gihon and

Sihon) which pour their waters into the Sea of Aral; on the West those of the Cyrus and Araxes (Kur and Aras). – The Upland and the Plains must be distinguished from each other; the third element is their intermixture, which occurs in Hither [Anterior] Asia. To this belongs Arabia, the land of the Desert, the upland of plains, the empire of fanaticism. To this belong Syria and Asia Minor, connected with the sea, and having constant intercourse with Europe.

In regard to Asia the remark above offered respecting geographical differences is especially true; viz., that the rearing of cattle is the business of the Upland – agriculture and industrial pursuits that of the valley-plains – while commerce and navigation form the third and last item. Patriarchal independence is strictly bound up with the first condition of society; property and the relation of lord and serf with the second; civil freedom with the third. In the Upland, where the various kinds of cattle breeding, the rearing of horses, camels, and sheep, (not so much of oxen) deserve attention, we must also distinguish the calm *habitual* life of nomad tribes from the wild and restless character they display in their conquests. These people, without developing themselves in a really historical form, are swayed by a powerful impulse leading them to change their aspect as nations; and although *they* have not attained an historical character, the beginning of History may be traced to them. It must however be allowed that the peoples of the plains are more interesting. In agriculture itself is involved, *ipso facto,* the cessation of a roving life. It demands foresight and solicitude for the future: reflection on a general idea is thus awakened; and herein lies the principle of property and productive industry. China, India, Babylonia, have risen to the position of cultivated lands of this kind. But as the peoples that have occupied these lands have been shut up within themselves, and have not appropriated that element of civilization which the sea supplies, (or at any rate only at the commencement of their civilization)



and as their navigation of it – to whatever extent it may have taken place – remained without influence on their culture – a relation to the rest of History could only exist in their case, through their being sought out, and their character investigated by others. The mountain-girdle of the upland, the upland itself, and the river-plains, characterize Asia physically and spiritually : but they themselves are not concretely, really, historical elements. The opposition between the extremes is simply recognized, not harmonized; a firm settlement in the fertile plains is for the mobile, restless, roving, condition of the mountain and Upland races, nothing more than a constant object of endeavor. Physical features distinct in the sphere of nature, assume an essential historical relation. – Anterior Asia has both elements in one, and has, consequently, a relation to Europe; for what is most remarkable in it, this land has not kept for itself, but sent over to Europe. It presents the origination of all religious and political principles, but Europe has been the scene of their development.

Europe, to which we now come, has not the physical varieties which we noticed in Asia and Africa. The European character involves the disappearance of the contrast exhibited by earlier varieties, or at least a modification of it; so that we have the milder qualities of a transition state. We have in Europe no uplands immediately contrasted with plains. The three sections of Europe require therefore a different basis of classification. The first part is Southern Europe – looking towards the Mediterranean. North of the Pyrenees, mountain-chains run through France, connected with the Alps that separate and cut off Italy from France and Germany. Greece also belongs to this part of Europe. Greece and Italy long presented the theatre of the World's History; and while the middle and north of Europe were uncultivated, the World-Spirit found its home here. The second portion is the heart of Europe, which Caesar opened when conquering Gaul. This achievement was one of manhood on the part of the *Roman* General,

and more productive than that youthful one of Alexander, who undertook to exalt the East to a participation in Greek life; and whose work, though in its purport the noblest and fairest for the imagination, soon vanished, as a mere Ideal, in the sequel. – In this centre of Europe, France, Germany, and England are the principal countries.

Lastly, the third part consists of the north-eastern States of Europe – Poland, Russia, and the Slavonic Kingdoms. They come only late into the series of historical States, and form and perpetuate the connection with Asia. In contrast with the physical peculiarities of the earlier divisions, these are, as already noticed, not present in a remarkable degree, but counterbalance each other.

CLASSIFICATION OF HISTORIC DATA

IN THE GEOGRAPHICAL survey, the course of the World's History has been marked out in its general features. The *Sun* – the Light – rises in the East. Light is a simply self-involved existence; but though possessing thus in itself universality, it exists at the same time as an individuality in the Sun. Imagination has often pictured to itself the emotions of a blind man suddenly becoming possessed of sight, beholding the bright glimmering of the dawn, the growing light, and the flaming glory of the ascending Sun. The boundless forgetfulness of his individuality in this pure splendor, is his first feeling – utter astonishment. But when the Sun is risen, this astonishment is diminished; objects around are perceived, and from them the individual proceeds to the contemplation of his own inner being, and thereby the advance is made to the perception of the relation between the two. Then inactive contemplation is quitted for activity; by the close of day man has erected a building constructed from his own inner Sun; and when in the evening he contemplates this, he esteems it more highly than the original external Sun. For now he stands in a *conscious relation* to his Spirit, and therefore a *free* relation. If we hold this image fast in mind, we shall find it symbolizing the course of History, the great Day's work of Spirit. The History of the World travels from East to West, for Europe is absolutely the end of History, Asia the beginning. The History of the World has an East kat xochn; (the term East in itself is entirely relative), for although the Earth forms a sphere, History performs no circle round it, but has on the contrary a determinate East, viz., Asia. Here rises the outward physical Sun, and in the West it sinks down: here consentaneously rises the Sun of self-consciousness, which diffuses a nobler brilliance. The History

of the World is the discipline of the uncontrolled natural will, bringing it into obedience to a Universal principle and conferring subjective freedom. The East knew and to the present day knows only that *One* is Free; the Greek and Roman world, that *some* are free; the German World knows that *All* are free. The first political form therefore which we observe in History, is *Despotism,* the second *Democracy* and *Aristocracy,* the third *Monarchy.*

To understand this division we must remark that as the State is the universal spiritual life, to which individuals by birth sustain a relation of confidence and habit, and in which they have their existence and reality – the first question is, whether their actual life is an unreflecting use and habit combining them in this unity, or whether its constituent individuals are reflective and personal beings having a properly subjective and independent existence. In view of this, *substantial* [objective] freedom must be distinguished from *subjective* freedom. Substantial freedom is the abstract undeveloped Reason implicit in volition, proceeding to develop itself in the State. But in this phase of Reason there is still wanting personal insight and will, that is, subjective freedom; which is realized only in the Individual, and which constitutes the reflection of the Individual in his own conscience. Where there is merely substantial freedom, commands and laws are regarded as something fixed and abstract, to which the subject holds himself in absolute servitude. These laws need not concur with the desire of the individual, and the subjects are consequently like children, who obey their parents without will or insight of their own. But as subjective freedom arises, and man descends from the contemplation of external reality into his own soul, the contrast suggested by reflection arises, involving the Negation of Reality. The drawing back from the actual world forms *ipso facto* an antithesis, of which one side is the absolute Being, – the Divine – the other the human subject as an individual. In that immediate, unreflected consciousness which characterizes the East, these two are not yet

distinguished. The substantial world is distinct from the individual, but the antithesis has not yet created a schism between (absolute and subjective) Spirit.

The first phase – that with which we have to begin – is the *East.* Unreflected consciousness – substantial, objective, spiritual existence – forms the basis; to which the subjective will first sustains a relation in the form of faith, confidence, obedience. In the political life of the East we find a realized rational freedom, developing itself without advancing to *subjective* freedom. It is the childhood of History. Substantial forms constitute the gorgeous edifices of Oriental *Empires* in which we find all rational ordinances and arrangements, but in such a way, that individuals remain as mere accidents. These revolve round a centre, round the sovereign, who, as patriarch – not as despot in the sense of the *Roman* Imperial Constitution – stands at the head. For he has to enforce the moral and substantial: he has to uphold those essential ordinances which are already established ; so that what among us belongs entirely to subjective freedom, here proceeds from the entire and general body of the State. The glory of Oriental conception is the One Individual as that substantial being to which all belongs, so that no other individual has a separate existence, or mirrors himself in his subjective freedom. All the riches of imagination and Nature are appropriated to that dominant existence in which subjective freedom is essentially merged; the latter looks for its dignity *not* in itself, but in that absolute object. All the elements of a complete State – even subjectivity – may be found there, but not yet harmonized with the grand substantial being. For outside the One Power – before which nothing can maintain an independent existence – there is only revolting caprice, which, beyond the limits of the central power, roves at will without purpose or result. Accordingly we find the wild hordes breaking out from the Upland – falling upon the countries in question, and laying them waste, or settling

down in them, and giving up their wild life; but in all cases resultlessly lost in the central substance. This phase of Substantiality, since it has not taken up its antithesis into itself and overcome it, directly divides itself into two elements. On the one side we see duration, stability – Empires belonging to mere space, as it were (as distinguished from Time) – unhistorical History; – as for example, in China, the State based on the Family relation; – a paternal Government, which holds together the constitution by its provident care, its admonitions, retributive or rather disciplinary inflictions; – a prosaic Empire, because the antithesis of Form, viz., Infinity, Ideality, has not yet asserted itself. On the other side, the Form of Time stands contrasted with this spatial stability. The States in question, without undergoing any change in themselves, or in the principle of their existence, are constantly changing their position towards each other. They are in ceaseless conflict, which brings on. rapid destruction. The opposing principle of individuality enters into these conflicting relations; but it is itself as yet only unconscious, merely natural Universality – Light, which is not yet the light of the personal soul. This History, too (*i.e.,* of the struggles before-mentioned) is, for the most part, really *unhis-torical,* for it is only the repetition of the same majestic ruin. The new element, which in the shape of bravery, prowess, magnanimity, occupies the place of the previous despotic pomp, goes through the same circle of decline and subsidence. This subsidence is therefore not really such, for through all this restless change no advance is made. History passes at this point – and only outwardly, *i.e.,* without connection with the previous phase – to Central Asia.

Continuing the comparison with the ages of the individual man, this would be the boyhood of History, no longer manifesting the repose and trustingness of the child, but boisterous and turbulent. The Greek World may then be compared with the period of adolescence, for here we have

individualities forming themselves. This is the *second* main principle in human History. Morality is, as in Asia, a principle ; but it is morality impressed on individuality, and consequently denoting the free volition of Individuals. Here, then, is the Union of the Moral with the subjective Will, or the Kingdom of *Beautiful Freedom,* for the Idea is united with a plastic form. It is not yet regarded abstractedly, but immediately bound up with the Real, as in a beautiful work of Art; the Sensuous bears the stamp and expression of the Spiritual. This Kingdom is consequently true Harmony; the world of the most charming, but perishable or quickly passing bloom: it is the natural, unreflecting observance of what is *becoming* – not yet true *Morality.* The individual will of the Subject adopts unreflectingly the conduct and habit prescribed by Justice and the Laws. The Individual is therefore in unconscious unity with the Idea – the social weal. That which in the East is divided into two extremes – the substantial as such, and the individuality absorbed in it – meets here. But these distinct principles are only *immediately* in unity, and consequently involve the highest degree of contradiction; for this aesthetic Morality has not yet passed through the struggle of subjective freedom, in its second birth, its *palingenesis*; it is not yet purified to the standard of the free subjectivity that is the essence of true morality.

The third phase is the realm of abstract Universality (in which the Social aim absorbs all individual aims) : it is the *Roman State,* the severe labors of the *Manhood* of History. For true manhood acts neither in accordance with the caprice of a despot, nor in obedience to a graceful caprice of its own; but works for a general aim, one in which the individual perishes and realizes his own private object only in that general aim. The State begins to have an abstract existence, and to develop itself for a definite object, in accomplishing which its members have indeed a share, but not a complete and concrete one [calling their whole being into play]. Free *individuals* are

sacrificed to the severe demands of the *National* objects, to which they must surrender themselves in this service of abstract generalization. The Roman State is not a repetition of such a State of Individuals as the Athenian Polis was. The geniality and joy of soul that existed there have given place to harsh and rigorous toil. The interest of History is detached from individuals, but these gain for themselves abstract, formal Universality. The Universal subjugates the individuals; they have to merge their own interests in it; but in return the abstraction which they themselves embody – that is to say, their personality – is recognized: in their individual capacity they become persons with definite rights as such. In the same sense as individuals may be said to be incorporated in the abstract idea of Person, *National Individualities* (those of the Roman Provinces) have also to experience this fate: in this form of Universality their concrete forms are crushed, and incorporated with it as a homogeneous and indifferent mass. Rome becomes a Pantheon of all deities, and of all Spiritual existence, but these divinities and this Spirit do not retain their proper vitality. – The development of the State in question proceeds in two directions. On the one hand, as based on reflection – abstract Universality – it has the express outspoken antithesis in itself: it therefore essentially involves in itself the struggle which that antithesis supposes; with the necessary issue, that individual caprice – the purely contingent and thoroughly worldly power of *one despot* – gets the better of that abstract universal principle. At the very outset we have the antithesis between the Aim of the State as the abstract universal principle on the one hand, and the abstract personality of the individual on the other hand. But when subsequently, in the historical development, individuality gains the ascendant, and the breaking up of the community into its component atoms can only be restrained by external compulsion, then the subjective might of *individual despotism* comes forward to play its part, as if summoned to fulfil this task. For the mere abstract compliance with Law

implies on the part of the subject of law the supposition that he has not attained to selforganization and self-control ; and this principle of obedience, instead of being hearty and voluntary, has for its motive and ruling power only the arbitrary and contingent disposition of the individual; so that the latter is led to seek consolation for the loss of his freedom in exercising and developing his private right. This is the purely *worldly* harmonization of the antithesis. But in the next place, the pain inflicted by Despotism begins to be felt, and Spirit driven back into its utmost depths, leaves the godless world, seeks for a harmony in itself, and begins now an inner life – a complete concrete subjectivity, which possesses at the same time a substantiality that is not grounded in mere external existence. Within the soul therefore arises the *Spiritual* pacification of the struggle, in the fact that the individual personality, instead of following its own capricious choice, is purified and elevated into universality; – a subjectivity that of its own free will adopts principles tending to the good of all – reaches, in fact, a divine personality. To that worldly empire, this Spiritual one wears a predominant aspect of opposition, as the empire of a subjectivity that has attained to the knowledge of itself – itself in its essential nature – the Empire of Spirit in its full sense.

The *German* world appears at this point of development – the fourth phase of World-History. This would answer in the comparison with the periods of human life to its *Old Age.* The Old Age of *Nature* is weakness; but that of *Spirit* is its perfect maturity and *strength,* in which it returns to unity with itself, but in its fully developed character as *Spirit.* – This fourth phase begins with the Reconciliation presented in Christianity; but only in the germ, without national or political development. We must therefore regard it as commencing rather with the enormous contrast between the spiritual, religious principle, and the barbarian Real World. For Spirit as the consciousness of an inner World is, at the commencement, itself still in an

abstract form. All that is *secular* is consequently given over to rudeness and capricious violence. The *Mohammedan* principle – the enlightenment of the Oriental World – is the first to contravene this barbarism and caprice. We find it developing itself later and more rapidly than Christianity; for the latter needed eight centuries to grow up into a political form. But that principle of the German World which we are now discussing, attained concrete reality only in the history of the German Nations. The contrast of the Spiritual principle animating the *Ecclesiastical* State, with the rough and wild barbarism of the *Secular* State, is here likewise present. The Secular *ought* to be in harmony with the Spiritual principle, but we find nothing more than the *recognition* of that obligation. The Secular power forsaken by the Spirit, must in the first instance vanish in presence of the Ecclesiastical (as representative of Spirit) ; but while this latter degrades itself to mere secularity, it loses its influence with the loss of its proper character and vocation. From this corruption of the Ecclesiastical element – that is, of the Church – results the higher form of rational thought. Spirit once more driven back upon itself, produces its work in an intellectual shape, and becomes capable of realizing the Ideal of Reason from the Secular principle alone. Thus it happens, that in virtue of elements of Universality, which have the principle of Spirit as their basis, the empire of Thought is established actually and concretely. The antithesis of Church and State vanishes. The Spiritual becomes reconnected with the Secular, and develops this latter as an independently organic existence. The State no longer occupies a position of real inferiority to the Church, and is no longer subordinate to it. The latter asserts no prerogative, and the Spiritual is no longer an element foreign to the State. Freedom has found the means of realizing its Ideal – its true existence. This is the ultimate result which the process of History is intended to accomplish, and we have to traverse in detail the long track which has been thus cursorily traced out. Yet length of

Time is something entirely relative, and the element of Spirit is Eternity. Duration, properly speaking, cannot be said to belong to it.

PART I: THE ORIENTAL WORLD

We have to begin with the Oriental World, but not before the period in which we discover States in it. The diffusion of Language and the formation of races lie beyond the limits of History. History is prose, and myths fall short of History. The consciousness of external definite existence only arises in connection with the power to form abstract distinctions and assign abstract predicates; and in proportion as a capacity for expressing Laws (of natural or social life) is acquired, in the same proportion does the ability manifest itself to comprehend objects in an unpoetical form. While the ante-historical is that which precedes political life, it also lies beyond self-cognizant life; though surmises and suppositions may be entertained respecting that period, these do not amount to facts. The Oriental World has as its inherent and distinctive principle the Substantial (the Prescriptive), in Morality. We have the first example of a subjugation of the mere arbitrary will, which is merged in this substantiality. Moral distinctions and requirements are expressed as Laws, but so that the subjective will is governed by these Laws as by an external force. Nothing subjective in the shape of disposition, Conscience, formal Freedom, is recognized. Justice is administered only on the basis of external morality, and Government exists only as the prerogative of compulsion. Our civil law contains indeed some purely compulsory ordinances. I can be compelled to give up another man's property, or to keep an agreement which I have made; but the Moral is not placed by *us* in the mere compulsion, but in the disposition of the subjects – their sympathy with the requirements of law. Morality is in the East likewise a subject of positive legislation, and although the moral prescriptions (the *substance* of their Ethics) may be perfect, what should be

internal subjective sentiment is made a matter of external arrangement. There is no want of a will to command moral actions, but of a will to perform them because commanded from *within.* Since Spirit has not yet attained subjectivity, it wears the appearance of spirituality still involved in the conditions of Nature. Since the external and the internal, Law and Moral Sense, are not yet distinguished – still form an undivided unity – so also do Religion and the State. The Constitution generally is a Theocracy, and the Kingdom of God is to the same extent also a secular Kingdom as the secular Kingdom is also divine. What we call God has not yet in the East been realized in consciousness, for our idea of God involves an elevation of the soul to the supersensual. While *we* obey, because what we are required to do is confirmed by an *internal* sanction, there the Law is regarded as inherently and absolutely valid without a sense of the want of this subjective confirmation. In the law men recognize not their own will, but one entirely foreign. Of the several parts of Asia we have already eliminated as unhistorical, Upper Asia (so far and so long as its Nomad population do not appear on the scene of history), and Siberia. The rest of the Asiatic World is divided into four districts: first, the River-Plains, formed by the Yellow and Blue Stream, and the Upland of farther Asia – China and the Mongols. Secondly, the valley of the Ganges and that of the Indus. The third theatre of History comprises the river-plains of the Oxus and Jaxartes, the Upland of Persia, and the other valley-plains of the Euphrates and Tigris, to which Hither-Asia attaches itself. Fourthly, the River-plain of the Nile.

With *China* and the *Mongols* – the realm of theocratic despotism – History begins. Both have the patriarchal constitution for their principle – so modified in China, as to admit the development of an organized system of secular polity; while among the Mongols it limits itself to the simple form of a spiritual, religious sovereignty. In China the Monarch is Chief as

Patriarch. The laws of the state are partly civil ordinances, partly moral requirements; so that the internal law – the knowledge on the part of the individual of the nature of his volition, as his own inmost self – even this is the subject of external statutory enactment. The sphere of subjectivity does not then, attain to maturity here, since moral laws are treated as legislative enactments, and law on its part has an ethical aspect. All that we call subjectivity is concentrated in the supreme head of the State, who, in all his legislation has an eye to the health, wealth, and benefit of the whole. Contrasted with this secular Empire is the spiritual sovereignty of the Mongols, at the head of which stands the Lama, who is honored as God. In this Spiritual Empire no secular political life can be developed.

In the second phase – the *Indian* realm – we see the unity of political organization – a perfect civil machinery, such as exists in China – in the first instance, broken up. The several powers of society appear as dissevered and free in relation to each other. The different castes are indeed, fixed; but in view of the religious doctrine that established them, they wear the aspect of *natural* distinctions. Individuals are thereby still further stripped of proper personality – although it might appear as if they derived gain from the development of the distinctions in question. For though we find the organization of the State no longer, as in China, determined and arranged by the one all-absorbing personality (the head of the State) the distinctions that exist are attributed to Nature, and so become differences of Caste. The unity in which these divisions must finally meet, is a religious one; and thus arises Theocratic Aristocracy and its despotism. Here begins, therefore, the distinction between the spiritual consciousness and secular conditions; but as the *separation* implied in the above mentioned distinctions is the cardinal consideration, so also we find in the religion the principle of the isolation of the constituent elements of the Idea; – a principle which posits the harshest antithesis – the conception of the purely

abstract unity of God, and of the purely sensual Powers of Nature. The connection of the two is only a constant change – a restless hurrying from one extreme to the other – a wild chaos of fruitless variation, which must appear as madness to a duly regulated, intelligent consciousness.

The third important form – presenting a contrast to the immovable unity of China and to the wild and turbulent unrest of India – is the *Persian* Realm. China is quite peculiarly Oriental ; India we might compare with Greece; Persia on the other hand with Rome. In Persia namely, the Theocratic power appears as a *Monarchy.* Now Monarchy is that kind of constitution which does indeed unite the members of the body politic in the head of the government as in a point; but regards that head neither as the absolute director nor the arbitrary ruler, but as a power whose will is regulated by the same principle of law as the obedience of the subject. We have thus a general principle, a Law, lying at the basis of the whole, but which, still regarded as a dictum of mere Nature (not as free and absolute Truth) is clogged by an antithesis (that of formal freedom on the part of man as commanded to obey positive alien requirements). The representation, therefore, which Spirit makes of itself is, at this grade of progress, of a purely natural kind – Light. This Universal principle is as much a regulative one for the monarch as for each of his subjects, and the Persian Spirit is accordingly clear, illuminated – the idea of a people living in pure morality, as in a sacred community. But this has on the one hand as a merely natural Ecclesia, the above antithesis still unreconciled; and its sanctity displays the characteristics of a compulsory, external one. On the other hand this antithesis is exhibited in Persia in its being the Empire of hostile peoples, and the union of the most widely differing nations. The Persian Unity is not that abstract one of the Chinese Empire; it is adapted to rule over many and various nationalities, which it unites under the mild power of Universality as a beneficial Sun shining over all – waking them

into life and cherishing their growth. This Universal principle – occupying the position of a root only – allows the several members a free growth for unrestrained expansion and ramification. In the organization of these several peoples, the various principles and forms of life have full play and continue to exist together. We find in this multitude of nations, roving Nomades; then we see in Babylonia and Syria commerce and industrial pursuits in full vigor, the wildest sensuality, the most uncontrolled turbulence. The coasts mediate a connection with foreign lands. In the midst of this confusion the spiritual God of the Jews arrests our attention – like Brahm, existing only for Thought, yet jealous and excluding from his being and abolishing all distinct speciality of manifestations [avatars], such as are freely allowed in other religions. This Persian Empire, then – since it can tolerate these several principles, exhibits the Antithesis in a lively active form, and is not shut up within itself, abstract and calm, as are China and India – makes a real transition in the History of the World. If Persia forms the *external* transition to Greek life, the internal, *mental* transition is mediated by *Egypt*. Here the antitheses in their abstract form are broken through; a breaking through which effects their nullification. This undeveloped reconciliation exhibits the struggle of the most contradictory principles, which are not yet capable of harmonizing themselves, but, setting up the birth of this harmony as the problem to be solved, make themselves a riddle for themselves and for others, the solution of which is only to be found in the *Greek* World. If we compare these kingdoms in the light of their various fates, we find the empire of the two Chinese rivers the only durable kingdom in the World. Conquests cannot affect such an empire. The world of the Ganges and the Indus has also been preserved. A state of things so destitute of (distinct) thought is likewise imperishable, but it is in its very nature destined to be mixed with other races – to be conquered and subjugated. While these two realms have remained to the

present day, of the empires of the Tigris and Euphrates on the contrary nothing remains, except, at most, a heap of bricks; for the Persian Kingdom, as that of Transition, is by nature perishable, and the Kingdoms of the Caspian Sea are given up to the ancient struggle of Iran and Turan. The Empire of the solitary Nile is only present *beneath* the ground, in its speechless Dead, ever and anon stolen away to all quarters of the globe, and in their majestic habitations; – for what remains above ground is nothing else but such splendid tombs.

SECTION I: CHINA

WITH THE EMPIRE of China History has to begin, for it is the oldest, as far as history gives us any information ; and its *principle* has such substantiality, that for the empire in question it is at once the oldest and the newest. Early do we see China advancing to the condition in which it is found at this day ; for as the contrast between objective existence and subjective freedom of movement in it, is still wanting, every change is excluded, and the fixedness of a character which recurs perpetually, takes the place of what we should call the truly historical. China and India lie, as it were, still outside the World's History, as the mere presupposition of elements whose combination must be waited for to constitute their vital progress. The unity of substantiality and subjective freedom so entirely excludes the distinction and contrast of the two elements, that by this very fact, substance cannot arrive at reflection on itself – at subjectivity. The Substantial [Positive] in its moral aspect, rules therefore, not as the moral disposition of the *Subject,* but as the despotism of the *Sovereign.*

No People has a so strictly continuous series of Writers of History as the Chinese. Other Asiatic peoples also have ancient traditions, but no History. The Vedas of the Indians are not such. The traditions of the Arabs are very old, but are not attached to a political constitution and its development. But such a constitution exists in China, and that in a distinct and prominent form. The Chinese traditions ascend to 3000 years before Christ; and the *Shu-King,* their canonical document, beginning with the government of Yao, places this 2357 years before Christ. It may here be incidentally remarked, that the other Asiatic kingdoms also reach a high antiquity. According to the calculation of an English writer, the Egyptian history (*e.g.*) reaches to 2207

years before Christ, the Assyrian to 2221, the Indian to 2204. Thus the traditions respecting the principal kingdoms of the East reach to about 2300 years before the birth of Christ. Comparing this with the history of the Old Testament, a space of 2400 years, according to the common acceptation, intervened between the Noachian Deluge and the Christian era. But Johannes von Müller has adduced weighty objections to this number. He places the Deluge in the year 3473 before Christ – thus about 1000 years earlier – supporting his view by the Septuagint. I remark this only with the view of obviating a difficulty that may appear to arise when we meet with dates of a higher age than 2400 years before Christ, and yet find nothing about the Flood. – The Chinese have certain ancient canonical documents, from which their history, constitution, and religion can be gathered. The Vedas and the Mosaic records are similar books; as also the Homeric poems. Among the Chinese these books are called *Kings,* and constitute the foundation of all their studies. The *Shu-King* contains their history, treats of the government of the ancient kings, and gives the statutes enacted by this or that monarch. The *Y-King* consists of figures, which have been regarded as the bases of the Chinese written character, and this book is also considered the groundwork of the Chinese Meditation. For it begins with the abstractions of Unity and Duality, and then treats of the concrete existences pertaining to these abstract forms of thought. Lastly, the *Shi-King* is the book of the oldest poems in a great variety of styles. The high officers of the kingdom were anciently commissioned to bring with them to the annual festival all the poems composed in their province within the year. The Emperor in full court was the judge of these poems, and those recognized as good received public approbation. Besides these three books of archives which are specially honored and studied, there are besides two others, less important, viz. the *Li-Ki* (or *Li-King)* which records the customs and ceremonial observances pertaining to the Imperial dignity, and that of

the State functionaries (with an appendix, *Yo-King,* treating of music); and the *Tshun-tsin,* the chronicle of the kingdom Lu, where Confucius appeared. These books are the groundwork of the history, the manners and the laws of China. This empire early attracted the attention of Europeans, although only vague stories about it had reached them. It was always marvelled at as a country which, self-originated, appeared to have no connection with the outer world. In the thirteenth century a Venetian (Marco Polo) explored it for the first time, but his reports were deemed fabulous. In later times, everything that he had said respecting its extent and greatness was entirely confirmed. By the lowest calculation, China has 150,000,000 of inhabitants; another makes the number 200,000,000, and the highest raises it even to 300,000,- 000. From the far north it stretches towards the south to India; on the east it is bounded by the vast Pacific, and on the west it extends towards Persia and the Caspian. China Proper is over- populated. On both rivers, the Hoang-ho and the Yang-tse-Kiang, dwell many millions of human beings, living on rafts adapted to all the requirements of their mode of life. The population and the thoroughly organized State-arrangements, descending even to the minutest details, have astonished Europeans ; and a matter of especial astonishment is the accuracy with which their historical works are executed. For in China the Historians are some of the highest functionaries. Two ministers constantly in attendance on the Emperor, are commissioned to keep a journal of everything the Emperor does, commands, and says, and their notes are then worked up and made use of by the Historians. We cannot go further into the minutiae of their annals, which, as they themselves exhibit no development, would only hinder us in ours. Their History ascends to very ancient times, in which Fohi is named as the Diffuser of culture, he having been the original civilizer of China. He is said to have lived in the twenty-ninth century before Christ – before the time, therefore, at which the Shu-King begins; but the mythical and prehistorical

is treated by Chinese Historians as perfectly historical. The first region of Chinese history is the north- western corner – China Proper – towards that point where the Hoang-ho descends from the mountains; for only at a later period did the Chinese empire extend itself towards the south, to the Yang-tse-Kiang. The narrative begins with the period in which men lived in a wild state, *i.e.,* in the woods, when they fed on the fruits of the earth, and clothed themselves with the skins of wild beasts. There was no recognition of definite laws among them. To Fohi (who must be duly distinguished from Fo, the founder of a new religion) is ascribed the instruction of men in building themselves huts and making dwellings. He is said to have directed their attention to the change and return of seasons, to barter and trade; to have established marriage; to have taught that Reason came from Heaven, and to have given instructions for rearing silkworms, building bridges, and making use of beasts of burden. The Chinese historians are very diffuse on the subject of these various origins. The progress of the history is the extension of the culture thus originated, to the south, and the beginning of a state and a government. The great Empire which had thus gradually been formed, was soon broken up into many provinces, which carried on long wars with each other, and were then reunited into a Whole. The dynasties in China have often been changed, and the one now dominant is generally marked as the twenty-second. In connection with the rise and fall of these dynasties arose the different capital cities that are found in this empire. For a long time Nankin was the capital; now it is Pekin; at an earlier period other cities. China has been compelled to wage many wars with the Tartars, who penetrated far into the country. The long wall built by Shi-hoang-ti – and which has always been regarded as a most astounding achievement – was raised as a barrier against the inroads of the northern Nomades. This prince divided the whole empire into thirty-six provinces, and made himself especially remarkable by his attacks on the old literature, especially on the

historical books and historical studies generally. He did this with the design of strengthening his own dynasty, by destroying the remembrance of the earlier one. After the historical books had been collected and burned, many hundreds of the literati fled to the mountains, in order to save what remained. Every one that fell into the Emperor's hands experienced the same fate as the books. This Book- burning is a very important circumstance, for in spite of it the strictly canonical books were saved, as is generally the case. The first connection of China with the West occurred about 64 A.D. At that epoch a Chinese emperor despatched ambassadors (it is said) to visit the wise sages of the West. Twenty years later a Chinese general is reported to have penetrated as far as Judea. At the beginning of the eighth century after Christ, the first Christians are reputed to have gone to China, of which visit later visitors assert that they found traces and monuments. A Tartar kingdom, *Lyan-Tong,* existing in the north of China, is said to have been reduced and taken possession of by the Chinese with the help of the Western Tartars, about 1100 A.D. This, nevertheless, gave these very Tartars an opportunity of securing a footing in China. Similarly they admitted the Manchus with whom they engaged in war in the sixteenth and seventeenth centuries, which resulted in the present dynasty's obtaining possession of the throne. Yet this new dynasty has not effected further change in the country, any more than did the earlier conquest of the Mongols in the year 1281. The Manchus that live in China have to conform to Chinese laws, and study Chinese sciences.

We pass now from these few dates in Chinese history to the contemplation of the *Spirit* of the constitution, which has always remained the same. We can deduce it from the general principle, which is, the immediate unity of the substantial Spirit and the Individual; but this is equivalent to the Spirit of the Family, which is here extended over the most populous of countries. The element of Subjectivity – that is to say, the

reflection upon itself of the individual will in antithesis to the Substantial (as the power in which it is absorbed) or the recognition of this power as *one with its own essential being,* in which it knows itself *free* – is not found on this grade of development. The universal Will displays its activity immediately through that of the individual: the latter has no self-cognizance at all in antithesis to Substantial, positive being, which it does not yet regard as a power standing over against it – as, (*e.g.*) in Judaism, the "Jealous God" is known as the negation of the Individual. In China the Universal Will immediately commands what the Individual is to do, and the latter complies and obeys with proportionate renunciation of reflection and personal independence. If he does not obey, if he thus virtually separates himself from the Substance of his being, inasmuch as this separation is not mediated by a retreat within a personality of his own, the punishment he undergoes does not affect his subjective and internal, but simply his outward existence. The element of subjectivity is therefore as much wanting to this political totality as the latter is on its side altogether destitute of a foundation in the moral disposition of the subject. For the Substance is simply an individual – the Emperor – whose law constitutes all the disposition.

Nevertheless, this ignoring of inclination does not imply caprice, which would itself indicate inclination – that is, subjectivity and mobility. Here we have the One Being of the State supremely dominant – the Substance, which, still hard and inflexible, resembles nothing but itself – includes no other element. This relation, then, expressed more definitely and more conformably with its conception, is that of the *Family.* On this form of moral union alone rests the Chinese State, and it is objective Family Piety that characterizes it. The Chinese regard themselves as belonging to their family, and at the same time as children of the State. In the Family itself they are not personalities, for the consolidated unity in which they exist as

members of it is consanguinity and natural obligation. In the ‘State they have as little independent personality; for there the patriarchal relation is predominant, and the government is based on the paternal management of the Emperor, who keeps all departments of the State in order. Five duties are stated in the *Shu-King* as involving grave and unchangeable fundamental relations, 1. The mutual one of the Emperor and people. 2. Of the Fathers and Children. 3. Of an elder and younger brother. 4. Of Husband and Wife. 5. Of Friend and Friend. It may be here incidentally remarked, that the number Five is regarded as fundamental among the Chinese, and presents itself as often as the number Three among us. They have five Elements of Nature – Air, Water, Earth, Metal, and Wood. They recognize *four* quarters of Heaven and a centre. Holy places, where altars are erected, consist of four elevations, and one in the centre. The duties of the Family are absolutely binding, and established and regulated by law. The son may not accost the father, when he comes into the room; he must seem to contract himself to nothing at the side of the door, and may not leave the room without his father’s permission. When the father dies, the son must mourn for three years – abstaining from meat and wine. The business in which he was engaged, even that of the State, must be suspended, for he is obliged to quit it. Even the Emperor, who has just commenced his government, does not devote himself to his duties during this time. No marriage may be contracted in the family within the period of mourning. Only the having reached his fiftieth year exempts the bereaved from the excessive strictness of the regulations, which are then relaxed that he may not be reduced in person by them. The sixtieth year relaxes them still further, and the seventieth limits mourning to the color of the dress.

A mother is honored equally with a father. When Lord Macartney saw the Emperor, the latter was sixty-eight years old, (sixty years is among the Chinese a fundamental round number, as one hundred is among us),

notwithstanding which he visited his mother every morning on foot, to demonstrate his respect for her. The New Year's congratulations are offered even to the mother of the Emperor; and the Emperor himself cannot receive the homage of the grandees of the court until he has paid his to his mother. The latter is the first and constant counsellor of her son, and all announcements concerning his family are made in her name. – The merits of a son are ascribed not to him, but to his father. When on one occasion the prime minister asked the Emperor to confer titles of honor on his father, the Emperor issued an edict in which it was said: "Famine was desolating the Empire: Thy father gave rice to the starving. What beneficence! The Empire was on the edge of ruin: Thy father defended it at the hazard of his life. What fidelity! The government of the kingdom was intrusted to thy father: he made excellent laws, maintained peace and concord with the neighboring princes, and asserted the rights of my crown. What wisdom! The title therefore which I award to him is: Beneficent, Faithful and Wise." – The Son had done all that is here ascribed to the Father. In this way ancestors – a fashion the reverse of ours – obtain titles of honor through their posterity. But in return, every Father of a Family is responsible for the transgressions of his descendants; duties ascend, but none can be properly said to descend.

It is a great object with the Chinese, to have children who may give them the due honors of burial, pay respect to their memory after death, and decorate their grave. Although a Chinese may have many wives, one only is the mistress of the house, and the children of the subordinate wives have to honor her absolutely as a mother. If a Chinese husband has no children by any of his wives, he may proceed to adoption with a view to this posthumous honor. For it is an indispensable requirement that the grave of parents be annually visited. Here lamentations are annually renewed, and many, to give full vent to their grief, remain there sometimes one or two months. The body of a deceased father is often kept three or four months in

the house, and during this time no one may sit down on a chair or sleep in a bed. Every family in China has a Hall of Ancestors where all the members annually assemble; there are placed representations of those who have filled exalted posts, while the names of those men and women who have been of less importance in the family are inscribed on tablets; the whole family then partake of a meal together, and the poor members are entertained by the more wealthy. It is said that a Mandarin who had become a Christian, having ceased to honor his ancestors in this way, exposed himself to great persecutions on the part of his relatives. The same minuteness of regulation which prevails in the relation between father and children, characterizes also that between the elder brother and the younger ones. The former has, though in a less degree than parents, claims to reverence.

This family basis is also the basis of the Constitution, if we can speak of such. For although the Emperor has the right of a Monarch, standing at the summit of a political edifice, he exercises it paternally. He is the Patriarch, and everything in the State that can make any claim to reverence is attached to him. For the Emperor is chief both in religious affairs and in science – a subject which will be treated of in detail further on. – This paternal care on the part of the Emperor, and the spirit of his subjects – who like children do not advance beyond the ethical principle of the family circle, and can gain for themselves no independent and civil freedom – makes the whole an empire, administration, and social code, which is at the same time moral and thoroughly prosaic – that is, a product of the Understanding without free Reason and Imagination.

The Emperor claims the deepest reverence. In virtue of his position he is obliged personally to manage the government, and must himself be acquainted with and direct the legislative business of the Empire, although the Tribunals give their assistance. Notwithstanding this, there is little room for the exercise of his individual will; for the whole government is

conducted on the basis of certain ancient maxims of the Empire, while his constant oversight is not the less necessary. The imperial princes are therefore educated on the strictest plan. Their physical frames are hardened by discipline, and the sciences are their occupation from their earliest years. Their education is conducted under the Emperor's superintendence, and they are early taught that the Emperor is the head of the State and therefore must appear as the first and best in everything. An examination of the princes takes place every year, and a circumstantial report of the affair is published through the whole Empire, which feels the deepest interest in these matters. China has therefore succeeded in getting the greatest and best governors, to whom the expression "Solomonian Wisdom" might be applied; and the present Manchu dynasty has especially distinguished itself by abilities of mind and body. All the ideals of princes and of princely education which have been so numerous and varied since the appearance of Fenelon's "Telemaque" are realized here. In Europe there can be no Solomons.

But here are the place and the necessity for such government ; since the rectitude, the prosperity, the security of all, depend on the one impulse given to the first link in the entire chain of this hierarchy. The deportment of the Emperor is represented to us as in the highest degree simple, natural, noble and intelligent. Free from a proud taciturnity or repelling *hauteur* in speech or manners, he lives in the consciousness of his own dignity and in the exercise of imperial duties to whose observance he has been disciplined from his earliest youth. Besides the imperial dignity there is properly no elevated rank, no nobility among the Chinese; only the princes of the imperial house, and the sons of the ministers enjoy any precedence of the kind, and they rather by their position than by their birth. Otherwise all are equal, and only those have a share in the administration of affairs who have ability for it. Official stations are therefore occupied by men of the greatest

intellect and education. The Chinese State has consequently been often set up as an Ideal which may serve even us for a model.

The next thing to be considered is the *administration* of the Empire. We cannot speak, in reference to China, of a *Constitution;* for this would imply that individuals and corporations have independent rights – partly in respect of their particular interests, partly in respect of the entire State. This element must be wanting here, and we can only speak of an administration of the Empire. In China, we have the reality of absolute equality, and all the differences that exist are possible only in connection with that administration, and in virtue of the worth which a person may acquire, enabling him to fill a high post in the Government. Since equality prevails in China, but without any freedom, despotism is necessarily the mode of government. Among us, men are equal only before the law, and in the respect paid to the property of each; but they have also many interests and peculiar privileges, which must be guaranteed, if we are to have what we call freedom. But in the Chinese Empire these special interests enjoy no consideration on their own account, and the government proceeds from the Emperor alone, who sets it in movement as a hierarchy of officials or Mandarins. Of these, there are two kinds – learned and military Mandarins – the latter corresponding to our Officers. The Learned Mandarins constitute the higher rank, for, in China, civilians take precedence of the military. Government officials are educated at the schools; elementary schools are instituted for obtaining elementary knowledge. Institutions for higher cultivation, such as our Universities, may, perhaps, be said not to exist. Those who wish to attain high official posts must undergo several examinations – usually three in number. To the third and last examination – at which the Emperor himself is present – only those can be admitted who have passed the first and second with credit; and the reward for having succeeded in this, is the immediate introduction into the highest Council of

the Empire. The sciences, an acquaintance with which is especially required, are the History of the Empire, Jurisprudence, and the science of customs and usages, and of the organization and administration of government. Besides this, the Mandarins are said to have a talent for poetry of the most refined order. We have the means of judging of this, particularly from the Romance, *Ju-kiao-li,* or, “The Two Cousins,” translated by Abel Remusat: in this, a youth is introduced who having finished his studies, is endeavoring to attain high dignities. The officers of the army, also, must have some mental acquirements; they too are examined; but civil functionaries enjoy, at stated above, far greater respect. At the great festivals the Emperor appears with a retinue of two thousand Doctors, *i.e.* Mandarins in Civil Offices, and the same number of military Mandarins. (In the whole Chinese State, there are about 15,000 civil, and 20,000 military Mandarins.) The Mandarins who have not yet obtained an office, nevertheless belong to the Court, and are obliged to appear at the great festivals in the Spring and Autumn, when the Emperor himself guides the plough. These functionaries are divided into eight classes. The first are those that attend the Emperor, then follow the viceroys, and so on. The Emperor governs by means of administrative bodies, for the most part composed of Mandarins. The Council of the Empire is the highest body of the kind: it consists of the most learned and talented men. From these are chosen the presidents of the other colleges. The greatest publicity prevails in the business of government. The subordinate officials report to the Council of the Empire, and the latter lay the matter before the Emperor, whose decision is made known in the Court Journal. The Emperor often accuses himself of faults; and should his princes have been unsuccessful in their examination, he blames them severely. In every Ministry, and in various parts of the Empire, there is a Censor (*Ko-tao*), who has to give the Emperor an account of everything. These Censors enjoy a permanent office,

and are very much feared. They exercise a strict surveillance over everything that concerns the government, and the public and private conduct of the Mandarins, and make their report immediately to the Emperor. They have also the right of remonstrating with and blaming *him.* The Chinese History gives many examples of the noble-mindedness and courage of these Ko-taos. For example: A Censor had remonstrated with a tyrannical sovereign, but had been severely repulsed. Nevertheless, he was not turned away from his purpose, but betook himself once more to the Emperor to renew his remonstrances. Foreseeing his death, he had the coffin brought in with him, in which he was to be buried. It is related of the Censors, that – cruelly lacerated by the torturers and unable to utter a sound – they have even written their animadversions with their own blood in the sand. These Censors themselves form yet another Tribunal which has the oversight of the whole Empire. The Mandarins are responsible also for performing duties arising from unforeseen exigencies in the State. If famine, disease, conspiracy, religious disturbances occur, they have to report the facts; not, however, to wait for further orders from government, but immediately to act as the case requires. The whole of the administration is thus covered by a network of officials. Functionaries are appointed to superintend the roads, the rivers, and the coasts. Everything is arranged with the greatest minuteness. In particular, great attention is paid to the rivers; in the *Shu-King* are to be found many edicts of the Emperor, designed to secure the land from inundations. The gates of every town are guarded by a watch, and the streets are barred all night. Government officers are always answerable to the higher Council. Every Mandarin is also bound to make known the faults he has committed, every five years; and the trustworthiness of his statement is attested by a Board of Control – the Censorship. In the case of any grave crime not confessed, the Mandarins and their families are punished most severely. From all this it is clear that

the Emperor is the centre, around which everything turns; consequently the well-being of the country and people depends on him. The whole hierarchy of the administration works more or less according to a settled routine, which in a peaceful condition of things becomes a convenient habit. Uniform and regular, like the course of nature, it goes its own way, at one time as at another time; but the Emperor is required to be the moving, ever wakeful, spontaneously active Soul. If then the personal character of the Emperor is not of the order described – namely, thoroughly *moral,* laborious, and while maintaining dignity, full of energy – everything is relaxed, and the government is paralyzed from head to foot, and given over to carelessness and caprice. For there is no other legal power or institution extant, but this superintendence and oversight of the Emperor. It is not their own conscience, their own honor, which keeps the offices of government up to their duty, but an external mandate and the severe sanctions by which it is supported. In the instance of the revolution that occurred in the middle of the seventeenth century, the last Emperor of the dynasty was very amiable and honorable; but through the mildness of his character, the reins of government were relaxed, and disturbances naturally ensued. The rebels called the Manchus into the country. The Emperor killed himself to avoid falling into the hands of his enemies, and with his blood wrote on the border of his daughter's robe a few words, in which he complained bitterly of the injustice of his subjects. A Mandarin, who was with him, buried him, and then killed himself on his grave. The Empress and her attendants followed the example. The last prince of the imperial house, who was besieged in a distant province, fell into the hands of the enemy and was put to death. All the other attendant Mandarins died a voluntary death. Passing from the administration to the *Jurisprudence* of China, we find the subjects regarded as in a state of nonage, in virtue of the principle of patriarchal government. No independent classes or orders, as in India, have interests of their own to

defend. All is directed and superintended from above. All legal relations are definitely settled by rules; free sentiment – the moral standpoint generally – is thereby thoroughly obliterated. It is formally determined by the laws in what way the members of the family should be disposed towards each other, and the transgression of these laws entails in some cases severe punishment. The second point to be noticed here, is the legal externality of the Family relations, which becomes almost slavery. Every one has the power of selling himself and his children; every Chinese buys his wife. Only the chief wife is a free woman. The concubines are slaves, and – like the children and every other chattel – may be seized upon in case of confiscation.

A third point is, that punishments are generally corporal chastisements. Among us, this would be an insult to honor; not so in China, where the feeling of honor has not yet developed itself. A dose of cudgelling is the most easily forgotten; yet it is the severest punishment for a man of honor, who desires not to be esteemed physically assailable, but who is vulnerable in directions implying a more refined sensibility. But the Chinese do not recognize a subjectivity in honor; they are the subjects rather of corrective than retributive punishment – as are children among us; for *corrective* punishment aims at improvement, that which is *retributive* implies veritable imputation of guilt. In the *corrective,* the deterring principle is only the fear of punishment, not any consciousness of wrong; for here we cannot presume upon any reflection upon the nature of the action itself. Among the Chinese all crimes – those committed against the laws of the Family relation, as well as against the State – :are punished externally. Sons who fail in paying due honor to their Father or Mother, younger brothers who are not sufficiently respectful to elder ones, are bastinadoed. If a son complains of injustice done to him by his father, or a younger brother by an elder, he receives a hundred blows with a bamboo, and is banished for three years, *if he is in the right*; if not, he is strangled. If a son should raise his hand

against his father, he is condemned to have his flesh torn from his body with red-hot pincers. The relation between husband and wife is, like all other family relations, very highly esteemed, and unfaithfulness – which, however, on account of the seclusion in which the women are kept, can very seldom present itself – meets with severe animadversion. Similar penalties await the exhibition on the part of a Chinese of greater affection to one of his inferior wives than to the matron who heads his establishment, should the latter complain of such disparagement. In China, every Mandarin is authorized to inflict blows with the bamboo; even the highest and most illustrious – Ministers, Viceroys, and even the favorites of the Emperor himself – are punished in this fashion. The friendship of the Emperor is not withdrawn on account of such chastisement, and they themselves appear not sensibly touched by it. When, on one occasion, the last English embassy to China was conducted home from the palace by the princes and their retinue, the Master of the Ceremonies, in order to make room, without any ceremony cleared the way among the princes and nobles with a whip. As regards responsibility, the distinction between *malice prepense* and blameless or accidental commission of an act is not regarded; for accident among the Chinese is as much charged with blame, as intention. Death is the penalty of accidental homicide. This ignoring of the distinction between accident and intention occasions most of the disputes between the English and the Chinese; for should the former be attacked by the latter – should a ship of war, believing itself attacked, defend itself, and a Chinese be killed as the consequence – the Chinese are accustomed to require that the Englishman who fired the fatal shot should lose his life. Everyone who is in any way connected with the transgressor, shares – especially in the case of crimes against the Emperor – the ruin of the actual offender: all his near kinsmen are tortured to death. The printers of an objectionable book and those who read it, are similarly exposed to the vengeance of the law. The

direction which this state of things gives to private revenge is singular. It may be said of the Chinese that they are extremely sensitive to injuries and of a vindictive nature. To satisfy his revenge the offended person does not venture to kill his opponent, because the whole family of the assassin would be put to death; he therefore inflicts an injury on himself, to ruin his adversary. In many towns it has been deemed necessary to contract the openings of wells, to put a stop to suicides by drowning. For when anyone has committed suicide, the laws ordain that the strictest investigation shall be made into the cause. All the enemies of the suicide are arrested and put to the torture, and if the person who has committed the insult which led to the act, can be discovered, he and his whole family are executed. In case of insult therefore, a Chinese prefers killing himself rather than his opponent; since in either case he must die, but in the former contingency will have the due honors of burial, and may cherish the hope that his family will acquire the property of his adversary. Such is the fearful state of things in regard to responsibility and non-responsibility; all subjective freedom and moral concernment with an action are ignored. In the Mosaic Laws, where the distinction between *dolus, culpa,* and *casus,* is also not yet clearly recognized, there is nevertheless an asylum opened for the innocent homicide, to which he may betake himself. – There is in China no distinction in the penal code between higher and lower classes. A field-marshal of the Empire, who had very much distinguished himself, was traduced on some account, to the Emperor; and the punishment for the alleged crime, was that he should be a spy upon those who did not fulfil their duty in clearing away the snow from the streets. – Among the legal relations of the Chinese we have also to notice changes in the rights of possession and the introduction of slavery, which is connected there with it. The soil of China, in which the chief possessions of the Chinese consist, was regarded only at a late epoch as essentially the property of the State. At

that time the Ninth of all moneys from estates was allotted by law to the Emperor. At a still later epoch serfdom was established, and its enactment has been ascribed to the Emperor Shi-hoang- ti, who in the year 213 B.C., built the Great Wall; who had all the writings that recorded the ancient rights of the Chinese, burned; and who brought many independent principalities of China under his dominion. His wars caused the conquered lands to become private property, and the dwellers on these lands, serfs. In China, however, the distinction between Slavery and freedom is necessarily, not great, since all are equal before the Emperor – that is, all are alike degraded. As no honor exists, and no one has an individual right in respect of others, the consciousness of debasement predominates, and this easily passes into that of utter abandonment. With this abandonment is connected the great immorality of the Chinese. They are notorious for deceiving wherever they can. Friend deceives friend, and no one resents the attempt at deception on the part of another, if the deceit has not succeeded in its object, or comes to the knowledge of the person sought to be defrauded. Their frauds are most astutely and craftily performed, so that Europeans have to be painfully cautious in dealing with them. Their consciousness of moral abandonment shows itself also in the fact that the religion of Fo is so widely diffused; a religion which regards as the Highest and Absolute – as God – *pure Nothing;* which sets up contempt for individuality, for personal existence, as the highest perfection.

We come, then, to the consideration of the *religious* side of the Chinese Polity. In the patriarchal condition the religious exaltation of man has merely a human reference – simple morality and right-doing. The Absolute itself, is regarded partly as the abstract, simple rule of this right-doing – eternal rectitude ; partly as the *power* which is its sanction. Except in these simple aspects, all the relations of the natural world, the postulates of subjectivity – of heart and soul – are entirely ignored. The Chinese in their

patriarchal despotism need no such connection or mediation with the Highest Being; for education, the laws of morality and courtesy, and the commands and government of the Emperor embody all such connection and mediation as far as they feel the need of it. The Emperor, as he is the Supreme Head of the State, is also the Chief of its religion. Consequently, religion is in China essentially State-Religion. The distinction between it and Lamaism must be observed, since *the latter* is not developed to a State, but contains religion as a free, spiritual, disinterested consciousness. *That Chinese* religion, therefore, cannot be what *we* call religion. For to us religion means the retirement of the Spirit within itself, in contemplating its essential nature, its inmost Being. In these spheres, then, man is withdrawn from his relation to the State, and betaking himself to this retirement, is able to release himself from the power of secular government. But in China religion has not risen to this grade, for true faith is possible only where individuals can seclude themselves – can exist for themselves independently of any external compulsory power. In China the individual has no such life; – does not enjoy this independence: in any direction he is therefore dependent; in religion as well as in other things; that is, dependent on objects of nature, of which the most exalted is the material heaven. On this depend harvest, the seasons of the year, the abundance and sterility of crops. The Emperor, as crown of all – the embodiment of power – alone approaches heaven; individuals, as such, enjoy no such privilege. He it is, who presents the offerings at the four feasts; gives thanks at the head of his court, for the harvest, and invokes blessings on the sowing of the seed. This "heaven" might be taken in the sense of our term "God," as the Lord of Nature (we say, for example, "Heaven protect us!"); but such a relation is beyond the scope of Chinese thought, for here the one isolated self-consciousness is substantial being, the Emperor himself, the Supreme Power. Heaven has therefore no higher meaning than Nature. The Jesuits

indeed, yielded to Chinese notions so far as to call the Christian God, "Heaven" – "Tien"; but they were on that account accused to the Pope by other Christian Orders. The Pope consequently sent a Cardinal to China, who died there. A bishop who was subsequently despatched, enacted that instead of "Heaven," the term "Lord of Heaven" should be adopted. The relation to *Tien* is supposed to be such, that the good conduct of individuals and of the Emperor brings blessing; their transgressions on the other hand cause want and evil of all kinds. The Chinese religion involves that primitive element of magical influence over nature, inasmuch as human conduct absolutely determines the course of events. If the Emperor behaves well, prosperity cannot but ensue; Heaven must ordain prosperity. A second side of this religion is, that as the general aspect of the relation to Heaven is bound up with the person of the Emperor, he has also its more special bearings in his hands; viz., the particular well-being of individuals and provinces. These have each an appropriate *Genius* (Chen), which is subject to the Emperor, who pays adoration only to the general Power of Heaven, while the several Spirits of the natural world follow his laws. He is thus made the proper legislator for Heaven as well as for earth. To these Genii, each of which enjoys a worship peculiar to itself, certain sculptured forms are assigned. These are disgusting idols, which have not yet attained the dignity of art, because nothing spiritual is represented in them. They are therefore only terrific, frightful and negative; they keep watch – as among the Greeks do the River-Gods, the Nymphs, and Dryads – over single elements and natural objects. Each of the five Elements has its genius, distinguished by a particular color. The sovereignty of the dynasty that occupies the throne of China also depends on a Genius, and this one has a yellow color. Not less does every province and town, every mountain and river possess an appropriate Genius. All these Spirits are subordinate to the Emperor, and in the Annual Directory of the Empire are registered the

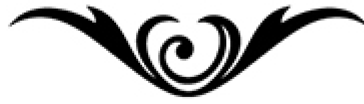
functionaries and genii to whom such or such a brook, river, etc., has been intrusted. If a mischance occurs in any part, the Genius is deposed as a Mandarin would be. The Genii have innumerable temples (in Pekin nearly 10,000) to which a multitude of priests and convents are attached. These "Bonzes" live unmarried, and in all cases of distress are applied to by the Chinese for counsel. In other respects, however, neither they nor the temples are much venerated. Lord Macartney's Embassy was even quartered in a temple – such buildings beings used as inns. The Emperor has sometimes thought fit to secularize many thousands of these convents; to compel the Bonzes to return to civil life; and to impose taxes on the estates appertaining to the foundations. The Bonzes are soothsayers and exorcists: for the Chinese are given up to boundless superstitions. This arises from the want of subjective independence, and presupposes the very opposite of freedom of Spirit. In every undertaking – *e.g.,* if the site of a house, or of a grave, etc., is to be determined – the advice of the Soothsayers as asked. In the Y-King certain lines are given, which supply fundamental forms and categories – on account of which this book is called the "Book of Fates." A certain meaning is ascribed to the combination of such lines, and prophetic announcements are deduced from this groundwork. Or a number of little sticks are thrown into the air, and the fate in question is prognosticated from the way in which they fall. What we regard as chance, as natural connection, the Chinese seek to deduce or attain by magical arts; and in this particular also, their want of spiritual religion is manifested.

With this deficiency of genuine subjectivity is connected moreover, the form which Chinese *Science* assumes. In mentioning Chinese sciences we encounter a considerable clamor about their perfection and antiquity. Approaching the subject more closely, we see that the sciences enjoy very great respect, and that they are even publicly extolled and promoted by the

Government. The Emperor himself stands at the apex of literature. A college exists whose special business it is to edit the decrees of the Emperor, with a view to their being composed in the best style; and this redaction assumes the character of an important affair of State. The Mandarins in their notifications have to study the same perfection of style, for the form is expected to correspond with the excellence of the matter. One of the highest Governmental Boards is the Academy of Sciences. The Emperor himself examines its members; they live in the palace, and perform the functions of Secretaries, Historians of the Empire, Natural Philosophers, and Geographers. Should a new law be proposed, the Academy must report upon it. By way of introduction to such report it must give the history of existing enactments; or if the law in question affects foreign countries, a description of them is required. The Emperor himself writes the prefaces to the works thus composed. Among recent Emperors *Kien-long* especially distinguished himself by his scientific acquirements. He himself wrote much, but became far more remarkable by publishing the principal works that China has produced. At the head of the commission appointed to correct the press, was a Prince of the Empire; and after the work had passed through the hands of all, it came once more back to the Emperor, who severely punished every error that had been committed. Though in one aspect the sciences appear thus pre-eminently honored and fostered, there are wanting to them on the other side that free ground of subjectivity, and that properly scientific interest, which make them a truly theoretical occupation of the mind. A free, ideal, spiritual kingdom has here no place. What may be called scientific is of a merely empirical nature, and is made absolutely subservient to the Useful on behalf of the State – its requirements and those of individuals. The nature of their Written Language is at the outset a great hindrance to the development of the sciences. Rather, conversely, because a true scientific interest does not exist, the Chinese

have acquired no better instrument for representing and imparting thought. They have, as is well known, beside a Spoken Language, a *Written Language;* which does not express, as our does, individual sounds – does not present the spoken words to the eye, but represents the ideas themselves by signs. This appears at first sight a great advantage, and has gained the suffrages of many great men – among others, of Leibnitz. In reality, it is anything but such. For if we consider in the first place, the effect of such a mode of writing on the Spoken Language, we shall find this among the Chinese very imperfect, on account of that separation. For our Spoken Language is matured to distinctness chiefly through the necessity of finding signs for each single sound, which latter, by reading, we learn to express distinctly. The Chinese, to whom such a means of orthoepic development is wanting, do not mature the modifications of sounds in their language to distinct articulations capable of being represented by letters and syllables. Their Spoken Language consists of an inconsiderable number of monosyllabic words, which are used with more than one signification. The sole methods of denoting distinctions of meaning are the connection, the accent, and the pronunciation – quicker or slower, softer or louder. The ears of the Chinese have become very sensible to such distinctions. Thus I find that the word *Po* has eleven different meanings according to the tone: denoting "glass" – "to boil" – "to winnow wheat" – "to cleave asunder" – "to water" – "to prepare" – "an old woman" – "a slave" – "a liberal man" – "a wise person" – "a little." – As to their Written Language, I will specify only the obstacles which it presents to the advance of the sciences. Our Written Language is very simple for a learner, as we analyze our Spoken Language into about twenty-five articulations, by which analysis, speech is rendered definite, the multitude of possible sounds is limited, and obscure intermediate sounds are banished: we have to learn only these signs and their combinations. Instead of twenty-five signs of this sort, the Chinese

have many thousands to learn. The number necessary for use is reckoned at 9,353, or even 10,516, if we add those recently introduced; and the number of characters generally, for ideas and their combinations as they are presented in books, amounts to from 80,000 to 90,000. As to the sciences themselves, *History* among the Chinese comprehends the bare and definite facts, without any opinion or reasoning upon them. In the same way their *Jurisprudence* gives only fixed laws, and their *Ethics* only determinate duties, without raising the question of a subjective foundation for them. The Chinese have, however, in addition to other sciences, a *Philosophy,* whose elementary principles are of great antiquity, since the *Y-King* – the *Book of Fates* – treats of Origination and Destruction. In this book are found the purely abstract ideas of Unity and Duality; the Philosophy of the Chinese appears therefore to proceed from the same fundamental ideas as that of Pythagoras. The fundamental principle recognized is *Reason – Tao;* that essence lying at the basis of the whole, which effects everything. To become acquainted with its forms is regarded among the Chinese also as the highest science; yet this has no connection with the educational pursuits which more nearly concern the State. The works of Lao-tse, and especially his work "Tao-te-King," are celebrated. Confucius visited this philosopher in the sixth century before Christ, to testify his reverence for him. Although every Chinaman is at liberty to study these philosophical works, a particular sect, calling itself *Tao-tse*, "Honorers of Reason," makes this study its special business. Those who compose it are isolated from civil life; and there is much that is enthusiastic and mystic intermingled with their views. They believe, for instance, that he who is acquainted with Reason, possesses an instrument of universal power, which may be regarded as all-powerful, and which communicates a supernatural might; so that the possessor is enabled by it to exalt himself to Heaven, and is not subject to death (much the same as the universal Elixir of Life once talked of among



us). With the works of Confucius we have become more intimately acquainted. To him, China owes the publication of the *Kings,* and many original works on Morality besides, which form the basis of the customs and conduct of the Chinese. In the principal work of Confucius, which has been translated into English, are found correct moral apophthegms; but there is a circumlocution, a reflex character, and circuitousness in the thought, which prevents it from rising above mediocrity. As to the other sciences, they are not regarded as such, but rather as branches of knowledge for the behoof of practical ends. The Chinese are far behind in Mathematics, Physics, and Astronomy, notwithstanding their quondam reputation in regard to them. They knew many things at a time when Europeans had not discovered them, but they have not understood how to apply their knowledge: as *e.g.* the Magnet, and the Art of Printing. But they have made no advance in the application of these discoveries. In the latter, for instance, they continue to engrave the letters in wooden blocks and then print them off: they know nothing of movable types. Gunpowder, too, they pretended to have invented before the Europeans; but the Jesuits were obliged to found their first cannon. As to Mathematics, they understand well enough how to reckon, but the higher aspect of the science is unknown. The Chinese also have long passed as great astronomers. *Laplace* has investigated their acquisitions in this department, and discovered that they possess some ancient accounts and notices of Lunar and Solar Eclipses; but these certainly do not constitute a *science.* The notices in question are, moreover, so indefinite, that they cannot properly be put in the category of knowledge. In the Shu-King, *e.g.,* we have two eclipses of the sun mentioned in the space of 1,500 years. The best evidence of the state of Astronomy among the Chinese, is the fact that for many hundred years the Chinese calendars have been made by Europeans. In earlier times, when Chinese astronomers continued to compose the calendar, false

announcements of lunar and solar eclipses often occurred, entailing the execution of the authors. The telescopes which the Chinese have received as presents from the Europeans, are set up for ornament; but they have not an idea how to make further use of them. Medicine, too, is studied by the Chinese, but only empirically; and the grossest superstition is connected with its practice. The Chinese have as a general characteristic, a remarkable skill in imitation, which is exercised not merely in daily life, but also in art. They have not yet succeeded in representing the beautiful, as beautiful; for in their painting, perspective and shadow are wanting. And although a Chinese painter copies European pictures (as the Chinese do everything else) *correctly;* although he observes accurately how many scales a carp has; how many indentations there are in the leaves of a tree; what is the form of various trees, and how the branches bend; – the Exalted, the Ideal and Beautiful is not the domain of his art and skill. The Chinese are, on the other hand, too proud to learn anything from Europeans, although they must often recognize their superiority. A merchant in Canton had a European ship built, but at the command of the Governor it was immediately destroyed. The Europeans are treated as beggars, because they are compelled to leave their home, and seek for support elsewhere than in their own country. Besides, the Europeans, just because of their intelligence, have not yet been able to imitate the superficial and perfectly natural cleverness of the Chinese. Their preparation of varnishes – their working of metals, and especially their art of casting them extremely thin – their porcelain manufacture and many other things, have not yet been completely mastered by Europeans.

This is the character of the Chinese people in its various aspects. Its distinguishing feature is, that everything which belongs to Spirit – unconstrained morality, in practice and theory, Heart, inward Religion, Science and Art properly socalled – is alien to it. The Emperor always

speaks with majesty and paternal kindness and tenderness to the people; who, however, cherish the meanest opinion of themselves, and believe that they are born only to drag the car of Imperial Power. The burden which presses them to the ground, seems to them to be their inevitable destiny; and it appears nothing terrible to them to sell themselves as slaves, and to eat the bitter bread of slavery. Suicide, the result of revenge, and the exposure of children, as a common, even daily occurrence, show the little respect in which they hold themselves individually, and humanity in general. And though there is no distinction conferred by birth, and everyone can attain the highest dignity, this very equality testifies to no triumphant assertion of the worth of the inner man, but a servile consciousness – one which has not yet matured itself so far as to recognize distinctions.

SECTION II: INDIA

INDIA, LIKE CHINA, is a phenomenon antique as well as modern; one which has remained stationary and fixed, and has received a most perfect home-sprung development. It has always been the land of imaginative aspiration, and appears to us still as a Fairy region, an enchanted World. In contrast with the Chinese State, which presents only the most prosaic Understanding, India is the region of phantasy and sensibility. The point of advance in principle which it exhibits to us may be generally stated as follows: – In China the patriarchal principle rules a people in a condition of nonage, the part of whose moral resolution is occupied by the regulating law, and the moral oversight of the Emperor. Now it is the interest of Spirit that *external* conditions should become *internal* ones; that the natural and the spiritual world should be recognized in the subjective aspect belonging to intelligence; by which process the unity of subjectivity and [positive] Being generally – or the Idealism of Existence – is established. This Idealism, then, is found in India, but only as an Idealism of imagination, without distinct conceptions; – one which does indeed free existence from Beginning and Matter [liberates it from temporal limitations and gross materiality], but changes everything into the merely Imaginative; for although the latter appears interwoven with definite conceptions and Thought presents itself as an occasional concomitant, this happens only through accidental combination. Since, however, it is the abstract and absolute Thought itself that enters into these dreams as their material, we may say that Absolute Being is presented here as in the ecstatic state of a dreaming condition. For we have not the dreaming of an actual Individual,

possessing distinct personality, and simply unfettering the latter from limitation, but we have the dreaming of the unlimited absolute Spirit.

There is a beauty of a peculiar kind in women, in which their countenance presents a transparency of skin, a light and lovely roseate hue, which is unlike the complexion of mere health and vital vigor – a more refined bloom, breathed, as it were, by the soul within – and in which the features, the light of the eye, the position of the mouth, appear soft, yielding, and relaxed. This almost unearthly beauty is perceived in women in those days which immediately succeed child-birth; when freedom from the burden of pregnancy and the pains of travail is added to the joy of soul that welcomes the gift of a beloved infant. A similar tone of beauty is seen also in women during the magical somnambulic sleep, connecting them with a world of superterrestrial beauty. A great artist (Schoreel) has moreover given this tone to the dying Mary, whose spirit is already rising to the regions of the blessed, but once more, as it were, lights up her dying countenance for a farewell kiss. Such a beauty we find also in its loveliest form in the Indian World; a beauty of enervation in which all that is rough, rigid, and contradictory is dissolved, and we have only the soul in a state of emotion – a soul, however, in which the death of free self-reliant Spirit is perceptible. For should we approach the charm of this Flower-life – a charm rich in imagination and genius – in which its whole environment and all its relations are permeated by the rose-breath of the Soul, and the World is transformed into a Garden of Love – should we look at it more closely, and examine it in the light of Human Dignity and Freedom – the more attractive the first sight of it had been, so much the more unworthy shall we ultimately find it in every respect.

The character of Spirit in a state of Dream, as the generic principle of the Hindoo Nature, must be further defined. In a dream, the individual ceases to be conscious of self or *such,* in contradistinction from objective existences.

When awake, I exist for myself, and the rest of creation is an external, fixed objectivity, as I myself am for it. As external, the rest of existence expands itself to a rationally connected whole; a system of relations, in which my individual being is itself a member – an individual being united with that totality. This is the sphere of *Understanding.* In the state of dreaming, on the contrary, this separation is suspended. Spirit has ceased to exist for itself in contrast with alien existence, and thus the separation of the external and individual dissolves before its universality – its *essence.* The dreaming Indian is therefore all that we call finite and individual; and, at the same time – as infinitely universal and unlimited – a something intrinsically divine. The Indian view of things is a Universal Pantheism, a Pantheism, however, of Imagination, not of Thought. One substance pervades the Whole of things, and all individualizations are directly vitalized and animated into particular Powers. The sensuous matter and content are in each case simply and in the rough taken up, and carried over into the sphere of the Universal and Immeasurable. It is not liberated by the free power of Spirit into a beautiful form, and idealized in the Spirit, so that the sensuous might be a merely subservient and compliant expression of the spiritual; but [the sensuous object itself] is expanded into the immeasurable and undefined, and the Divine is thereby made bizarre, confused, and ridiculous. These dreams are not mere fables – a play of the imagination, in which the soul only revelled in fantastic gambols: it is lost in them; hurried to and fro by these reveries, as by something that exists really and seriously for it. It is delivered over to these limited objects as to its Lords and Gods. Everything, therefore – Sun, Moon, Stars, the Ganges, the Indus, Beasts, Flowers – everything is a God to it. And while, in this deification, the finite loses its consistency and substantiality, intelligent conception of it is impossible. Conversely the Divine, regarded as essentially changeable and unfixed, is also by the base form which it assumes, defiled and made absurd. In this

universal deification of all finite existence, and consequent degradation of the Divine, the idea of Theanthropy, the incarnation of God, is not a particularly important conception. The parrot, the cow, the ape, etc., are likewise incarnations of God, yet are not therefore elevated above their nature. The Divine is not individualized to a subject, to concrete Spirit, but degraded to vulgarity and senselessness. This gives us a general idea of the Indian view of the Universe. *Things* are as much stripped of rationality, of finite consistent stability of cause and effect, as *man* is of the steadfastness of free individuality, of personality, and freedom. Externally, India sustains manifold relations to the History of the World. In recent times the discovery has been made, that the Sanscrit lies at the foundation of all those further developments which form the languages of Europe; *e.g.,* the Greek, Latin, German. India, moreover, was the centre of emigration for all the western world; but this external historical relation is to be regarded rather as a merely physical diffusion of peoples from this point. Although in India the elements of further developments might be discovered, and although we could find traces of their being transmitted to the West, this transmission has been nevertheless so abstract [so superficial], that that which among later peoples attracts our interest, is not anything derived from India, but rather something concrete, which they themselves have formed, and in regard to which they have done their best to forget Indian elements of culture. The spread of Indian culture is prehistorical, for History *is* limited to that which makes an essential epoch in the development of Spirit. On the whole, the diffusion of Indian culture is only a dumb, deedless expansion; that is, it presents no political action. The people of India have achieved no foreign conquests, but have been on every occasion vanquished themselves. And as in this silent way, Northern India has been a centre of emigration, productive of merely physical diffusion, India as a *Land of Desire* forms an essential element in General History. From the most ancient times

downwards, all nations have directed their wishes and longings to gaining access to the treasures of this land of marvels, the most costly which the Earth presents; treasures of Nature – pearls, diamonds, perfumes, rose-essences, elephants, lions, etc. – as also treasures of wisdom. The way by which these treasures have passed to the West, has at all times been a matter of World- historical importance, bound up with the fate of nations. Those wishes have been realized; this Land of Desire has been attained ; there is scarcely any great nation of the East, nor of the Modern European West, that has not gained for itself a smaller or larger portion of it. In the old world, Alexander the Great was the first to penetrate by land to India, but even he only just touched it. The Europeans of the modern world have been able to enter into direct connection with this land of marvels only circuitously from the other side; and by way of the sea, which, as has been said, is the general uniter of countries. The English, or rather the East India Company, are the lords of the land; for it is the necessary fate of Asiatic Empires to be subjected to Europeans; and China will, some day or other, be obliged to submit to this fate. The number of inhabitants is near 200,000,000, of whom from 100,000,000 to 112,000,000 are directly subject to the English. The Princes who are not immediately subject to them have English Agents at their Courts, and English troops in their pay. Since the country of the Mahrattas was conquered by the English, no part of India has asserted its independence of their sway. They have already gained a footing in the Burman Empire, and passed the Brahmaputra, which bounds India on the east.

India Proper is the country which the English divide into two large sections: the *Deccan* – the great peninsula which has the Bay of Bengal on the east, and the Indian Sea on the west – and *Hindostan,* formed by the valley of the Ganges, and extending in the direction of Persia. To the northeast, Hindostan is bordered by the Himalaya, which has been

ascertained by Europeans to be the highest mountain range in the world, for its summits are about 26,000 feet above the level of the sea. On the other side of the mountains the level again declines; the dominion of the Chinese extends to that point, and when the English wished to go to Lassa to the Dalai-Lama, they were prevented by the Chinese. Towards the west of India flows the Indus, in which the five rivers are united, which are called the *Pentjâb* (Punjab), into which Alexander the Great penetrated. The dominion of the English does not extend to the Indus; the sect of the Sikhs inhabits that district, whose constitution is thoroughly democratic, and who have broken off from the Indian as well as from the Mohammedan religion, and occupy an intermediate ground – acknowledging only one Supreme Being. They are a powerful nation, and have reduced to subjection Cabul and Cashmere. Besides these there dwell along the Indus genuine Indian tribes of the Warrior-Caste. Between the Indus and its twin-brother, the Ganges, are great plains. The Ganges, on the other hand, forms large Kingdoms around it, in which the sciences have been so highly developed, that the countries around the Ganges enjoy a still greater reputation than those around the Indus. The Kingdom of Bengal is especially flourishing. The Nerbuddah forms the boundary between the Deccan and Hindostan. The peninsula of the Deccan presents a far greater variety than Hindostan, and its rivers possess almost as great a sanctity as the Indus and the Ganges – which latter has become a general name for all the rivers in India, as the River kat exochn. We call the inhabitants of the great country which we have now to consider *Indians,* from the river *Indus* (the English call them *Hindoos*). They themselves have never given a name to the whole, for it has never become one Empire, and yet we consider it as such.

With regard to the *political* life of the Indians, we must first consider the advance it presents in contrast with China. In China there prevailed an equality among all the individuals composing the empire; consequently all

government was absorbed in its centre, the Emperor, so that individual members could not attain to independence and subjective freedom. The next degree in advance of this Unity is Difference, maintaining its independence against the all-subduing power of Unity. An organic life requires in the first place One Soul, and in the second place, a divergence into differences, which become organic members, and in their several offices develop themselves to a complete system; in such a way, however, that their activity reconstitutes that one soul. This freedom of separation is wanting in China. The deficiency is that diversities cannot attain to independent existence. In this respect, the essential advance is made in India, viz.: that independent members ramify from the unity of despotic power. Yet the distinctions which these imply are referred to Nature. Instead of stimulating the activity of a soul as their centre of union, and spontaneously realizing that soul – as is the case in organic life – they petrify and become rigid, and by their stereotyped character condemn the Indian people to the most degrading spiritual serfdom. The distinctions in question are the *Castes.* In every rational State there are distinctions which must manifest themselves. Individuals must arrive at subjective freedom, and in doing so, give an objective form to these diversities. But Indian culture has not attained to a recognition of freedom and inward morality; the distinctions which prevail are only those of occupations, and civil conditions. In a free state also, such diversities give rise to particular classes, so combined, however, that their members can maintain their individuality. In India we have only a division in masses – a division, however, that influences the whole political life and the religious consciousness. The distinctions of class, like that [rigid] Unity in China, remain consequently on the same original grade of *substantiality, i.e.,* they are not the result of the free subjectivity of individuals. Examining the idea of a State and its various functions, we recognize the first essential function as that whose scope is the absolutely Universal; of which man

becomes conscious first in Religion, then in Science. God, the Divine [tw qeion] is the absolutely Universal. The highest class therefore will be the one by which the Divine is presented and brought to bear on the community – the class of *Brahmins.* The second element or class, will represent subjective power and valor. Such power must assert itself, in order that the whole may stand its ground, and retain its integrity against other such totalities or states. This class is that of the Warriors and Governors – the *Cshatriyas;* although Brahmins often become governors. The third order of occupation recognized is that which is concerned with the specialities of life – the satisfying of its necessities – and comprehends agriculture, crafts and trade; the class of the *Vaisyas.* Lastly, the fourth element is the class of service, the mere instrument for the comfort of others, whose business it is to work for others for wages affording a scanty subsistence – the caste of *Sudras.* This servile class – properly speaking – constitutes no special organic class in the state, because its members only serve individuals: their occupations are therefore dispersed among them and are consequently attached to that of the previously mentioned castes. – Against the existence of "classes" generally, an objection has been brought – especially in modern times – drawn from the consideration of the State in its "aspect" of abstract equity. But equality in civil life is something absolutely impossible; for individual distinctions of sex and age will always assert themselves; and even if an equal share in the government is accorded to all citizens, women and children are immediately passed by, and remain excluded. The distinction between poverty and riches, the influence of skill and talent, can be as little ignored – utterly refuting those abstract assertions. But while this principle leads us to put up with variety of occupations, and distinction of the classes to which they are intrusted, we are met here in India by the peculiar circumstance that the individual belongs to such a class essentially by *birth,* and is bound to it for life. All the concrete vitality that makes its

appearance sinks back into death. A chain binds down the life that was just upon the point of breaking forth. The promise of freedom which these distinctions hold out is therewith completely nullified. What birth has separated mere arbitrary choice has no right to join together again: therefore, the castes preserving distinctness from their very origin, are presumed not to be mixed or united by marriage. Yet even Arrian (Ind. 11) reckoned seven castes, and in later times more than thirty have been made out; which, notwithstanding all obstacles, have arisen from the union of the various classes. Polygamy necessarily tends to this. A Brahmin, *e.g.,* is allowed three wives from the three other castes, provided he has first taken one from his own. The offspring of such mixtures originally belonged to no caste, but one of the kings invented a method of classifying these casteless persons, which involved also the commencement of arts and manufactures. The children in question were assigned to particular employments; one section became weavers, another wrought in iron, and thus different classes arose from these different occupations. The highest of these mixed castes consists of those who are born from the marriage of a Brahmin with a wife of the Warrior caste; the lowest is that of the *Chandâlas,* who have to remove corpses, to execute criminals, and to perform impure offices generally. The members of this caste are excommunicated and detested; and are obliged to live separate and far from association with others. The Chandâlas are obliged to move out of the way for their superiors, and a Brahmin may knock down any that neglect to do so. If a Chandâla drinks out of a pond it is defiled, and requires to be consecrated afresh. We must next consider the relative position of these castes. Their origin is referred to a myth, which tells us that the Brahmin caste proceeded from Brahma’s mouth; the Warrior caste from his arms; the industrial classes from his loins; the servile caste from his foot. Many historians have set up the hypothesis that the Brahmins originally formed a separate sacerdotal nation,

and this fable is especially countenanced by the Brahmins themselves. A people consisting of priests alone is, assuredly, the greatest absurdity, for we know *a priori,* that a distinction of classes can exist only within a people; in every nation the various occupations of life must present themselves, for they belong to the objectivity of Spirit. *One* class necessarily supposes another, and the rise of castes generally, is only a result of the united life of a nation. A nation of priests cannot exist without agriculturists and soldiers. Classes cannot be brought together from without; they are developed only from within. They come forth from the interior of national life, and not conversely. But that these distinctions are here attributed to Nature, is a necessary result of the Idea which the East embodies. For while the individual ought properly to be empowered to choose his occupation, in the East, on the contrary, internal subjectivity is not yet recognized as independent; and if distinction obtrude themselves, their recognition is accompanied by the belief that the individual does not choose his particular position for himself, but receives it from Nature. In China the people are dependent – without distinction of classes – on the laws and moral decision of the Emperor; consequently on a human will. Plato, in his Republic, assigns the arrangement in different classes with a view to various occupations, to the choice of the governing body. Here, therefore, a moral, a spiritual power is the arbiter. In India, Nature is this governing power. But this natural destiny need not have led to that degree of degradation which we observe here, if the distinctions had been limited to occupation with what is earthly – to forms of objective Spirit. In the feudalism of mediaeval times, individuals were also confined to a certain station in life; but for all there was a Higher Being, superior to the most exalted earthly dignity, and admission to holy orders was open to all. This is the grand distinction, that here Religion holds the same position towards *all;* that, although the son of a mechanic becomes a mechanic, the son of a peasant a peasant, and free

choice is often limited by many restrictive circumstances, the *religious element* stands in the same relation to all, and all are invested with an absolute value by religion. In India the direct contrary is the case. Another distinction between the classes of society as they exist in the Christian world and those in Hindostan is the moral dignity which exists among us in every class, constituting that which man must possess in and through himself. In this respect the higher classes are equal to the lower; and while religion is the higher sphere in which all sun themselves, equality before the law – rights of person and of property – are gained for every class. But by the fact that in India, as already observed, differences extend not only to the objectivity of Spirit, but also to its absolute subjectivity, and thus exhaust all its relations – neither morality, nor justice, nor religiosity is to be found.

Every caste has its especial duties and rights. Duties and rights, therefore, are not recognized as pertaining to mankind generally, but as those of a particular caste. While we say, "Bravery is a virtue," the Hindoos say, on the contrary, "Bravery is the virtue of the *Cshatryas*." Humanity generally, human duty and human feeling do not manifest themselves; we find only duties assigned to the several castes. Everything is petrified into these distinctions, and over this petrifaction a capricious destiny holds sway. Morality and human dignity are unknown; evil passions have their full swing; the Spirit wanders into the Dream-World, and the highest state is Annihilation.

To gain a more accurate idea of what the *Brahmins* are, and in what the Brahminical dignity consists, we must investigate the Hindoo religion and the conceptions it involves, to which we shall have to return further on; for the respective rights of castes have their basis in a religious relation. *Brahma* (neuter) is the Supreme in Religion, but there are besides chief divinities *Brahmâ* (masc.) *Vishnu* or *Krishna* – incarnate in infinitely diverse forms – and *Siva.* These form a connected Trinity. Brahma is the

highest; but Vishnu or Krishna, Siva, the Sun moreover, the Air, etc., are also Brahm, *i.e.,* Substantial Unity. To Brahm itself no sacrifices are offered; it is not honored; but prayers are presented to all other idols. Brahm itself is the Substantial Unity of All. The highest religious position of man, therefore is, being exalted to Brahm. If a Brahmin is asked what Brahm is, he answers: When I fall back within myself, and close all external senses, and say *dm* to myself, that is Brahm. Abstract unity with God is realized in this abstraction from humanity. An abstraction of this kind may in some cases leave everything else unchanged, as does devotional feeling, momentarily excited. But among the Hindoos it holds a negative position towards all that is concrete; and the highest state is supposed to be this exaltation, by which the Hindoo raises himself to deity. The Brahmins, in virtue of their birth, are already in possession of the Divine. The distinction of castes involves, therefore, a distinction between present deities and mere limited mortals. The other castes may likewise become partakers in a *Regeneration*; but they must subject themselves to immense self-denial, torture and penance. Contempt of life, and of living humanity, is the chief feature in this ascesis. A large number of the non-Brahminical population strive to attain *Regeneration.* They are called Yogis. An Englishman who, on a journey to Thibet to visit the Dalai-Lama, met such a Yogi, gives the following account: The Yogi was already on the second grade in his ascent to Brahminical dignity. He had passed the first grade by remaining for twelve years on his legs, without ever sitting or lying down. At first he had bound himself fast to a tree with a rope, until he had accustomed himself to sleep standing. The second grade required him to keep his hands clasped together over his head for twelve years in succession. Already his nails had almost grown into his hands. The third grade is not always passed through in the same way; generally the Yogi has to spend a day between *five fires,* that is, between four fires occupying the four quarters of heaven, and the

Sun. He must then swing backwards and forwards over the fire, a ceremony occupying three hours and three-quarters.

Englishmen present at an act of this kind, say that in half an hour the blood streamed forth from every part of the devotee's body; he was taken down and presently died. If this trial is also surmounted, the aspirant is finally buried alive, that is put into the ground in an upright position and quite covered over with soil; after three hours and three-quarters he is drawn out, and if he lives, he is supposed to have at last attained the spiritual power of a Brahmin. Thus only by such negation of his existence does anyone attain Brahminical power. In its highest degree this negation consists in a sort of hazy consciousness of having attained perfect mental immobility – the annihilation of all emotion and all volition; – a condition which is regarded as the highest among the Buddhists also. However pusillanimous and effeminate the Hindoos may be in other respects, it is evident how little they hesitate to sacrifice themselves to the Highest – to Annihilation. Another instance of the same is the fact of wives burning themselves after the death of their husbands. Should a woman contravene this traditional usage, she would be severed from society, and perish in solitude. An Englishman states that he also saw a woman burn herself because she had lost her child. He did all that he could to divert her away from her purpose; at last he applied to her husband who was standing by, but he showed himself perfectly indifferent, as *he had more wives at home.* Sometimes twenty women are seen throwing themselves at once into the Ganges, and on the Himalaya range an English traveller found three women seeking the source of the Ganges, in order to put an end to their life in this holy river. At a religious festival in the celebrated temple of Juggernaut in Orissa, on the Bay of Bengal, where millions of Hindoos assemble, the image of the god Vishnu is drawn in procession on a car: about five hundred men set it in motion, and many fling themselves down before its wheels to

be crushed to pieces. The whole seashore is already strewed with the bodies of persons who have thus immolated themselves. Infanticide is also very common in India. Mothers throw their children into the Ganges, or let them pine away under the rays of the sun. The morality which is involved in respect for human life is not found among the Hindoos. There are besides those already mentioned, infinite modifications of the same principle of conduct, all pointing to annihilation. This, *e.g.,* is the leading principle of the Gymnosophists, as the Greeks called them. Naked Fakirs wander about without any occupation, like the mendicant friars of the Catholic church; live on the alms of others, and make it their aim to reach the highest degree of abstraction – the perfect deadening of consciousness; a point from which the transition to physical death is no great step. This elevation which others can only attain by toilsome labor is, as already stated, the birthright of the Brahmins. The Hindoo of another caste, must, therefore, reverence the Brahmin as a divinity; fall down before him, and say to him: "Thou art God." And this elevation cannot have anything to do with moral conduct, but – inasmuch as all internal morality is absent – is rather dependent on a farrago of observances relating to the merest externalities and trivialities of existence. Human life, it is said, ought to be a perpetual Worship of God. It is evident how hollow such general aphorisms are, when we consider the concrete forms which they may assume. They require another, a further qualification, if they are to have a meaning. The Brahmins are a present deity, but their spirituality has not yet been reflected inwards in contrast with Nature; and thus that which is purely indifferent is treated as of absolute importance. The employment of the Brahmins consists principally in the reading of the Vêdas: they only have a right to read them. Were a Sudra to read the Vêdas, or to hear them read, he would be severely punished, and burning oil must be poured into his ears. The external observances binding on the Brahmins are prodigiously numerous, and the

Laws of Manu treat of them as the most essential part of duty. The Brahmin must rest on one particular foot in rising, then wash in a river; his hair and nails must be cut in neat curves, his whole body purified, his garments white; in his hand must be a staff of a specified kind; in his ears a golden earring. If the Brahmin meets a man of an inferior caste, he must turn back and purify himself. He has also to read in the Vêdas, in various ways: each word separately, or doubling them alternately, or backwards. He may not look to the sun when rising or setting, or when overcast by clouds or reflected in the water. He is forbidden to step over a rope to which a calf is fastened, or to go out when it rains. He may not look at his wife when she eats, sneezes, gapes, or is quietly seated. At the midday meal he may only have one garment on, in bathing never be quite naked. How minute these directions are may be especially judged of from the observances binding on the Brahmins in regard to satisfying the calls of nature. This is forbidden to them in a great thoroughfare, on ashes, on ploughed land, on a hill, a nest of white ants, on wood destined for fuel, in a ditch, walking or standing, on the bank of a river, etc. At such a time they may not look at the sun, at water, or at animals. By day they should keep their face generally directed to the north, but by night to the south; only in the shade are they allowed to turn to which quarter they like. It is forbidden to everyone who desires a long life to step on potsherds, cotton seeds, ashes, or sheaves of corn, or his urine. In the episode Nala, in the poem of Mahabharata, we have a story of a virgin who in her 21st year – the age in which the maidens themselves have a right to choose a husband – makes a selection from among her wooers. There are five of them; but the maiden remarks that four of them do not stand firmly on their feet, and thence infers correctly that they are Gods. She therefore chooses the fifth, who is a veritable man. But besides the four despised divinities there are two malevolent ones, whom her choice had not favored, and who on that account wish for revenge. They therefore keep a strict

watch on the husband of their beloved in every step and act of life, with the design of inflicting injury upon him if he commits a misdemeanor. The persecuted husband does nothing that can be brought against him, until at last he is so incautious as to step on his urine. The Genius has now an advantage over him; he afflicts him with a passion for gambling, and so plunges him into the abyss.

While, on the one hand, the Brahmins are subject to these strict limitations and rules, on the other hand their life is sacred; it cannot answer for crimes of any kind; and their property is equally secure from being attacked. The severest penalty which the ruler can inflict upon them amounts to nothing more than banishment. The English wished to introduce trial by jury into India – the jury to consist half of Europeans, half of Hindoos – and submitted to the natives, whose wishes on the subject were consulted, the powers with which the panel would be intrusted. The Hindoos were for making a number of exceptions and limitations. They said, among other things, that they could not consent that a Brahmin should be condemned to death; not to mention other objections, *e.g.,* that looking at and examining a corpse was out of the question. Although in the case of a Warrior the rate of interest may be as high as three per cent, in that of a Vaisya four per cent, a Brahmin is never required to pay more than two per cent. The Brahmin possesses such a power, that Heaven's lightning would strike the King who ventured to lay hands on him or his property. For the meanest Brahmin is so far exalted above the King, that he would be polluted by conversing with him, and would be dishonored by his daughters choosing a prince in marriage. In Manu's Code it is said: "If anyone presumes to teach a Brahmin his duty, the King must order that hot oil be poured into the ears and mouth of such an instructor. If one who is only once-born, loads one who is twice-born with reproaches, a red hot iron bar ten inches long shall be thrust into his mouth." On the other hand a Sudra is

condemned to have a red hot iron thrust into him from behind if he rest himself in the chair of a Brahmin, and to have his foot or his hand hewed off if he pushes against a Brahmin with hands or feet. It is even permitted to give false testimony, and to lie before a Court of Justice, if a Brahmin can be thereby freed from condemnation. As the Brahmins enjoy advantages over the other Castes, the latter in their turn have privileges according to precedence, over their inferiors. If a Sudra is defiled by contact with a Pariah, he has the right to knock him down on the spot. Humanity on the part of a higher Caste towards an inferior one is entirely forbidden, and a Brahmin would never think of assisting a member of another Caste, even when in danger. The other Castes deem it a great honor when a Brahmin takes their daughters as his wives – a thing however, which is permitted him, as already stated, only when he has already taken one from his own Caste. Thence arises the freedom the Brahmins enjoy in getting wives. At the great religious festivals they go among the people and choose those that please them best; but they also repudiate them at pleasure.

If a Brahmin or a member of any other Caste transgresses the above cited laws and precepts, he is himself excluded from his caste, and in order to be received back again, he must have a hook bored through the hips, and be swung repeatedly backwards and forwards in the air. There are also other forms of restoration. A Rajah who thought himself injured by an English Governor sent two Brahmins to England to detail his grievances. But the Hindoos are forbidden to cross the sea, and these envoys on their return were declared excommunicated from their caste, and in order to be restored to it, they had to be born again from a golden cow. The imposition was so far lightened, that only those parts of the cow out of which they had to creep were obliged to be golden; the rest might consist of wood. These various usages and religious observances to which every Caste *is* subject have occasioned great perplexity to the English, especially in enlisting soldiers.

At first these were taken from the Sudra-Caste, which is not bound to observe so many ceremonies; but nothing could be done with them, they therefore betook themselves to the Cshatriya class. These however have an immense number of regulations to observe – they may not eat meat, touch a dead body, drink out of a pool in which cattle or Europeans have drunk, not eat what others have cooked, etc. Each Hindoo assumes one definite occupation, and that only, so that one must have an infinity of servants; – a Lieutenant has *thirty,* a Major *sixty.* Thus every Caste has its own duties; the lower the Caste, the less it has to observe; and as each individual has his position assigned by birth, beyond this fixed arrangement everything is governed by caprice and force. In the Code of Manu punishments increase in proportion to the inferiority of Castes, and there is a distinction in other respects. If a man of a higher Caste brings an accusation against an inferior without proof, the former is not punished; if the converse occurs, the punishment is very severe. Cases of theft are exceptional; in this case the higher the Caste the heavier is the penalty.

In respect to property the Brahmins have a great advantage, for they pay no taxes. The prince receives half the income from the lands of others; the remainder has to suffice for the cost of cultivation and the support of the laborers. It is an extremely important question, whether the cultivated land in India is recognized as belonging to the cultivator, or belongs to a so-called manorial proprietor. The English themselves have had great difficulty in establishing a clear understanding about it. For when they conquered Bengal, it was of great importance to them, to determine the mode in which taxes were to be raised on property, and they had to ascertain whether these should be imposed on the tenant cultivators or the lord of the soil. They imposed the tribute on the latter; but the result was that the proprietors acted in the most arbitrary manner: drove away the tenant cultivators, and declaring that such or such an amount of land was not under cultivation,

gained an abatement of tribute. They then took back the expelled cultivators as day-laborers, at a low rate of wages, and had the land cultivated on their own behalf. The whole income belonging to every village is, as already stated, divided into two parts, of which one belongs to the Rajah, the other to the cultivators; but proportionate shares are also received by the Provost of the place, the Judge, the Water-Surveyor, the Brahmin who superintends religious worship, the Astrologer (who is also a Brahmin, and announces the days of good and ill omen), the Smith, the Carpenter, the Potter, the Washerman, the Barber, the Physician, the Dancing Girls, the Musician, the Poet. This arrangement is fixed and immutable, and subject to no one's will. *All political* revolutions, therefore, are matters of indifference to the common Hindoo, for his lot is unchanged.

The view given of the relation of castes leads directly to the subject of Religion. For the claims of caste are, as already remarked, not merely secular, but essentially religious, and the Brahmins in their exalted dignity are the very gods bodily present. In the laws of Manu it is said: "Let the King, even in extreme necessity, beware of exciting the Brahmins against him; for they can destroy him with their power – they who create Fire, Sun, Moon, etc." They are servants neither of God nor of his People, but are God himself to the other Castes – a position of things which constitutes the perverted character of the Hindoo mind. The dreaming Unity of Spirit and nature, which involves a monstrous bewilderment in regard to all phenomena and relations, we have already recognized as the principle of the Hindoo Spirit. The Hindoo Mythology is therefore only a wild extravagance of Fancy, in which nothing has a settled form; which takes us abruptly from the Meanest to the Highest, from the most sublime to the most disgusting and trivial. Thus it is also difficult to discover what the Hindoos understand by Brahm. We are apt to take our conception of Supreme Divinity – the One – the Creator of Heaven and Earth – and apply it to the Indian Brahm.

Brahma is distinct from Brahm – the former constituting one personality in contrasted relation to Vishnu and Siva. Many therefore call the Supreme Existence who is over the first mentioned deity, *Para-brahma.* The English have taken a good deal of trouble to find out what Brahm properly is. Wilford has asserted that Hindoo conceptions recognize two Heavens: the first, the earthly paradise, the second, Heaven in a spiritual sense. To attain them, two different modes of worship are supposed to be required. The one involves external ceremonies, Idol- Worship; the other requires that the Supreme Being should be honored in spirit. Sacrifices, purifications, pilgrimages are not needed in the latter. This authority states moreover that there are few Hindoos ready to pursue the second *way,* because they cannot understand in what the pleasure of the second heaven consists, and that if one asks a Hindoo whether he worships Idols, every one says "Yes!" but to the question, "Do you worship the Supreme Being? " every one answers "No." If the further question is put, " What is the meaning of that practice of yours, that silent meditation which some of your learned men speak of?" they respond, "When I pray to the honor of one of the Gods, I sit down – the foot of either leg on the thigh of the other – look towards Heaven, and calmly elevate my thoughts with my hands folded in silence; then I say, I am Brahm the Supreme Being. We are not conscious to ourselves of being Brahm, by reason of Maya (the delusion occasioned by the outward world). It is forbidden to pray to him, and to offer sacrifices to him in his own nature; for this would be to adore ourselves. In every case therefore, it is only emanations of Brahm that we address." Translating these ideas then into our own process of thought, we should call Brahm the pure unity of thought in itself – God in the incomplexity of his existence. No temples are consecrated to him, and he receives no worship. Similarly, in the Catholic religion, the churches are not dedicated to God, but to the saints. Other Englishmen, who have devoted themselves to investigating the conception

of Brahm, have thought Brahm to be an unmeaning epithet, applied to all gods: so that Vishnu says, "I am Brahm"; and the Sun, the Air, the Seas are called Brahm. Brahm would on this supposition be substance in its simplicity, which by its very nature expands itself into the limitless variety of phenomenal diversities. For this abstraction, this pure unity, is that which lies at the foundation of All – the root of all definite existence. In the intellection of this unity, all objectivity falls away; for the purely Abstract is intellection itself in its greatest vacuity. To attain this Death of Life during life itself – to constitute this abstraction – requires the disappearance of all moral activity and volition, and of all intellection too, as in the Religion of Fo; and this is the object of the penances already spoken of.

The complement to the abstraction Brahm must then be looked for in the concrete complex of things; for the principle of the Hindoo religion is the Manifestation of Diversity (in "Avatars"). These then, fall outside that abstract Unity of Thought, and as that which deviates from it, constitute the variety found in the world of sense, the variety of intellectual conceptions in an unreflected sensuous form. In this way the concrete complex of material things is isolated from Spirit, and presented in wild distraction, except as re-absorbed in the pure ideality of Brahm. The other deities are therefore things of sense: Mountains, Streams, Beasts, the Sun, the Moon, the Ganges. The next stage is the concentration of this wild variety into substantial distinctions, and the comprehension of them as a series of divine persons. Vishnu, Siva, Mahâdeva are thus distinguished from Brahma. In the embodiment Vishnu are presented those incarnations in which God has appeared as man, and which are always historical personages, who effected important changes and new epochs. The power of procreation is likewise a substantial embodiment; and in the excavations, grottos and pagodas of the Hindoos, the Lingam is always found as symbolizing the male, and the Lotus the female *vis procreandi.* With this Duality – abstract unity on the

one side and the abstract isolation of the world of sense on the other side – exactly corresponds the double form of *Worship,* in the relation of the human subjectivity to God. The one side of this duality of worship consists in the abstraction of pure self-elevation – the abrogation of real self-consiousness; a negativity which is consequently manifested, on the one hand, in the attainment of torpid unconsciousness – on the other hand in suicide and the extinction of all that *is* worth calling life, by self-inflicted tortures. The other side of worship consists in a wild tumult of excess; when all sense of individuality has vanished from consciousness by immersion in the merely natural; with which individuality thus makes itself identical – destroying its consciousness of distinction from Nature. In all the pagodas, therefore, prostitutes and dancing girls are kept, whom the Brahmins instruct most carefully in dancing, in beautiful postures and attractive gestures, and who have to comply with the wishes of all comers at a fixed price. Theological doctrine – relation of religion to morality – is here altogether out of the question. On the one hand Love – Heaven – in short everything spiritual – is conceived by the fancy of the Hindoo; but on the other hand his conceptions have an actual sensuous embodiment, and he immerses himself by a voluptuous intoxication in the merely natural. Objects of religious worship are thus either disgusting forms produced by art, or those presented by Nature. Every bird, every monkey, is a present god, an absolutely universal existence. The Hindoo is incapable of holding fast an object in his mind by means of rational predicates assigned to it, for this requires reflection. While a universal essence is wrongly transmuted into sensuous objectivity, the latter is also driven from its definite character into universality – a process whereby it loses its footing and is expanded to indefiniteness.

If we proceed to ask how far their religion exhibits the *Morality* of the Hindoos, the answer must be that the former is as distinct from the latter, as

Brahm from the concrete existence of which he is the essence. To *us,* religion is the knowledge of that Being who is emphatically *our* Being, and therefore the substance of our knowledge and volition; the proper office of which latter is to be the mirror of this fundamental substance. But that requires this (Highest) Being to be *in se* a personality, pursuing divine aims, such as can become the purport of human action. Such an idea of a relation of the Being of God as constituting the universal basis or substance of human action – such a morality cannot be found among the Hindoos; for they have not the Spiritual as the import of their consciousness. On the one hand their virtue consists in the abstraction from all activity – the condition they call "Brahm." On the other hand every action with them is a prescribed external usage; not free activity, the result of inward personality. Thus the moral condition of the Hindoos (as already observed) shows itself most abandoned. In this all Englishmen agree. Our judgment of the morality of the Hindoos is apt to be warped by representations of their mildness, tenderness, beautiful and sentimental fancy. But we must reflect that in nations utterly corrupt, there are sides of character which may be called tender and noble. We have Chinese poems in which the tenderest relations of love are depicted; in which delineations of deep emotion, humility, modesty, propriety are to be found; and which may be compared with the best that European literature contains. The same characteristics meet us in many Hindoo poems ; but rectitude, morality, freedom of soul, consciousness of individual right are quite another thing. The annihilating of spiritual and physical existence has nothing concrete in it; and absorption in the abstractly Universal has no connection with the real. Deceit and cunning are the fundamental characteristics of the Hindoo. Cheating, stealing, robbing, murdering are with him habitual. Humbly crouching and abject before a victor and lord, he is recklessly barbarous to the vanquished and subject.

Characteristic of the Hindoo's humanity is the fact that he kills no brute animal, founds and supports rich hospitals for brutes, especially for old cows and monkeys – but that through the whole land, no single institution can be found for human beings who are diseased or infirm from age. The Hindoos will not tread upon ants, but they are perfectly indifferent when poor wanderers pine away with hunger. The Brahmins are especially immoral. According to English reports, they do nothing but eat and sleep. In what is not forbidden them by the rules of their order they follow natural impulses entirely. When they take any part in public life they show themselves avaricious, deceitful, voluptuous. With those whom they have reason to fear, they are humble enough; for which they avenge themselves on their dependents. "I do not know an honest man among them," says an English authority. Children have no respect for their parents: sons maltreat their mothers.

It would lead us too far to give a detailed notice of Hindoo *Art* and *Science.* But we may make the general remark, that a more accurate acquaintance with its real value has not a little diminished the widely bruited fame of Indian Wisdom. According to the Hindoo principle of pure self-renouncing Ideality, and that (phenomenal) variety which goes to the opposite extreme of sensuousness, it is evident that nothing but abstract thought and imagination can be developed. Thus, *e.g.,* their grammar has advanced to a high degree of consistent regularity ; but when substantial matter in sciences and works of art is in question, it is useless to look for it here. When the English had become masters of the country, the work of restoring to light the records of Indian culture was commenced, and William Jones first disinterred the poems of the Golden Age. The English exhibited plays at Calcutta: this led to a representation of dramas on the part of the Brahmins, *e.g.,* the Sacontala of Calidasa, etc. In the enthusiasm of discovery the Hindoo culture was very highly rated; and as, when new

beauties are discovered, the old ones are commonly looked down upon with contempt, Hindoo poetry and philosophy were extolled as far superior to the Greek. For our purpose the most important documents are the ancient and canonical books of the Hindoos, especially the *Vedas.* They comprise many divisions, of which the fourth is of more recent origin. They consist partly of religious prayers, partly of precepts to be observed. Some manuscripts of these Vedas have come to Europe, though in a complete form they are exceedingly rare. The writing is on palm leaves, scratched in with a needle. The Vedas are very difficult to understand, since they date from the most remote antiquity, and the language is a much older Sanscrit. *Colebrooke* has indeed translated a part, but this itself is perhaps taken from a commentary, of which there are very many. Two great epic poems, Ramayana and Mahabharata, have also reached Europe. Three quarto volumes of the former have been printed, the second volume is extremely rare. Besides these works, the Puranas must be particularly noticed. The *Puranas* contain the history of a god or of a temple. They are entirely fanciful. Another Hindoo classical book is the Code of *Manu.* This Hindoo lawgiver has been compared with the Cretan Minos – a name which also occurs among the Egyptians; and certainly this extensive occurrence of the same name is noteworthy and cannot be ascribed to chance. Manu's code of morals, (published at Calcutta with an English translation by Sir W. Jones) forms the basis of Hindoo legislation. It begins with a Theogony, which is not only entirely different from the mythological conceptions of other peoples (as might be expected), but also deviates essentially from the Hindoo traditions themselves. For in these also there are only some leading features that pervade the whole. In other respects everything is abandoned to chance, caprice and fancy; the result of which is that the most multiform traditions, shapes and names, appear in never ending procession. The time when Manu's code was composed, is also entirely unknown and undetermined.

The traditions reach beyond twenty-three centuries before the birth of Christ: a dynasty of the Children of the Sun is mentioned, on which followed one of the Children of the Moon. Thus much, however, is certain, that the code in question is of high antiquity ; and an acquaintance with it is of the greatest importance to the English, as their knowledge of Hindoo Law is derived from it. After pointing out the Hindoo principle in the distinctions of caste, in religion and literature, we must also mention the mode and form of their *political* existence – the polity of the Hindoo *State.* – A State is a realization of Spirit, such that in it the self-conscious being of Spirit – the freedom of the Will – is realized as Law. Such an institution then, necessarily presupposes the consciousness of free will. In the Chinese State the moral will of the Emperor is the law: but so that subjective, inward freedom is thereby repressed, and the Law of Freedom governs individuals only as from without. In India the primary aspect of subjectivity – viz., that of the imagination – presents a union of the Natural and Spiritual, in which Nature on the one hand, does not present itself as a world embodying Reason, nor the Spiritual on the other hand, as consciousness in contrast with Nature. Here the antithesis in the (above-stated) principle is wanting. Freedom both as *abstract* will and *as subjective* freedom is absent. The proper basis of the State, the principle of freedom is altogether absent: there cannot therefore be any State in the true sense of the term. This is the first point to be observed: if China may be regarded as nothing else but a State, Hindoo political existence presents us with a people, but *no State.* Secondly, while we found a moral despotism in *China,* whatever may be called a relic of political life in *India,* is a despotism *without a principle,* without any rule of morality and religion: for morality and religion (as far as the latter has a reference to human action) have as their indispensable condition and basis the freedom of the Will. In India, therefore, the most arbitrary, wicked, degrading despotism has its full swing. China, Persia, Turkey – in fact Asia

generally, is the scene of despotism, and, in a bad sense, of tyranny; but it is regarded as contrary to the due order of things, and is disapproved by religion and the moral consciousness of individuals. In those countries, tyranny rouses men to resentment; they detest it and groan under it as a burden. To them it is an accident and an irregularity, not a necessity: it *ought* not to exist. But in India it is normal: for here there is no sense of personal independence with which a state of despotism could be compared, and which would raise revolt in the soul; nothing approaching even a resentful protest against it, is left, except the corporeal smart, and the pain of being deprived of absolute necessaries and of pleasure.

In the case of such a people, therefore, that which we call in its double sense, *History,* is not to be looked for; and here the distinction between China and India is most clearly and strongly manifest. The Chinese possess a most minute history of their country, and it has been already remarked what arrangements are made in China for having everything accurately noted down in their annals. The contrary is the case in India. Though the recent discoveries of the treasures of Indian Literature have shown us what a reputation the Hindoos have acquired in Geometry, Astronomy, and Algebra – that they have made great advances in Philosophy, and that among them, Grammar has been so far cultivated that no language can be regarded as more fully developed than the Sanscrit – we find the department of *History* altogether neglected, or rather non-existent. For History requires Understanding – the power of looking at an object in an independent objective light, and comprehending it in its rational connection with other objects. Those peoples therefore are alone capable of History, and of prose generally, who have arrived at that period of development (and can make that their starting point) at which individuals comprehend their own existence as independent, *i.e.,* possess self-consciousness.

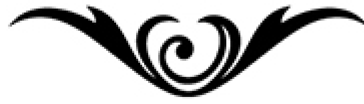
The Chinese are to be rated at what they have made of themselves, looking at them in the entirety of their State. While they have thus attained an existence independent of Nature, they can also regard objects as distinct from themselves – as they are actually presented – in a definite form and in their real connection. The Hindoos on the contrary are by birth given over to an unyielding destiny, while at the same time their Spirit is exalted to Ideality; so that their minds exhibit the contradictory processes of a dissolution of fixed rational and definite conceptions in their Ideality, and on the other side, a degradation of this ideality to a multiformity of sensuous objects. This makes them incapable of writing History. All that happens is dissipated in their minds into confused dreams. What we call historical truth and veracity – intelligent, thoughtful comprehension of events, and fidelity in representing them – nothing of this sort can be looked for among the Hindoos. We may explain this deficiency partly from that excitement and debility of the nerves, which prevent them from retaining an object in their minds, and firmly comprehending it, for in their mode of apprehension, a sensitive and imaginative temperament changes it into a feverish dream; – partly from the fact, that veracity is the direct contrary to their nature. They even lie knowingly and designedly where misapprehension is out of the question. As the Hindoo Spirit is a state of dreaming and mental transiency – a self-oblivious dissolution – objects also dissolve for it into unreal images and indefinitude. This feature is absolutely characteristic; and this alone would furnish us with a clear idea of the Spirit of the Hindoos, from which all that has been said might be deduced. But History is always of great importance for a people; since by means of that it becomes conscious of the path of development taken by its own Spirit, which expresses itself in Laws, Manners, Customs, and Deeds. Laws, comprising morals and judicial institutions, are by nature the permanent element in a people's existence. But History presents a people with their

own image in a condition which thereby becomes objective to them. Without History their existence in time is blindly self-involved – the recurring play of arbitrary volition in manifold forms. History fixes and imparts consistency to this fortuitous current – gives it the form of Universality, and by so doing posits a directive and restrictive rule for it. It is an essential instrument in developing and determining the Constitution – that is, a rational political condition; for it is the empirical method of producing the Universal, inasmuch as it sets up a permanent object for the conceptive powers. – It is because the Hindoos have no History in the form of annals (*historia*) that they have no History in the form of transactions (*res gestae*); that is, no growth expanding into a veritable political condition. Periods of time are mentioned in the Hindoo Writings, and large numbers which have often an astronomical meaning, but which have still oftener a quite arbitrary origin. Thus it is related of certain Kings that they had reigned 70,000 years, or more. Brahma, the first figure in the Cosmogony, and self-produced, is said to have lived 20,000 years, etc. Innumerable names of Kings are cited – among them the incarnations of Vishnu. It would be ridiculous to regard passages of this kind as anything historical. In their poems Kings are often talked of: these may have been historical personages, but they completely vanish in fable; *e.g.,* they retire from the world, and then appear again, after they have passed ten thousand years in solitude. The numbers in question, therefore, have not the value and rational meaning which we attach to them.

Consequently the oldest and most reliable sources of Indian History are the notices of Greek Authors, after Alexander the Great had opened the way to India. From them we learn that their institutions were the same at that early period as they are now: Santaracottus (Chandragupta) is marked out as a distinguished ruler in the northern part of India, to which the Bactrian kingdom extended. The Mahometan historians supply another source of

information; for the Mahometans began their invasions as early as the tenth century. A Turkish slave was the ancestor of the Ghiznian race. His son Mahmoud made an inroad into Hindostan and conquered almost the whole country. He fixed his royal residence west of Cabul, and at his court lived the poet Ferdusi. The Ghiznian dynasty was soon entirely exterminated by the sweeping attacks of the Afghans and Moguls. In later times nearly the whole of India has been subjected to the Europeans. What therefore is known of Indian history, has for the most part been communicated through foreign channels: the native literature gives only indistinct data. Europeans assure us of the impossibility of wading through the morasses of Indian statements. More definite information may be obtained from inscriptions and documents, especially from the deeds of gifts of land to pagodas and divinities ; but this kind of evidence supplies names only. Another source of information is the astronomical literature, which is of high antiquity. Colebrooke thoroughly studied these writings ; though it is very difficult to procure manuscripts, since the Brahmins keep them very close; they are moreover disfigured by the grossest interpolations. It is found that the statements with regard to constellations are often contradictory, and that the Brahmins interpolate these ancient works with events belonging to their own time. The Hindoos do indeed possess lists and enumerations of their Kings, but these also are of the most capricious character; for we often find twenty Kings more in one list than in another; and should these lists even be correct, they could not constitute a history. The Brahmins have no conscience in respect to truth. Captain Wilford had procured manuscripts from all quarters with great trouble and expense; he assembled a considerable number of Brahmins, and commissioned them to make extracts from these works, and to institute inquiries respecting certain remarkable events – about Adam and Eve, the Deluge, etc. The Brahmins, to please their employer, produced statements of the kind required; but there

was nothing of the sort in the manuscripts. Wilford wrote many treatises on the subject, till at last he detected the deception, and saw that he had labored in vain. The Hindoos have, it is true, a fixed Era: they reckon from *Vicramâditya,* at whose splendid court lived Calidasa, the author of the Sacontala. The most illustrious poets flourished about the same time. “There were nine pearls at the court of Vicramaditya,” say the Brahmins: but we cannot discover the date of this brilliant epoch. From various statements, the year 1491 B.C. has been contended for; others adopt the year 50 B.C., and this is the commonly received opinion. Bentley’s researches at length placed Vicramaditya in the twelfth century B.C. But still more recently it has been discovered that there were five, or even eight or nine kings of that name in India; so that on this point also we are thrown back into utter uncertainty.



When the Europeans became acquainted with India, they found a multitude of petty Kingdoms, at whose head were Mahometan and Indian princes. There was an order of things very nearly approaching feudal organization; and the Kingdoms in question were divided into districts, having as governors Mahometans, or people of the Warrior Caste of Hindoos. The business of these governors consisted in collecting taxes and carrying on wars; and they thus formed a kind of aristocracy, the Prince’s Council of State. But only as far as their princes are feared and excite fear, have they any power; and no obedience is rendered to them but by force. As long as the prince does not want money, he has troops; and neighboring princes, if they are inferior to him in force, are often obliged to pay taxes, but which are yielded only on compulsion. The whole state of things, therefore, is not that of repose, but of continual struggle; while moreover nothing is developed or furthered. It is the struggle of an energetic will on the part of this or that prince against a feebler one; the history of reigning dynasties, but not of peoples; a series of perpetually varying intrigues and

revolts – not indeed of subjects against their rulers, but of a prince's son, for instance, against his father; of brothers, uncles and nephews in contest with each other; and of functionaries against their master. It might be believed that, though the Europeans found such a state of things, this was the result of the dissolution of earlier superior organizations. It might, for instance, be supposed that the period of the Mogul supremacy was of one of prosperity and splendor, and of a political condition in which India was not distracted religiously and politically by foreign conquerors. But the historical traces and lineaments that accidentally present themselves in poetical descriptions and legends, bearing upon the period in question, always point to the same divided condition – the result of war and of the instability of political relations; while contrary representations may be easily recognized as a dream, a mere fancy. This state of things is the natural result of that conception of Hindoo life which has been exhibited, and the conditions which it necessitates. The wars of the sects of the Brahmins and Buddhists, of the devotees of Vishnu and of Siva, also contributed their quota to this confusion. – There is indeed, a common character pervading the whole of India; but its several states present at the same time the greatest variety; so that in one Indian State we meet with the greatest effeminacy – in another, on the contrary, we find prodigious vigor and savage barbarity. If then, in conclusion, we once more take a general view of the comparative condition of India and China, we shall see that China was characterized by a thoroughly unimaginative Understanding; a prosaic life amid firm and definite reality: while in the Indian world there is, so to speak, no object that can be regarded as real, and firmly defined – none that was not at its first apprehension perverted by the imagination to the very opposite of what it presents to an intelligent consciousness. In China it is the Moral which constitutes the substance of the laws, and which is embodied in external strictly determinate relations; while over all hovers the patriarchal

providence of the Emperor, who like a Father, cares impartially for the interest of his subjects. Among the Hindoos, on the contrary – instead of this Unity – Diversity is the fundamental characteristic. Religion, War, Handicraft, Trade, yes, even the most trivial occupations are parcelled out with rigid separation – constituting as they do the import of the one will which they involve, and whose various requirements they exhaust. With this is bound up a monstrous, irrational imagination, which attaches the moral value and character of men to an infinity of outward actions as empty in point of intellect as of feeling; sets aside all respect for the welfare of man, and even makes a duty of the cruellest and severest contravention of it. Those distinctions being rigidly maintained, nothing remains for the one universal will of the State but pure caprice, against whose omnipotence only the fixed caste-distinctions avail for protection. The Chinese in their prosaic rationality, reverence as the Highest, only the abstract supreme lord; and they exhibit a contemptibly superstitious respect for the fixed and definite

Among the Hindoos there is no such superstition so far as it presents an antithesis to Understanding; rather their whole life and ideas are one unbroken superstition, because among them all is revery and consequent enslavement. Annihilation – the abandonment of all reason, morality and subjectivity – can only come to a positive feeling and consciousness of itself, by extravagating in a boundlessly wild imagination; in which, like a desolate spirit, it finds no rest, no settled composure, though it can content itself in no other way; *as* a man who is quite reduced in body and spirit finds his existence altogether stupid and intolerable, and is driven to the creation of a dream-world and a delirious bliss in Opium.

SECTION II. (CONTINUED). INDIA – BUDDHISM.

IT IS TIME to quit the Dream-State characterizing the Hindoo Spirit revelling in the most extravagant maze through all natural and spiritual forms; comprising at the same time the coarsest sensuality and anticipations of the profoundest thought, and on that very account – as far as free and rational reality is concerned – sunk in the most self-abandoned, helpless slavery; – a slavery, in which the abstract forms into which concrete human life is divided, have become stereotyped, and human rights and culture have been made absolutely dependent upon these distinctions. In contrast with this inebriate Dream-life, which in the sphere of reality is bound fast in chains, we have the *unconstrained* Dream-life; which on the one hand is ruder than the former – as not having advanced so far *as* to make this distinction of modes of life – but for the same reason, has not sunk into the slavery which this entails. It keeps itself more free, more independently firm in itself: its world of ideas is consequently compressed into simpler conceptions. The Spirit of the Phase just indicated, is involved in the same fundamental principle as that assigned to Hindoo conceptions: but it is more concentrated in itself; its religion is simpler, and the accompanying political condition more calm and settled. This phase comprehends peoples and countries of the most varied complexion. We regard it as embracing Ceylon, Farther India with the Burman Empire, Siam, Anam – north of that Thibet, and further on the Chinese Upland with its various populations of Mongols and Tartars. We shall not examine the special individualities of these peoples, but merely characterize their Religion, which constitutes the most interesting side of their existence. The Religion of these peoples is *Buddhism,* which is the most widely extended religion on our globe. In

China Buddha is reverenced as *Fo*; in Ceylon as *Gautama;* in Thibet and among the Mongols this religion has assumed the phase of Lamaism. In China – where the religion of Fo early received a great extension, and introduced a monastic life – it occupies the position of an integrant element of the Chinese principle. As the Substantial form of Spirit which characterizes China, develops itself only to a unity of *secular* national life, which degrades individuals to a position of constant dependence, religion also remains in a state of dependence. The element of freedom is wanting to it; for its object is the principle of Nature in general – Heaven – Universal Matter. But the (compensating) truth of this alienated form of Spirit (Nature occupying the place of the Absolute Spirit) is *ideal* Unity; the elevation above the limitation of Nature and of existence at large; – the return of consciousness into the soul. This element, which is contained in Buddhism, has made its way in China, to that extent to which the Chinese have become aware of the unspirituality of their condition, and the limitation that hampers their consciousness. – In this religion – which may be generally described as the religion of self-involvement (undeveloped Unity) – the elevation of that unspiritual condition to subjectivity, takes place in two ways; one of which is of a negative, the other of an affirmative kind.

The *negative* form of this elevation is the concentration of Spirit to the Infinite, and must first present itself under theological conditions. It is contained in the fundamental dogma, that Nothingness is the principle of all things – that all proceeded from and returns to Nothingness. The various forms found in the World are only modifications of procession [thence]. If an analysis of these various forms were attempted, they would lose their quality; for in themselves all things are one and the same inseparable essence, and this essence is Nothingness. The connection of this with the Metempsychosis can be thus explained: All (that we see) is but a change of Form. The inherent infinity of Spirit – infinite concrete self-dependence – is

entirely separate from this Universe of phenomena. Abstract Nothingness is properly that which lies beyond Finite Existence – what we may call the Supreme Being. This real principle of the Universe is, it is said, in eternal repose, and in itself unchangeable. Its essence consists in the absence of activity and volition. For Nothingness is abstract Unity with itself. To obtain happiness, therefore, man must seek to assimilate himself to this principle by continual victories over himself; and for the sake of this, do nothing, wish nothing, desire nothing. In this condition of happiness, therefore, Vice or Virtue is out of the question; for the true blessedness is Union with Nothingness. The more man frees himself from all speciality of existence, the nearer does he approach perfection; and in the annihilation of all activity – in pure passivity – he attains complete resemblance to Fo. The abstract Unity in question is not a mere Futurity – a Spiritual sphere existing beyond our own; it has to do with the present; it is truth for man [as he is], and ought to be realized in him. In Ceylon and the Burman Empire – where this Buddhistic Faith has its roots – there prevails an idea, that man can attain by meditation, to exemption from sickness, old age and death.

But while this is the *negative* form of the elevation of Spirit from immersion in the Objective to a subjective realization of itself, this Religion also advances to the consciousness of an *affirmative* form. Spirit is the Absolute. Yet in comprehending Spirit it is a point of essential importance in what determinate form Spirit is conceived. When we speak of Spirit as universal, we know that for us it exists only in an inward conception ; but to attain this point of view – to appreciate Spirit in the pure subjectivity of Thought and conception – is the result of a longer process of culture. At that point in history at which we have now arrived, the form of Spirit is not advanced beyond Immediateness (the idea of it is not yet refined by reflection and abstraction). God is conceived in an immediate, unreflected form; not in the form of Thought – objectively. But this immediate Form is

that of humanity. The Sun, the Stars do not come up to the idea of Spirit; but Man seems to realize it; and he, as *Buddha, Gautama, Fo* – in the form of a departed teacher, and in the living form of the Grand Lama – receives divine worship. The Abstract Understanding generally objects to this idea of *a* Godman; alleging as a defect that the form here assigned to Spirit is an immediate [unreflected, unrefined] one – that in fact it is none other than Man in the concrete. Here the character of a whole people is bound up with the theological view just indicated. The *Mongols* – a race extending through the whole of central Asia as far as Siberia, where they are subject to the Russians – worship the Lama; and with this form of worship a simple political condition, a patriarchal life is closely united; for they are properly a Nomad people, and only occasionally are commotions excited among them, when they seem to be beside themselves, and eruptions and inundations of vast hordes are occasioned. Of the Lamas there are three: the best known is the Dalai-Lama, who has his seat at Lassa in the kingdom of Thibet. A second is the Teshoo-Lama, who under the title of Bantshen Rinbot-shee resides at Teshoo-Lomboo; there is also a third in Southern Siberia. The first two Lamas preside over two distinct sects, of which the priests of one wear yellow caps, those of the other, red. The wearers of the yellow caps – at whose head is the Dalai-Lama, and among whose adherents is the Emperor of China – have introduced celibacy among the priests, while the red sect allow their marriage. The English have become considerably acquainted with the Teshoo-Lama and have given us descriptions of him.

The general form which the spirit of the Lamaistic development of Buddhism assumes, is that of a living human being; while in the original Buddhism it is a deceased person. The two hold in common the relationship to a man. The idea of a man being worshipped as God – especially a living man – has in it something paradoxical and revolting; but the following

considerations must be examined before we pronounce judgment respecting it. The conception of Spirit involves its being regarded as inherently, intrinsically, universal. This condition must be particularly observed, and it must be discovered how in the systems adopted by various peoples this universality is kept in view. It is not the individuality of the subject that is revered, but that which is universal in him; and which among the Thibetans, Hindoos, and Asiatics generally, is regarded as the essence pervading all things. This substantial Unity of Spirit is realized in the Lama, who is nothing but the form in which Spirit manifests itself; and who does not hold this Spiritual Essence as his peculiar property, but is regarded as partaking in it only in order to exhibit it to others, that they may attain a conception of Spirituality and be led to piety and blessedness. The Lama's personality as such – his particular individuality – is therefore subordinate to that substantial essence which it embodies. The second point which constitutes an essential feature in the conception of the Lama is the disconnection from Nature. The Imperial dignity of China involved [as we saw] a supremacy over the powers of Nature; while here spiritual power is directly separated from the *vis Natures.* The idea never crosses the minds of the Lama-worshippers to desire of the Lama to show himself Lord of Nature – to exercise magical and miraculous power; for from the being they call God, they look only for spiritual activity and the bestowal of spiritual benefits. Buddha has moreover the express names "Saviour of Souls" – "Sea of Virtue" – " the Great Teacher." Those who have become acquainted with the Teshoo-Lama depict him as a most excellent person, of the calmest temper and most devoted to meditation. Thus also do the Lama-worshippers regard him. They see in him a man constantly occupied with religion, and who when he directs his attention to what is human, does so only to impart consolation and encouragement by his blessing, and by the exercise of mercy and the bestowal of forgiveness. These Lamas lead a thoroughly

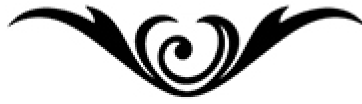
isolated life and have a feminine rather than masculine training. Early torn from the arms of his parents the Lama is generally a well- formed and beautiful child. He is brought up amid perfect quiet and solitude, in a kind of prison: he is well catered for, and remains without exercise or childish play, so that it is not surprising that a feminine susceptible tendency prevails in his character. The Grand Lamas have under them inferior Lamas as presidents of the great fraternities. In Thibet every father who has four sons is obliged to dedicate one to a conventual life. The Mongols, who are especially devoted to Lamaism – this modification of Buddhism – have great respect for all that possesses life. They live chiefly on vegetables, and revolt from killing any animal, even a louse. This worship of the Lamas has supplanted Shamanism, that is, the religion of Sorcery. The Shamans – priests of this religion – intoxicate themselves with strong drinks and dancing, and while in this state perform their incantations, fall exhausted on the ground, and utter words which pass for oracular. Since Buddhism and Lamaism have taken the place of the Shaman Religion, the life of the Mongols has been simple, prescriptive and patriarchal. Where they take any part in History, we find them occasioning impulses that have only been the groundwork of historical development. Thera is therefore little to be said about the political administration of the Lamas. A Vizier has charge of the secular dominion and reports everything to the Lama: the government is simple and lenient; and the veneration which the Mongols pay to the Lama, expresses itself chiefly in their asking counsel of him in political affairs.

SECTION III: PERSIA.

ASIA SEPARATES ITSELF into two parts – Hither and Farther Asia; which are essentially different from each other. While the Chinese and Hindoos – the two great nations of Farther Asia, already considered – belong to the strictly Asiatic, namely the Mongolian Race, and consequently possess a quite peculiar character, discrepant from ours; the nations of Hither Asia belong to the Caucasian, *i.e.* the European Stock. They are related to the West, while the Farther- Asiatic peoples are perfectly isolated. The European who goes from Persia to India, observes, therefore, a prodigious contrast. Whereas in the former country he finds himself still somewhat at home, and meets with European dispositions, human virtues and human passions – as soon as he crosses the Indus (*i.e.,* in the *latter* region), he encounters the most repellent characteristics, pervading every single feature of society.

With the Persian Empire we first enter on continuous History. The Persians are the first Historical People; Persia was the first Empire that passed away. While China and India remain stationary, and perpetuate a natural vegetative existence even to the present time, this land has been subject to those developments and revolutions, which alone manifest a historical condition. The Chinese and the Indian Empire assert a place in the historical series only on their own account and for us (not for neighbors and successors). But here in Persia first arises that light which shines itself, and illuminates what is around; for *Zoroaster's* "Light" belongs to the World of Consciousness – to Spirit as a relation to something distinct from itself. We see in the Persian World a pure exalted Unity, as the essence which leaves the special existences that inhere in it, free; – as the Light, which only

manifests what bodies are in themselves; – a Unity which governs individuals only to excite them to become powerful for themselves – to develop and assert their individuality. Light makes no distinctions: the Sun shines on the righteous and the unrighteous, on high and low, and confers on all the same benefit and prosperity. Light is vitalizing only in so far as it is brought to bear on something distinct from itself, operating upon and developing that. It holds a position of antithesis to Darkness, and this antithetical relation opens out to us the principle of activity and life. The principle of development begins with the history of Persia. This therefore constitutes strictly the beginning of World-History; for the grand interest of Spirit in History, is to attain an unlimited immanence of subjectivity – by an absolute antithesis to attain complete harmony.



Thus the transition which we have to make, is only in the sphere of the Idea, not in the external historical connection. The principle of this transition is that the Universal Essence, which we recognized in Brahm, now becomes perceptible to consciousness – becomes an object and acquires a positive import for man. Brahm is not worshipped by the Hindoos: he is nothing more than a condition of the Individual, a religious feeling, a non-objective existence – a relation, which for concrete vitality is that of annihilation. But in becoming objective, this Universal Essence acquires a positive nature: man becomes free, and thus occupies a position face to face as it were with the Highest Being, the latter being made objective for him. This form of Universality we see exhibited in Persia, involving a separation of man from the Universal essence; while at the same time the individual recognizes himself as identical with [a partaker in], that essence. In the Chinese and Indian principle, this distinction was not made. We found only a unit of the Spiritual and the Natural. But Spirit still involved in Nature has to solve the problem of freeing itself from the latter. Rights and Duties in India are intimately connected with special classes,

and are therefore only peculiarities attaching to man by the arrangement of Nature. In China this unity presents itself under the conditions of *paternal* government. Man is not free there; he possesses no moral element, since he is identical with the external command [obedience is purely *natural,* as in the filial relation – not the result of reflection and principle]. In the Persian principle, Unity first elevates itself to the distinction from the merely natural; we have the negation of that unreflecting relation which allowed no exercise of mind to intervene between the mandate and its adoption by the will. In the Persian principle this unity is manifested as Light, which in this case is not simply light as such, the most universal physical element, but at the same time also *spiritual* purity – the Good. Speciality – the involvement with *limited* Nature – is consequently abolished. Light, in a physical and spiritual sense, imports, therefore, elevation – freedom from the merely natural. Man sustains a relation to Light – to the Abstract Good – as to something objective, which is acknowledged, reverenced, and evoked to activity by his Will. If we look back once more – and we cannot do so too frequently – on the phases which we have traversed in arriving at this point, we perceive in China the totality of a moral Whole, but excluding subjectivity; – this totality divided into members, but without independence in its various portions. We found only an external arrangement of this political Unity. In India, on the contrary, distinctions made themselves prominent; but the *principle* of separation was unspiritual. We found incipient subjectivity, but hampered with the condition, that the separation in question is insurmountable; and that Spirit remains involved in the limitations of Nature, and is therefore a self-contradiction. Above this purity of Castes is that purity of Light which we observe in Persia; that Abstract Good, to which all are equally able to approach, and in which all equally may be hallowed. The Unity recognized therefore, now first becomes a

principle, not an external bond of soulless order. The fact that everyone has a share in that principle, secures to him personal dignity.

First as to *Geographical position,* we see China and India, exhibiting as it were the dull half- conscious brooding of Spirit, in fruitful plains – distinct from which is the lofty girdle of mountains with the wandering hordes that occupy them. The inhabitants of the heights, in their conquest, did not change the spirit of the plains, but imbibed it themselves. But in Persia the two principles – retaining their diversity – became united, and the mountain peoples with their principle became the predominant element. The two chief divisions which we have to mention are: – the Persian Upland itself, and the Valley Plains, which are reduced under the dominion of the inhabitants of the Uplands. That elevated territory is bounded on the east by the Soliman mountains, which are continued in a northerly direction by the Hindoo Koosh and Belur Tag. The latter separate the anterior region – Bactriana and Sogdiana, occupying the plains of the Oxus – from the Chinese Upland, which extends as far as Cashgar. That plain of the Oxus itself lies to the north of the Persian Upland, which declines on the south towards the Persian Gulf. This is the geographical position of Iran. On its western declivity lies Persia (Farsistan); higher to the north, Kourdistan – beyond this Armenia. Thence extend in a southwesterly direction the river districts of the Tigris and the Euphrates. – The elements of the Persian Empire are the Zend race – the old Parsees; next the Assyrian, Median and Babylonian Empire in the region mentioned; but the Persian Empire also includes Asia Minor, Egypt, and Syria, with its line of coast; and thus combines the Upland, the Valley Plains and the Coast region.

CHAPTER I. THE ZEND PEOPLE

THE ZEND PEOPLE derived their name from the language in which the *Zend Books* are written, *i.e.,* the canonical books on which the religion of the ancient Parsees is founded. Of this religion of the Parsees or Fire-worshippers, there are still traces extant. There is a colony of them in Bombay; and on the Caspian Sea there are some scattered families that have retained this form of worship. Their national existence was put an end to by the Mahometans. The great *Zerdusht* – called Zoroaster by the Greeks – wrote his religious books in the Zend language. Until nearly the last third of the eighteenth century, this language and all the writings composed in it, were entirely unknown to Europeans; when at length the celebrated Frenchman, *Anquetil- Duperron,* disclosed to us these rich treasures. Filled with an enthusiasm for the Oriental World, which his poverty did not allow him to gratify, he enlisted in a French corps that was about to sail for India. He thus reached Bombay, where he met with the Parsees, and entered on the study of their religious ideas. With indescribable difficulty he succeeded in obtaining their religious books; making his way into their literature, and thus opening an entirely new and wide field of research, but which, owing to his imperfect acquaintance with the language, still awaits thorough investigation.

Where the Zend people, mentioned in the religious books of Zoroaster, lived, is difficult to determine. In Media and Persia the religion of Zoroaster prevailed, and Xenophon relates that Cyrus adopted it: but none of these countries was the proper habitat of the Zend people. Zoroaster himself calls it the pure Aryan: we find a similar name in Herodotus, for he says that the Medes were formerly called Arii – a name with which the designation Iran

is connected. South of the Oxus runs a mountain chain in the ancient Bactriana – with which the elevated plains commence, that were inhabited by the Medes, the Parthians, and the Hyrcanians. In the district watered by the Oxus at the commencement of its course, Bactra – probably the modern Balk – is said to have been situated; from which Cabul and Cashmere are distant only about eight days' journey. Here in Bactriana appears to have been the seat of the Zend people. In the time of Cyrus we find the pure and original faith, and the ancient political and social relations such as they are described in the Zend books, no longer perfect. Thus much appears certain, that the Zend language, which is connected with the Sanscrit, was the language of the Persians, Medes, and Bactrians. The laws and institutions of the people bear an evident stamp of great simplicity. Four classes are mentioned : Priests, Warriors, Agriculturists, and Craftsmen. Trade only is not noticed; from which it would appear that the people still remained in an isolated condition. Governors of Districts, Towns, and Roads, are mentioned; so that all points to the social phase of society – the political not being yet developed; and nothing indicates a connection with other states. It is essential to note, that we find here no Castes, but only Classes, and that there are no restrictions on marriage between these different Classes; though the Zend writings announce civil laws and penalties, together with religious enactments.

The chief point – that which especially concerns us here – is the *doctrine* of Zoroaster. In contrast with the wretched hebetude of Spirit which we find among the Hindoos, a pure ether – an exhalation of Spirit – meets us in the Persian conception. In it, Spirit emerges from that substantial Unity of Nature, that substantial destitution of import, in which a separation has not yet taken place – in which Spirit has not yet an independent existence in contraposition to its object. This people, namely, attained to the consciousness, that absolute Truth must have the form of Universality – of

Unity. This Universal, Eternal, Infinite Essence is not recognized at first, as conditioned in any way; it is Unlimited Identity. This is properly (and we have already frequently repeated it) also the character of Brahm. But this Universal Being became objective, and their Spirit became the consciousness of this its Essence; while on the contrary among the Hindoos this objectivity is only the *natural* one of the Brahmins, and is recognized as pure Universality only in the destruction of consciousness. Among the Persians this negative assertion has become a positive one; and man has a relation to Universal Being of such a kind that he remains positive in sustaining it. This One, Universal Being, is indeed not yet recognized as the free Unity of Thought; not yet "worshipped in Spirit and in Truth"; but is still clothed with a form – that of Light. But Light is not a Lama, a Brahmin, a Mountain, a brute – this or that particular existence – but sensuous Universality itself; simple manifestation. The Persian Religion is therefore no idol-worship ; it does not adore individual natural objects, but the Universal itself. Light admits, moreover, the signification of the Spiritual; it is the form of the Good and True – the substantiality of knowledge and volition as well as of all natural things. Light puts man in a position to be able to exercise choice; and he can only choose when he has emerged from that which had absorbed him. But Light directly involves an Opposite, namely, Darkness; just as Evil is the antithesis of Good. As man could not appreciate Good, if Evil were not; and as he can be really good only when he has become acquainted with the contrary, so the Light does not exist without Darkness. Among the Persians, *Ormuzd* and *Ahriman* present the antithesis in question. Ormuzd is the Lord of the kingdom of Light – of Good; Ahriman that of Darkness – of Evil. But there is a still higher being from whom both proceeded – a Universal Being not affected by this antithesis, called *Zeruane-Akerene* – the Unlimited All. The All, *i.e.,* is something abstract; it does not exist for itself, and Ormuzd and Ahriman

have arisen from it. This Dualism is commonly brought as a reproach against Oriental thought; and, as far as the contradiction is regarded as absolute, that is certainly an irreligious understanding which remains satisfied with it. But the very nature of Spirit demands antithesis; the principle of Dualism belongs therefore to the idea of Spirit, which, in its concrete form, essentially involves distinction. Among the Persians, Purity and Impurity have both become subjects of consciousness; and Spirit, in order to comprehend itself, must of necessity place the Special and Negative existence in contrast with the Universal and Positive. Only by overcoming this antithesis is Spirit twice-born – regenerated. The deficiency in the Persian principle is only that the Unity of the antithesis is not completely recognized; for in that indefinite conception of the Uncreated All, whence Ormuzd and Ahriman proceeded, the Unity is only the absolutely *Primal* existence, and does not reduce the contradictory elements to harmony in itself. Ormuzd creates of his own free will; but also according to the decree of Zeruane-Akerene (the representation wavers) ; and the harmonizing of the contradiction is only to be found in the contest which Ormuzd carries on with Ahriman, and in which he will at last conquer. Ormuzd is the Lord of Light, and he creates all that is beautiful and noble in the World, which is a Kingdom of the Sun. He is the excellent, the good, the positive in all natural and spiritual existence. Light is the *body of Ormusd;* thence the worship of Fire, because Ormuzd is present in all Light; but he is not the Sun or Moon itself. In these the Persians venerate only the Light, which is Ormuzd. Zoroaster asks Ormuzd who he is? He answers: “My Name is the ground and centre of all existence – Highest Wisdom and Science – Destroyer of the Ills of the World, and maintainer of the Universe – Fulness of Blessedness – Pure Will,” etc. That which comes from Ormuzd is living, independent, and lasting. Language testifies to his power; prayers are his productions. Darkness is on the contrary the body of

Ahriman; but a perpetual fire banishes him from the temples. The chief end of every man's existence is to keep himself pure, and to spread this purity around him. The precepts that have this in view are very diffuse; the moral requirements are however characterized by mildness. It is said: if a man loads you with revilings, and insults, but subsequently humbles himself, call him your friend. We read in the Vendidad, that sacrifices consist chiefly of the flesh of clean animals, flowers and fruits, milk and perfumes. It is said there, "As man was created pure and worthy of Heaven, he becomes pure again through the law of the servants of Ormuzd, which is purity itself; if he purifies himself by sanctity of thought, word, and deed. What is 'Pure Thought'? That which ascends to the beginning of things. What is ' Pure Word '? The Word of Ormuzd (the Word is thus personified and imports the living Spirit of the whole revelation of Ormuzd). What is 'Pure Deed'? The humble adoration of the Heavenly Hosts, created at the beginning of things." It is implied in this that man should be virtuous: his own will, his subjective freedom is presupposed. Ormuzd is not limited to particular forms of existence. Sun, Moon, and five other stars, which seem to indicate the planets – those illuminating and illuminated bodies – are the primary symbols of Ormuzd; the *Ainshaspand,* his first sons. Among these, Mitra is also named: but we are at a loss to fix upon the star which this name denotes, as we are also in reference to the others. The *Mitra* is placed in the Zend Books among the other stars; yet in the penal code moral transgressions are called "Mitrasins" – *e.g.,* breach of promise, entailing 300 lashes; to which in the case of theft, 300 years of punishment in Hell are to be added. Mitra appears here as the presiding genius of man's inward higher life. Later on, great importance is assigned to Mitra as the mediator between Ormuzd and men. Even Herodotus mentions the adoration of Mitra. In Rome, at a later date, it became very prevalent as a secret worship; and we find traces of it even far into the middle ages. Besides those noticed

there are other protecting genii, which rank under the Amshaspand, their superiors; and are the governors and preservers of the world. The council of the seven great men whom the Persian Monarch had about him was likewise instituted in imitation of the court of Ormuzd. The *Fervers* – a kind of Spirit-World – are distinguished from the creatures of the mundane sphere. The Fervers are not Spirits according to our idea, for they exist in every natural object, whether fire, water, or earth. Their existence is coeval with the origin of things; they are in all places, in highroads, towns, etc., and are prepared to give help to supplicants. Their abode is in Gorodman, the dwelling of the "Blessed," above the solid vault of heaven. As Son of Ormuzd we find the name Dshemshid: apparently the same as he whom the Greeks call Achsemenes, whose descendants are called Pishdadians – a race to which Cyrus was reported to belong. Even at a later period the Persians seem to have had the designation Achaemenians among the Romans. (Horace, Odes III. i. 44.) Dshemshid, it is said, pierced the earth with a golden dagger; which means nothing more than that he introduced agriculture. He is said then to have traversed the various countries, originated springs and rivers, and thereby fertilized certain tracts of land, and made the valleys teem with living beings, etc. In the Zendavesta, the name Gustasp is also frequently mentioned, which many recent investigators have been inclined to connect with Darius Hystaspes; an idea however that cannot be entertained for a moment, for this Gustasp doubtless belongs to the ancient Zend Race – to a period therefore antecedent to Cyrus. Mention is made in the Zend books of the Turanians also, *i.e.,* the Nomade tribes of the north; though nothing historical can be thence deduced.

The *ritual observances* of the religion of Ormuzd import that men should conduct themselves in harmony with the Kingdom of Light. The great general commandment is therefore, as already said, spiritual and corporeal

purity, consisting in many prayers to Ormuzd. It was made specially obligatory upon the Persians, to maintain living existences – to plant trees – to dig wells – to fertilize deserts; in order that Life, the Positive, the Pure might be furthered, and the dominion of Ormuzd be universally extended. External purity is contravened by touching a dead animal, and there are many directions for being purified from such pollution. Herodotus relates of Cyrus, that when he went against Babylon, and the river Gyndes engulfed one of the horses of the Chariot of the Sun, he was occupied for a year in punishing it, by diverting its stream into small canals, to deprive it of its power. Thus Xerxes, when the sea broke in pieces his bridges, had chains laid upon it as the wicked and pernicious being – Ahriman.

CHAPTER II. THE ASSYRIANS, BABYLONIANS, MEDES, AND PERSIANS.

As the Zend Race was the higher spiritual element of the Persian Empire, so in Assyria and Babylonia we have the element of external wealth, luxury and commerce. Traditions respecting them ascend to the remotest periods of History; but in themselves they are obscure, and partly contradictory; and this contradiction is the less easy to be cleared up, as they have no canonical books or indigenous works. The Greek historian Ctesias is said to have had direct access to the archives of the Persian Kings; yet we have only a few fragments remaining. Herodotus gives us much information; the accounts in the Bible are also valuable and remarkable in the highest degree, for the Hebrews were immediately connected with the Babylonians. In regard to the Persians, special mention must be made of the Epic, "Shah-nameh," by Ferdusi – a heroic poem in 60,000 strophes, from which Gorres has given a copious extract. Ferdusi lived at the beginning of the eleventh century A.D. at the court of Mahmoud the Great, at Ghasna, east of Cabul and Candahar. The celebrated Epic just mentioned has the old heroic traditions of Iran (that is of West Persia proper) for its subject; but it has not the value of *a* historical authority, since its contents are poetical and its author a Mahometan. The contest of Iran and Turan is described in this heroic poem. Iran is Persia Proper – the Mountain Land on the south of the Oxus; Turan denotes the plains of the Oxus and those lying between it and the ancient Jaxartes. A hero, Rustan, plays the principal part in the poem; but its narrations are either altogether fabulous, or quite distorted. Mention is made of Alexander, and he is called Ishkander or Skander of Roum. Roum means the Turkish Empire (even now

one of its provinces is called Roumelia), but it denotes also the *Roman*; and in the poem Alexander's Empire has equally the appellation Roum. Confusions of this kind are quite of a piece with the Mahometan views. It is related in the poem, that the King of Iran made war on Philip, and that this latter was beaten. The King then demanded Philip's daughter as a wife; but after he had lived a long time with her, he sent her away because her breath was disagreeable. On returning to her father, she gave birth to a son – Skander, who hastened to Iran to take possession of the throne after the death of his father. Add to the above that in the whole of the poem no personage or narrative occurs that can be connected with Cyrus, and we have sufficient data for estimating its historical value. It has a value for us, however, so far as Ferdusi therein exhibits the spirit of his time, and the character and interest of Modern Persian views.

As regards *Assyria,* we must observe, that it is a rather indeterminate designation. Assyria Proper is a part of Mesopotamia, to the north of Babylon. As chief towns of this Empire are mentioned, Atur or Assur on the Tigris, and of later origin Nineveh, said to have been founded and built by Ninus, the Founder of the Assyrian Empire. In those times one City constituted the whole Empire – Nineveh for example: so also Ecbatana in Media, which is said to have had seven walls, between whose inclosures agriculture was carried on; and within whose innermost wall was the palace of the ruler. Thus too, Nineveh, according to Diodorus, was 480 Stadia (about 12 German miles – 55 English) in circumference. On the walls, which were 100 feet high, were fifteen hundred towers, within which a vast mass of people resided. Babylon included an equally immense population. These cities arose in consequence of a twofold necessity – on the one hand that of giving up the nomad life and pursuing agriculture, handicrafts and trade in a fixed abode; and on the other hand of gaining protection against the roving mountain peoples, and the predatory Arabs. Older traditions

indicate that this entire valley district was traversed by Nomads, and that this mode of life gave way before that of the cities. Thus Abraham wandered forth with his family from Mesopotamia westwards, into mountainous Palestine. Even at this day the country round Bagdad is thus infested by roving Nomads. Nineveh is said to have been built 2050 years before Christ; consequently the founding of the Assyrian Kingdom is of no later date. Ninus reduced under his sway also Babylonia, Media and Bactriana; the conquest of which latter country is particularly extolled as having displayed the greatest energy; for Ctesias reckons the number of troops that accompanied Ninus, at 1,700,000 infantry and a proportionate number of cavalry. Bactra was besieged for a very considerable time, and its conquest is ascribed to Semiramis; who with a valiant host is said to have ascended the steep acclivity of a mountain. The personality of Semiramis wavers between mythological and historical representations. To her is ascribed the building of the Tower of Babel, respecting which we have in the Bible one of the oldest of traditions. – *Babylon* lay to the south, on the Euphrates, in a plain of great fertility and well adapted for agriculture. On the Euphrates and the Tigris there was considerable navigation. Vessels came partly from Armenia, partly from the South, to Babylon, and conveyed thither an immense amount of material wealth. The land round Babylon was intersected by innumerable canals; more for purposes of agriculture – to irrigate the soil and to obviate inundations – than for navigation. The magnificent buildings of Semiramis in Babylon itself are celebrated; though how much of the city is to be ascribed to the more ancient period, is undetermined and uncertain. It is said that Babylon formed a square, bisected by the Euphrates. On one side of the stream was the temple of Bel, on the other the great palaces of the monarchs. The city is reputed to have had a hundred brazen *(i.e.* copper) gates, its walls being a hundred feet high, and thick in proportion, defended by two hundred and

fifty towers. The thoroughfares in the city which led towards the river were closed every night by brazen doors. *Ker Porter,* an Englishman, about twelve years ago (his whole tour occupied from 1817 to 1820) traversed the countries where ancient Babylon lay: on an elevation he thought he could discover remains still existing of the old tower of Babel; and supposed that he had found traces of the numerous roads that wound around the tower, and in whose loftiest story the image of Bel was set up. There are besides many hills with remains of ancient structures. The bricks correspond with the description in the Biblical record of the building of the tower. A vast plain is covered by an innumerable multitude of such bricks, although for many thousand years the practice of removing them has been continued ; and the entire town of Hila, which lies in the vicinity of the ancient Babylon, has been built with them. Herodotus relates some remarkable facts in the customs of the Babylonians, which appear to show that they were people living peaceably and neighborly with each other. When anyone in Babylon fell ill, he was brought to some open place, that every passerby might have the opportunity of giving him his advice. Marriageable daughters were disposed of by auction, and the high price offered for a belle was allotted as a dowry for her plainer neighbor. Such an arrangement was not deemed inconsistent with the obligation under which every woman lay of prostituting herself once in her life in the temple of Mylitta. It is difficult to discover what connection this had with their religious ideas. This excepted, according to Herodotus's account, immorality invaded Babylon only at a later period, when the people became poorer. The fact that the fairer portion of the sex furnished dowries for their less attractive sisters, seems to confirm his testimony so far as it shows a provident care for all; while that bringing of the sick into the public places indicates a certain neighborly feeling. We must here mention the *Medes* also. They were, like the Persians, a mountain-people, whose habitations were south and

southwest of the Caspian Sea and stretched as far as Armenia. Among these Medes the Magi are also noticed as one of the six tribes that formed the Median people, whose chief characteristics were fierceness, barbarism, and warlike courage. The capital Ecbatana was built by Dejoces, not earlier. He is said to have united under his kingly rule the tribes of the Medes; after they had made themselves free a second time from Assyrian supremacy, and to have induced them to build and to fortify for him a palace befitting his dignity. As to the religion of the Medes, the Greeks call all the oriental Priests, Magi, which is therefore a perfectly indefinite name. But all the data point to the fact that among the Magi we may look for a comparatively close connection with the Zend religion; but that, although the Magi preserved and extended it, it experienced great modifications in transmission to the various peoples who adopted it. Xenophon says, that Cyrus was the first that sacrificed to God according to the fashion of the Magi. The Medes therefore acted as a medium for propagating the Zend Religion.

The Assyrian-Babylonian Empire, which held so many peoples in subjection, is said to have existed for one thousand or fifteen hundred years. The last ruler was Sardanapaltis – a great voluptuary, according to the descriptions we have of him. Arbaces, the Satrap of Media, excited the other satraps against him; and in combination with them, led the troops which assembled every year at Nineveh to pay the tribute, against Sardanapalus. The latter, although he had gained many victories, was at last compelled to yield before overwhelming force, and to shut himself up in Nineveh; and, when he could not longer offer resistance, to burn himself there with all his treasure. According to some chronologists, this took place 888 years B.C. ; according to others, at the end of the seventh century. After this catastrophe the empire was entirely broken up: it was divided into an Assyrian, a Median, and a Babylonian Empire, to which also belonged the

Chaldeans – a mountain people from the north which had united with the Babylonians. These several Empires had in their turn various fortunes; though here we meet with a confusion in the accounts which has never been cleared up. Within this period of their existence begins their connection with the Jews and Egyptians. The Jewish people succumbed to superior force; the Jews were carried captive to Babylon, and from them we have accurate information respecting the condition of this Empire. According to Daniel's statements there existed in Babylon a carefully appointed organization for government business. He speaks of Magians – from whom the expounders of sacred writings, the soothsayers, astrologers, Wise Men and Chaldeans who interpreted dreams, are distinguished. The Prophets generally say much of the great commerce of Babylon; but they also draw a terrible picture of the prevailing depravity of manners.

The real culmination of the Persian Empire is to be looked for in connection with the *Persian* people properly so called, which, embracing in its rule all Anterior Asia, came into contact with the Greeks. The Persians are found in extremely close and early connection with the Medes; and the transmission of the sovereignty to the Persians makes no essential difference ; for Cyrus was himself a relation of the Median King, and the names of Persia and Media melt into one. At the head of the Persians and Medes, Cyrus made war upon Lydia and its king Croesus. Herodotus relates that there had been wars before that time between Lydia and Media, but which had been settled by the intervention of the King of Babylon. We recognize here a system of States, consisting of Lydia, Media, and Babylon. The latter had become predominant and had extended its dominion to the Mediterranean Sea. Lydia stretched eastward as far as the Halys; and the border of the western coast of Asia Minor, the fair Greek colonies, were subject to it; a high degree of culture was thus already present in the Lydian Empire. Art and poetry were blooming there as cultivated by the Greeks.

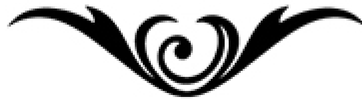
These colonies also were subjected to Persia. Wise men, such as Bias, and still earlier, Thales, advised them to unite themselves in a firm league, or to quit their cities and possessions, and to seek out for themselves other habitations; (Bias meant Sardinia). But such a union could not be realized among cities which were animated by the bitterest jealousy of each other, and who lived in continual quarrel: while in the intoxication of affluence they were not capable of forming the heroic resolve to leave their homes for the sake of freedom. Only when they were on the very point of being subjugated by the Persians, did some cities give up certain for prospective possessions, in their aspiration after the highest good – Liberty. Herodotus says of the war against the Lydians, that it made the Persians who were previously poor and barbarous, acquainted for the first time with the luxuries of life and civilization. After the Lydian conquest Cyrus subjugated Babylon. With it he came into possession of Syria and Palestine; freed the Jews from captivity, and allowed them to rebuild their temple. Lastly, he led an expedition against the Massagetae; engaged with them in the steppes between the Oxus and the Jaxartes, but sustained a defeat, and died the death of a warrior and conqueror. The death of heroes who have formed an epoch in the History of the World, is stamped with the character of their mission. Cyrus thus died in his mission, which was the union of Anterior Asia into one sovereignty without an ulterior object.

CHAPTER III. THE PERSIAN EMPIRE AND ITS CONSTITUENT PARTS.

THE PERSIAN EMPIRE is an Empire in the *modern* sense – like that which existed in Germany, and the great imperial realm under the sway of Napoleon; for we find it consisting of a number of states, which are indeed dependent, but which have retained their own individuality, their manners, and laws. The general enactments, binding upon all, did not infringe upon their political and social idiosyncrasies, but even protected and maintained them; so that each of the nations that constitute the whole, had its own form of Constitution. As Light illuminates everything – imparting to each object a peculiar vitality – so the Persian Empire extends over a multitude of nations, and leaves to each one its particular character. Some have even kings of their own; each one its distinct language, arms, way of life, and customs. All this diversity coexists harmoniously under the impartial dominion of Light. The Persian Empire comprehends all the three geographical elements, which we classified as distinct. First, the Uplands of Persia and Media; next, the Valley-plains of the Euphrates and Tigris, whose inhabitants are found united in a developed form of civilization, with Egypt – the Valley-plain of the Nile – where agriculture, industrial arts and sciences flourished; and lastly a third element, viz. the nations who encounter the perils of the sea – the Syrians, the Phoenicians, the inhabitants of the Greek colonies and Greek Maritime States in Asia Minor. Persia thus united in itself the three natural principles, while China and India remained foreign to the sea. We find here neither that consolidated totality which China presents, nor that Hindoo life, in which an anarchy of caprice is prevalent everywhere. In Persia, the government, though joining

all in a central unity, is but a combination of peoples – leaving each of them free. Thereby a stop is put to that barbarism and ferocity with which the nations had been wont to carry on their destructive feuds, and which the Book of Kings and the Book of Samuel sufficiently attest. The lamentations of the Prophets and their imprecations upon the state of things before the conquest, show the misery, wickedness and disorder that prevailed among them, and the happiness which Cyrus diffused over the region of Anterior Asia. It was not given to the Asiatics to unite self-dependence, freedom and substantial vigor of mind, with culture, *i.e.,* an interest for diverse pursuits and an acquaintance with the conveniences of life. Military valor among them is consistent only with barbarity of manners. It is not the calm courage of order; and when their mind opens to a sympathy with various interests, it immediately passes into effeminacy; allows its energies to sink, and makes men the slaves of an enervated sensuality.

PERSIA



THE PERSIANS – a free mountain and nomad people – though ruling over richer, more civilized and fertile lands – retained on the whole the fundamental characteristics of their ancient mode of life. They stood with one foot on their ancestral territory, with the other on their foreign conquests. In his ancestral land the King was a friend among friends, and as if surrounded by equals. Outside of it, he was the lord to whom all were subject, and bound to acknowledge their dependence by the payment of tribute. Faithful to the Zend religion, the Persians give themselves to the pursuit of piety and the pure worship of Ormuzd. The tombs of the Kings were in Persia Proper; and there the King sometimes visited his countrymen, with whom he lived in relations of the greatest simplicity. He brought with him presents for them, while all other nations were obliged to make presents to him. At the court of the monarch there was a division of Persian cavalry which constituted the *elite* of the whole army, ate at a common table, and were subject to a most perfect discipline in every respect. They made themselves illustrious by their bravery, and even the Greeks awarded a tribute of respect to their valor in the Median wars. When the entire Persian host, to which this division belonged, was to engage in an expedition, a summons was first issued to all the Asiatic populations. When the warriors were assembled, the expedition was undertaken with that character of restlessness, that nomadic disposition which formed the idiosyncrasy of the Persians. Thus they invaded Egypt, Scythia, Thrace, and at last Greece; where their vast power was destined to be shattered. A march of this kind looked almost like an emigration: their families accompanied them.

Each people exhibited its national features and warlike accoutrements, and poured forth *en masse.* Each had its own order of march and mode of warfare. Herodotus sketches for us a brilliant picture of this variety of aspect as it presented itself in the vast march of nations under Xerxes (two millions of human beings are said to have accompanied him). Yet, as these peoples were so unequally disciplined – so diverse in strength and bravery – it is easy to understand how the small but well-trained armies of the Greeks, animated by the same spirit, and under matchless leadership, could withstand those innumerable but disorderly hosts of the Persians. The provinces had to provide for the support of the Persian cavalry, which were quartered in the centre of the kingdom. Babylon had to contribute the third part of the supplies in question, and consequently appears to have been by far the richest district. As regards other branches of revenue, each people was obliged to supply the choicest of the peculiar produce which the district afforded. Thus Arabia gave frankincense, Syria purple, etc.

The education of the princes – but especially that of the heir to the throne – was conducted with extreme care. Till their seventh year the sons of the King remained among the women, and did not come into the royal presence. From their seventh year forward they were instructed in hunting, riding, shooting with the bow, and also in speaking the truth. There is one statement to the effect that the prince received instruction in the Magian lore of Zoroaster. Four of the noblest Persians conducted the prince's education. The magnates of the land, at large, constituted a kind of Diet. Among them Magi were also found. They are depicted as free men, animated by a noble fidelity and patriotism. Of such character seem the seven nobles – the counterpart of the Amshaspand who stand around Ormuzd – when after the unmasking of the false Smerdis, who on the death of King Cambyses gave himself out as his brother, they assembled to deliberate on the most desirable form of government. Quite free from

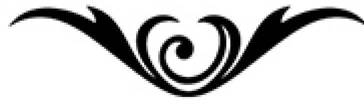
passion, and without exhibiting any ambition, they agree that monarchy is the only form of government adapted to the Persian Empire. The Sun, and the horse which first salutes them with a neigh, decide the succession in favor of Darius. The magnitude of the Persian dominion occasioned the government of the provinces by viceroys – Satraps; and these often acted very arbitrarily to the provinces subjected to their rule, and displayed hatred and envy towards each other; a source of much evil. These satraps were only superior presidents of the provinces, and generally left the subject kings of the countries in possession of regal privileges. All the land and all the water belonged to the Great King of the Persians. "Land and Water" were the demands of Darius Hystaspes and Xerxes from the Greeks. But the King was only the abstract sovereign: the enjoyment of the country remained to the nations themselves; whose obligations were comprised in the maintenance of the court and the satraps, and the contribution of the choicest part of their property. Uniform taxes first make their appearance under the government of Darius Hystaspes. On the occasion of a royal progress the districts of the empire visited had to give presents to the King; and from the amount of these gifts we may infer the wealth of the unexhausted provinces. Thus the dominion of the Persians was by no means oppressive, either in secular or religious respects. The Persians, according to Herodotus, had no idols – in fact ridiculed anthropomorphic representations of the gods; but they tolerated every religion, although there may be found expressions of wrath against idolatry. Greek temples were destroyed, and the images of the gods broken in pieces.

SYRIA AND THE SEMITIC WESTERN ASIA

ONE ELEMENT – the coast territory – which also belonged to the Persian Empire, is especially represented by Syria. It was peculiarly important to the Persian Empire; for when Continental Persia set out on one of its great expeditions, it was accompanied by Phoenician as well as by Greek navies. The Phoenician coast is but a very narrow border – often only two leagues broad – which has the high mountains of Lebanon on the East. On the seacoast lay a series of noble and rich cities, as Tyre, Sidon, Byblus, Berytus, carrying on great trade and commerce; which last, however, was too isolated and confined to that particular country, to allow it to affect the whole Persian state. Their commerce lay chiefly in the direction of the Mediterranean sea, and it reached thence far into the West. Through its intercourse with so many nations, Syria soon attained a high degree of culture. There the most beautiful fabrications in metals and precious stones were prepared, and there the most important discoveries, *e.g.,* of Glass and of Purple, were made. Written language there received its first development, for in their intercourse with various nations the need of it was soon felt. (So, to quote another example, Lord Macartney observes that in Canton itself, the Chinese had felt and expressed the need of a more pliable written language.) The *Phoenicians* discovered and first navigated the Atlantic Ocean. They had settlements in Cyprus and Crete. In the remote island of Thasos, they worked gold mines. In the south and southwest of Spain they opened silver mines. In Africa they founded the colonies of Utica and Carthage. From Gades they sailed far down the African coast, and according to some, even circumnavigated Africa. From Britain they brought tin, and from the Baltic, Prussian amber. This opens to us an entirely new

principle. Inactivity ceases, as also mere rude valor; in their place appears the activity of Industry, and that considerate courage which, while it dares the perils of the deep, rationally bethinks itself of the means of safety. Here everything depends on Man's activity, his courage, his intelligence; while the objects aimed at are also pursued in the interest of Man. Human will and activity here occupy the foreground, not Nature and its bounty. Babylonia had its determinate share of territory, and human subsistence was there dependent on the course of the sun and the process of Nature generally. But the sailor relies upon himself amid the fluctuations of the waves, and eye and heart must be always open. In like manner the principle of Industry involves the very opposite of what is received from Nature; for natural objects are worked up for use and ornament. In Industry Man is an object to himself, and treats Nature as something subject to him, on which he impresses the seal of his activity. Intelligence is the valor needed here, and ingenuity is better than mere natural courage. At this point we see the nations freed from the fear of Nature and its slavish bondage.

If we compare their *religious* ideas with the above, we shall see in *Babylon,* in the *Syrian* tribes, and in *Phrygia,* first a rude, vulgar, sensual idolatry – a description of which in its principal features is given in the Prophets. Nothing indeed more specific than idolatry is mentioned; and this is an indefinite term. The Chinese, the Hindoos, the Greeks, practise idolatry; the Catholics, too, adore the images of saints; but in the sphere of thought with which we are at present occupied, it is the powers of Nature and of production generally that constitute the object of veneration; and the worship is luxury and pleasure. The Prophets give the most terrible pictures of this – though their repulsive character must be partly laid to the account of the hatred of Jews against neighboring peoples. Such representations are particularly ample in the Book of Wisdom. Not only was there a worship of natural objects, but also of the Universal Power of Nature – Astarte, Cybele,



Diana of Ephesus. The worship paid was a sensuous intoxication, excess, and revelry: sensuality and cruelty are its two characteristic traits. "When they keep their holy days they act as if mad," ["they are mad when they be merry" – English Version] says the Book of Wisdom (xiv. 28). With a merely sensuous life – this being a form of consciousness which does not attain to general conceptions – cruelty is connected; because Nature itself is the Highest, so that Man has no value, or only the most trifling. Moreover, the genius of such a polytheism involves the destruction of its consciousness on the part of Spirit in striving to identify itself with Nature, and the annihilation of the Spiritual generally. Thus we see children sacrificed – priests of Cybele subjecting themselves to mutilation – men making themselves eunuchs – women prostituting themselves in the temple. As a feature of the court of Babylon it deserves to be remarked, that when Daniel was brought up there, it was not required of him to take part in the religious observances; and moreover that food ceremonially pure was allowed him; that he was in requisition especially for interpreting the dreams of the King, because he had "the spirit of the holy gods." The King proposes to elevate himself above sensuous life by dreams, as indications from a superior power. It is thus generally evident, that the bond of religion was lax, and that here no unity is to be found. For we observe also adorations offered to images of *kings;* the power of Nature and the *King* as a spiritual Power, are the Highest; so that in this form of idolatry there is manifested a perfect contrast to the Persian purity.

We find on the other hand something quite different among the *Phoenicians,* that bold seafaring people. Herodotus tells us, that at Tyre Hercules was worshipped. If the divinity in question is not absolutely identical with the Greek demigod, there must be understood by that name one whose attributes nearly agree with his. This worship is particularly indicative of the character of the people; for it is Hercules of whom the

Greeks say, that he raised himself to Olympus by dint of human courage and daring. The idea of the Sun perhaps originated that of Hercules as engaged in his twelve labors; but this basis does not give us the chief feature of the myth, which is, that Hercules is that scion of the gods who, by his virtue and exertion, made himself a god by human spirit and valor; and who, instead of passing his life in idleness, spends it in hardship and toil. A *second* religious element is the worship of *Adonis,* which takes place in the towns of the coast (it was celebrated in Egypt also by the Ptolemies) ; and respecting which we find a notable passage in the Book of Wisdom (xiv. 13, etc.), where it is said: "The idols were not from the beginning – but were invented through the vain ambition of men, because the latter are short-lived. For a father afflicted with untimely mourning, when he had made an image of his child (Adonis) early taken away, honored him as a god, who was a dead man, and delivered to those that were under him ceremonies and sacrifices" (E. V. nearly). The feast of Adonis was very similar to the worship of Osiris – the commemoration of his death – a funeral festival, at which the women broke out into the most extravagant lamentations over the departed god. In India lamentation is suppressed in the heroism of insensibility; uncomplaining, the women there plunge into the river, and the men, ingenious in inventing penances, impose upon themselves the direst tortures ; for they give themselves up to the loss of vitality, in order to destroy consciousness in empty abstract contemplation. Here, on the contrary, human pain becomes an element of worship; in pain man realizes his subjectivity: it is expected of him – he may here indulge self-consciousness and the feeling of actual existence. Life here regains its value. A universality of pain is established: for death becomes immanent in the Divine, and the deity dies. Among the Persians we saw Light and Darkness struggling with each other, but here both principles are united in one – the Absolute. The Negative is here, too, the merely Natural; but as the

death of a *god,* it is not a limitation attaching to an individual object, but is pure Negativity itself. And this point is important, because the generic conception that has to be formed of Deity is Spirit; which involves its being concrete, and having in it the element of negativity. The qualities of wisdom and power are also concrete qualities, but only as predicates; so that God remains abstract substantial unity, in which differences themselves vanish, and do not become *organic* elements (Momente) of this unity. But here the Negative itself is a *phase* of Deity – the Natural – Death; – the worship appropriate to which is grief. It is in the celebration of the death of Adonis, and of his resurrection, that the concrete is made conscious. Adonis is a youth, who is torn from his parents by a too early death. In China, in the worship of ancestors, these latter enjoy divine honor. But parents in their decease only pay the debt of Nature. When a *youth* is snatched away by death, the occurrence is regarded as contrary to the proper order of things: and while affliction at the death of parents is no *just* affliction, in the case of youth death is a paradox. And this is the deeper element in the conception – that in the Divinity, Negativity – Antithesis – is manifested; and that the worship rendered to him involves both elements – the pain felt for the divinity snatched away, and the joy occasioned by his being found again.

JUDAEA

THE NEXT PEOPLE belonging to the Persian empire, in that wide circle of nationalities which it comprises, is the *Jewish.* We find here, too, a canonical book – the *Old Testament;* in which the views of this people – whose principle is the exact opposite of the one just described – are exhibited. While among the Phoenician people the Spiritual was still limited by Nature, in the case of the Jews we find it entirely purified; – the pure product of Thought. Self-conception appears in the field of consciousness, and the Spiritual develops itself in sharp contrast to Nature and to union with it. It is true that we observed at an earlier stage the pure conception "Brahm"; but only as the universal being of Nature; and with this limitation, that Brahm is not himself an object of consciousness. Among the Persians we saw this abstract being become an object for consciousness, but it was that of sensuous intuition – as Light. But the idea of Light has at this stage advanced to that of "Jehovah" – the *purely One.* This forms the point of separation between the East and the West; Spirit descends into the depths of its own being, and recognizes the abstract fundamental principle as the Spiritual. Nature – which in the East is the primary and fundamental existence – is now depressed to the condition of a mere creature; and Spirit now occupies the first place. God is known as the creator of all men, as he is of all nature, and as absolute causality generally. But this great principle, as further conditioned, is *exclusive* Unity. This religion must necessarily possess the element of exclusiveness, which consists essentially in this – that only the One People which adopts it, recognizes the One God, and is acknowledged by him. The God of the Jewish People is the God only of Abraham and of his seed: National individuality and a special local worship

are involved in such a conception of deity. Before him all other gods are false: moreover the distinction between "true" and "false" is quite abstract; for as regards the false gods, not a ray of the Divine is supposed to shine into them. But every form of spiritual force, and *à fortiori* every religion is of such a nature, that whatever be its peculiar character, an affirmative element is necessarily contained in it. However erroneous a religion may be, it possesses truth, although in a mutilated phase. In every religion there is a divine presence, *a* divine relation; and a philosophy of History has to seek out the spiritual element even in the most imperfect forms. But it does not follow that because it is a religion, it is therefore *good.* We must not fall into the lax conception, that the content is of no importance, but only the form. This latitudinarian tolerance the Jewish religion does not admit, being absolutely exclusive.

The Spiritual speaks itself here absolutely free of the Sensuous, and Nature is reduced to something merely external and undivine. This is the true and proper estimate of Nature at this stage; for only at a more advanced phase can the Idea attain a reconciliation [recognize itself] in this its alien form. Its first utterances will be in opposition to Nature; for Spirit, which had been hitherto dishonored, now first attains its due dignity, while Nature resumes its proper position. Nature is conceived as having the ground of its existence in another – as something posited, created; and this idea, that God is the lord and creator of Nature, leads men to regard God as the Exalted One, while the whole of Nature is only his robe of glory, and is expended in his service. In contrast with this kind of exaltation, that which the Hindoo religion presents is only that of indefinitude. In virtue of the prevailing spirituality the Sensuous and Immoral are no longer privileged, but disparaged as ungodliness. Only the One – Spirit – the Non-sensuous is the Truth; Thought exists free for itself, and true morality and righteousness can now make their appearance; for God is honored by righteousness, and

rightdoing is “walking in the way of the Lord.” With this is conjoined happiness, life and temporal prosperity as its reward; for it is said: “that thou mayest live long in the land.” – Here too also we have the possibility of a *historical* view; for the understanding has become prosaic; putting the limited and circumscribed in its proper place, and comprehending it as the form proper to finite existence: Men are regarded as individuals, not as incarnations of God; Sun as Sun, Mountains as Mountains – not as possessing Spirit and Will.

We observe among this people a severe religious ceremonial, expressing a relation to pure Thought. The individual as concrete does not become free, because the Absolute itself is not comprehended as *concrete* Spirit; since Spirit still appears posited as non-spiritual – destitute of its proper characteristics. It is true that subjective feeling is manifest – the pure heart, repentance, devotion; but the particular concrete individuality has not become objective to itself in the Absolute. It therefore remains closely bound to the observance of ceremonies and of the Law, the basis of which latter is pure freedom in its abstract form. The Jews possess that which makes them what they are, through the *One:* consequently the individual has no freedom for itself. Spinoza regards the code of Moses as having been given by God to the Jews for a punishment – a rod of correction. The individual never comes to the consciousness of independence; on that account we do not find among the Jews any belief in the immortality of the soul; for individuality does not exist in and for itself. But though in Judaism the *Individual* is not respected, the *Family* has inherent value; for the worship of Jehovah is attached to the Family, and it is consequently viewed as a substantial existence. But the State is an institution not consonant with the Judaistic principle, and it is alien to the legislation of Moses. In the idea of the Jews, Jehovah is the God of Abraham, of Isaac, and Jacob; who commanded them to depart out of Egypt, and gave them the land of Canaan.

The accounts of the Patriarchs attract our interest. We seen in this history the transition from the patriarchal nomad condition to agriculture. On the whole the Jewish history exhibits grand features of character; but it is disfigured by an exclusive bearing (sanctioned in its religion), towards the genius of other nations (the destruction of the inhabitants of Canaan being even commanded) – by want of culture generally, and by the superstition arising from the idea of the high value of their peculiar nationality. Miracles, too, form a disturbing feature in this history – *as history;* for as far as concrete consciousness is not free, concrete perception is also not free; Nature is undeified, but not yet understood.

The Family became a great nation; through the conquest of Canaan, it took a whole country into possession ; and erected a Temple for the entire people, in Jerusalem. But properly speaking no *political* union existed. In case of national danger heroes arose, who placed themselves at the head of the armies; though the nation during this period was for the most part in subjection. Later on, kings were chosen, and it was they who first rendered the Jews independent. David even made conquests. Originally the legislation is adapted to a family only; yet in the books of Moses the wish for *a* king is anticipated. The priests are to choose him: he is not to be a foreigner – not to have horsemen in large numbers – and he is to have few wives. After a short period of glory the kingdom suffered internal disruption and was divided. As there was only one tribe of Levites and one Temple – *i.e.,* in Jerusalem – idolatry was immediately introduced. The One God could not be honored in different Temples, and there could not be two kingdoms attached to one religion. However spiritual may be the conception of God as objective, the subjective side – the honor rendered to him – is still very limited and unspiritual in character. The two kingdoms, equally infelicitous in foreign and domestic warfare, were at last subjected

to the Assyrians and Babylonians ; through Cyrus the Israelites obtained permission to return home and live according to their own laws.

EGYPT

THE PERSIAN EMPIRE is one that has passed away, and we have nothing but melancholy relics of its glory. Its fairest and richest towns – such as Babylon, Susa, Persepolis – are razed to the ground; and only a few ruins mark their ancient site. Even in the more modern great cities of Persia – Ispahan and Shiraz – half of them has become a ruin; and they have not – as is the case with ancient Rome – developed a new life, but have lost their place almost entirely in the remembrance of the surrounding nations. Besides the other lands already enumerated as belonging to the Persian Empire, *Egypt* claims notice – characteristically the Land of Ruins; a land which from hoar antiquity has been regarded with wonder, and which in recent times also has attracted the greatest interest. Its ruins, the final result of immense labor, surpass in the gigantic and monstrous, all that antiquity has left us.

In Egypt we see united the elements which in the Persian monarchy appeared singly. We found among the Persians the adoration of Light – regarded as the Essence of universal Nature. This principle then develops itself in phases which hold a position of indifference towards each other. The one is the immersion in the sensuous – among the Babylonians and Syrians ; the other is the Spiritual phase, which is twofold: first as the incipient consciousness of the concrete Spirit in the worship of Adonis, and then as pure and abstract thought among the Jews. In the former the concrete is deficient in unity; in the latter the concrete is altogether wanting. The next problem is then, to harmonize these contradictory elements; and this problem presents itself in Egypt. Of the representations which Egyptian Antiquity presents us with, one figure must be especially noticed, viz. *the*

Sphinx – in itself a riddle – an ambiguous form, half brute, half human. The Sphinx may be regarded as a symbol of the Egyptian Spirit. The human head looking out from the brute body, exhibits Spirit as it begins to emerge from the merely Natural – to tear itself loose therefrom and already to look more freely around it; without, however, entirely freeing itself from the fetters Nature had imposed. The innumerable edifices of the Egyptians are half below the ground, and half rise above it into the air. The whole land is divided into a kingdom of life and a kingdom of death. The colossal statue of *Memnon* resounds at the first glance of the young morning Sun; though it is not yet the free light of Spirit with which it vibrates. Written language is still a hieroglyphic; and its basis *is* only the sensuous image, not the letter itself.

Thus the memorials of Egypt themselves give us a multitude of forms and images that express its character; we recognize a Spirit in them which feels itself compressed; which utters itself, but only in a sensuous mode.

Egypt was always the Land of Marvels, and has remained so to the present day. It is from the Greeks especially that we get information respecting it, and chiefly from Herodotus. This intelligent historiographer himself visited the country of which he wished to give an account, and at its chief towns made acquaintance with the Egyptian priests. Of all that he saw and heard, he gives an accurate record; but the deeper symbolism of the Egyptian mythology he has refrained from unfolding. This he regards as something sacred, and respecting which he cannot so freely speak as of merely external objects. Besides him Diodorus Siculus is an authority of great importance; and among the Jewish historians, Josephus.

In their architecture and hieroglyphics, the thoughts and conceptions of the Egyptians are expressed. A national work in the department of language is wanting: and that not only to us, but to the Egyptians themselves; they could not have any, because they had not advanced to an understanding of

themselves. Nor was there any Egyptian history, until at last Ptolemy Philadelphus – he who had the sacred books of the Jews translated into Greek – prompted the High-Priest Manetho to write an Egyptian history. Of this we have only extracts – list of Kings; which however have occasioned the greatest perplexities and contradictory views. To become acquainted with Egypt, we must for the most part have recourse to the notices of the ancients, and the immense monuments that are left us. We find a number of granite walls on which hieroglyphics are graved, and the ancients have given us explanations of some of them, but which are quite insufficient. In recent times attention has especially been recalled to them, and after many efforts something at least of the hieroglyphic writing has been deciphered. The celebrated Englishman, *Thomas Young,* first suggested a method of discovery, and called attention to the fact, that there are small surfaces separated from the other hieroglyphics, and in which a Greek translation is perceptible. By comparison Young made out three names – Berenice, Cleopatra, and Ptolemy – and this was the first step in deciphering them. It was found at a later date, that a great part of the hieroglyphics are phonetic, that is, express sounds. Thus the figure of an eye denotes first the eye itself, but secondly the first letter of the Egyptian word that means "eye" (as in Hebrew the figure of a house, ב, denotes the letter *b,* with which the word תןש, House, begins). The celebrated *Champollion* (the younger), first called attention to the fact that the phonetic hieroglyphs are intermingled with those which mark conceptions; and thus classified the hieroglyphs and established settled principles for deciphering them.

The *History* of Egypt, as we have it, is full of the greatest contradictions. The Mythical is blended with the Historical, and the statements are as diverse as can be imagined. European literati have eagerly investigated the lists given by Manetho and have relied upon them, and several names of kings have been confirmed by the recent discoveries. Herodotus says that

according to the statements of the priests, gods had formerly reigned over Egypt, and that from the first human king down to the King Setho 341 generations, or 11,340 years, had passed away; but that the first human ruler was Menes (the resemblance of the name to the Greek Minos and the Hindoo Manu is striking). With the exception of the Thebaid – its most southern part – Egypt was said by them to have formed a lake; the Delta presents reliable evidence of having been produced by the silt of the Nile. As the Dutch have gained their territory from the sea, and have found means to sustain themselves upon it; so the Egyptians first acquired their country, and maintained its fertility by canals and lakes. An important feature in the history of Egypt is its descent from Upper to Lower Egypt – from the South to the North. With this is connected the consideration that Egypt probably received its culture from Ethiopia; principally from the island Meroe, which, according to recent hypotheses, was occupied by a sacerdotal people. Thebes in Upper Egypt was the most ancient residence of the Egyptian kings. Even in Herodotus's time it was in a state of dilapidation. The ruins of this city present the most enormous specimens of Egyptian architecture that we are acquainted with. Considering their antiquity they are remarkably well preserved: which is partly owing to the perpetually cloudless sky. The centre of the kingdom was then transferred to Memphis, not far from the modern Cairo; and lastly to Sais, in the Delta itself. The structures that occur in the locality of this city are of very late date and imperfectly preserved. Herodotus tells us that Memphis was referred to so remote a founder as Menes. Among the later kings must be especially noticed Sesostris, who, according to Champollion, is Rameses the Great. To him in particular are referred a number of monuments and pictures in which are depicted his triumphal processions, and the captives taken in battle. Herodotus speaks of his conquests in Syria, extending even to Colchis; and illustrates his statement by the great similarity between the

manners of the Colchians and those of the Egyptians; these two nations and the Ethiopians were the only ones that had always practised circumcision. Herodotus says, moreover, that Sesostris had vast canals dug through the whole of Egypt, which served to convey the water of the Nile to every part. It may be generally remarked that the more provident the government in Egypt was, so much the more regard did it pay to the maintenance of the canals, while under negligent governments the desert got the upper hand; for Egypt was engaged in a constant struggle with the fierceness of the heat and with the water of the Nile. It appears from Herodotus, that the country had become impassable for cavalry in consequence of the canals; while, on the contrary, we see from the books of Moses, how celebrated Egypt once was in this respect. Moses says that if the Jews desired a king, he must not marry too many wives, nor send for horses from Egypt.

Next to Sesostris the Kings Cheops and Chephren deserve special mention. They are said to have built enormous pyramids and closed the temples of the priests. A son of Cheops – Mycerinus – is said to have reopened them; after him the Ethiopians invaded the country, and their king, Sabaco, made himself sovereign of Egypt. But Anysis, the successor of Mycerinus, fled into the marshes – to the mouth of the Nile; only after the departure of the Ethiopians did he make his appearance again. He was succeeded by Setho, who had been a priest of Phtha (supposed to be the same as Hephaestus): under his government, Sennacherib, King of the Assyrians, invaded the country. Setho had always treated the warrior-caste with great disrespect, and even robbed them of their lands; and when he invoked their assistance, they refused it. He was obliged therefore to issue a general summons to the Egyptians, and assembled a host composed of hucksters, artisans, and market people. In the Bible we are told that the enemies fled, and that it was the angels who routed them; but Herodotus relates that field mice came in the night and gnawed the quivers and bows

of the enemy, so that the latter, deprived of their weapons, were compelled to flee. After the death of Setho, the Egyptians (Herodotus tells us) regarded themselves as free, and chose themselves twelve kings, who formed a federal union – as a symbol of which they built the Labyrinth, consisting of an immense number of rooms and halls above and below ground. In the year 650 B.C. one of these kings, Psammitichus, with the help of the Ionians and Carians (to whom he promised land in Lower Egypt), expelled the eleven other kings. Till that time Egypt had remained secluded from the rest of the world; and at sea it had established no connection with other nations. Psammitichus commenced such a connection, and thereby led the way to the ruin of Egypt. From this point the history becomes clearer, because it is based on Greek accounts. Psammitichus was followed by Necho, who began to dig a canal, which was to unite the Nile with the Red Sea, but which was not completed until the reign of Darius Nothus. The plan of uniting the Mediterranean Sea with the Arabian Gulf, and the wide ocean, is not so advantageous as might be supposed; since in the Red Sea – which on other accounts is very difficult to navigate – there prevails for about nine months in the year a constant north wind, so that it is only during three months that the passage from south to north is feasible. Necho was followed by Psammis, and the latter by Apries, who led an army against Sidon, and engaged with the Tyrians by sea: against Cyrene also he sent an army, which was almost annihilated by the Cyrenians. The Egyptians rebelled against him, accusing him of wishing to lead them to destruction; but this revolt was probably caused by the favor shown by him to the Carians and Ionians. Amasis placed himself at the head of the rebels, conquered the king, and possessed himself of the throne. By Herodotus he is depicted as a humorous monarch, who, however, did not always maintain the dignity of the throne. From a very humble station he had raised himself to royalty by ability, astuteness, and intelligence, and he exhibited in all

other relations the same keen understanding. In the morning he held his court of judicature, and listened to the complaints of the people; but in the afternoon, feasted and surrendered himself to pleasure. To his friends, who blamed him on this account, and told him that he ought to give the whole day to business, he made answer: "If the bow is constantly on the stretch, it becomes useless or breaks." As the Egyptians thought less of him on account of his mean descent, he had a golden basin – used for washing the feet – made into the image of a god in high honor among the Egyptians; this he meant as a symbol of his own elevation. Herodotus relates, moreover, that he indulged in excesses as a private man, dissipated the whole of his property, and then betook himself to stealing. This contrast of a vulgar soul and a keen intellect is characteristic in an Egyptian king.

Amasis drew down upon him the ill-will of King Cambyses. Cyrus desired an oculist from the Egyptians; for at that time the Egyptian oculists were very famous, their skill having been called out by the numerous eye-diseases prevalent in Egypt. This oculist, to revenge himself for having been sent out of the country, advised Cambyses to ask for the daughter of Amasis in marriage; knowing well that Amasis would either be rendered unhappy by giving her to him, or on the other hand, incur the wrath of Cambyses by refusing. Amasis would not give his daughter to Cambyses. because the latter desired her as an inferior wife (for his lawful spouse must be a Persian) ; but sent him, under the name of his own daughter, that of Apries, who afterwards discovered her real name to Cambyses. The latter was so incensed at the deception, that he led an expedition against Egypt, conquered that country, and united it with the Persian Empire.

As to the Egyptian *Spirit,* it deserves mention here, that the Elians in Herodotus's narrative call the Egyptians the wisest of mankind. It also surprises us to find among them, in the vicinity of African stupidity, reflective intelligence, a thoroughly rational organization characterizing all

institutions, and most astonishing works of art. The Egyptians were, like the Hindoos, divided into castes, and the children always continued the trade and business of their parents. On this account, also, the Mechanical and Technical in the arts was so much developed here; while the hereditary transmission of occupations did not produce the same disadvantageous results in the character of the Egyptians as in India. Herodotus mentions the seven following castes: the priests, the warriors, the neatherds, the swineherds, the merchants (or trading population generally), the interpreters – who seem only at a later date to have constituted a separate class – and, lastly, the seafaring class. Agriculturists are not named here, probably because agriculture was the occupation of several castes, as, *e.g.,* the warriors, to whom a portion of the land was given. Diodorus and Strabo give a different account of these caste-divisions. Only priests, warriors, herdsmen, agriculturists, and artificers are mentioned, to which latter, perhaps, tradesmen also belong. Herodotus says of the priests, that they in particular received arable land, and had it cultivated for rent; for the land generally was in the possession of the priests, warriors, and kings. Joseph was a minister of the king, according to Holy Scripture, and contrived to make him master of all landed property. But the several occupations did not remain so stereotyped as among the Hindoos; for we find the Israelites, who were originally herdsmen, employed also as manual laborers: and there was a king – as stated above – who formed an army of manual laborers alone. The castes are not rigidly fixed, but struggle with and come into contact with one another: we often find cases of their being broken up and in a state of rebellion. The warrior- caste, at one time discontented on account of their not being released from their abodes in the direction of Nubia, and desperate at not being able to make use of their lands, betake themselves to Meroë, and foreign mercenaries are introduced into the country.

Of the *mode of life* among the Egyptians, Herodotus supplies a very detailed account, giving prominence to everything which appears to him to deviate from Greek manners. Thus the Egyptians had physicians specially devoted to particular diseases; the women were engaged in outdoor occupations, while the men remained at home to weave. In one part of Egypt polygamy prevailed; in another, monogamy; the women had but one garment, the men two; they wash and bathe much, and undergo purification every month. All this points to a condition of settled peace. As to arrangements of police, the law required that every Egyptian should present himself, at a time appointed, before the superintendent under whom he lived, and state from what resources he obtained his livelihood. If he could not refer to any, he was punished with death. This law, however, was of no earlier date than Amasis. The greatest care, moreover, was observed in the division of the arable land, as also in planning canals and dikes; under Sabaco, the Ethiopian king, says Herodotus, many cities were elevated by dikes.

The business of *courts of justice* was administered with very great care. They consisted of thirty judges nominated by the district, and who chose their own president. Pleadings were conducted in writing, and proceeded as far as the "rejoinder." Diodorus thinks this plan very effectual, in obviating the perverting influence of forensic oratory, and of the sympathy of the judges. The latter pronounced sentence silently, and in a hieroglyphical manner. Herodotus says, that they had a symbol of truth on their breasts, and turned it towards that side in whose favor the cause was decided, or adorned the victorious party with it. The king himself had to take part in judicial business every day. Theft, we are told, was forbidden; but the law commanded that thieves should inform against themselves. If they did so, they were not punished, but, on the contrary, were allowed to keep a fourth

part of what they had stolen. This perhaps was designed to excite and keep in exercise that cunning for which the Egyptians were so celebrated.

The *intelligence* displayed in their legislative economy, appears characteristic of the Egyptians. This intelligence, which manifests itself in the practical, we also recognize in the productions of art and science. The Egyptians are reported to have divided the year into twelve months, and each month into thirty days. At the end of the year they intercalated five additional days, and Herodotus says that their arrangement was better than that of the Greeks. The intelligence of the Egyptians especially strikes us in the department of mechanics. Their vast edifices – such as no other nation has to exhibit, and which excel all others in solidity and size – sufficiently prove their artistic skill; to whose cultivation they could largely devote themselves, because the inferior castes did not trouble themselves with political matters. Diodorus Siculus says, that Egypt was the only country in which the citizens did not trouble themselves about the state, but gave their whole attention to their private business. Greeks and Romans must have been especially astonished at such a state of things.

On account of its judicious economy, Egypt was regarded by the ancients as the pattern of a morally regulated condition of things – as an ideal such as Pythagoras realized in a limited select society, and Plato sketched on a larger scale. But in such ideals no account is taken of passion. A plan of society that is to be adopted and acted upon, as an absolutely complete one – in which everything has been considered, and especially the education and habituation to it, necessary to its becoming a second nature – is altogether opposed to the nature of Spirit, which makes contemporary life the object on which it acts; itself being the infinite impulse of activity to alter its forms. This impulse also expressed itself in Egypt in a peculiar way. It would appear at first as if a condition of things so regular, so determinate in every particular, contained nothing that had a peculiarity entirely its own.

The introduction of a religious element would seem to be an affair of no critical moment, provided the higher necessities of men were satisfied; we should in fact rather expect that it would be introduced in a peaceful way and in accordance with the moral arrangement of things already mentioned. But in contemplating the *Religion* of the Egyptians, we are surprised by the strangest and most wonderful phenomena, and perceive that this calm order of things, bound fast by legislative enactment, is not like that of the Chinese, but that we have here to do with a Spirit entirely different – one full of stirring and urgent impulses. We have here the African element, in combination with Oriental massiveness, transplanted to the Mediterranean Sea, that grand *locale* of the display of nationalities; but in such a manner, that here there is no connection with foreign nations – this mode of stimulating intellect appearing superfluous; for we have here a prodigious urgent striving within the nationality itself, and which within its own circle shoots out into an objective realization of itself in the most monstrous productions. It is that African imprisonment of ideas combined with the infinite impulse of the spirit to realize itself objectively, which we find here. But Spirit has still, as it were, an iron band around its forehead; so that it cannot attain to the free consciousness of its existence, but produces this only as the problem, the enigma of its being.

The fundamental conception of that which the Egyptians regard as the essence of being, rests on the determinate character of the natural world, in which they live; and more particularly on the determinate physical circle which the Nile and the Sun mark out. These two are strictly connected – the position of the Sun and that of the Nile; and to the Egyptian this is all in all. The Nile is that which essentially determines the boundaries of the country; beyond the Nile- valley begins the desert; on the north, Egypt is shut in by the sea, and on the south by torrid heat. The first Arab leader that conquered Egypt, writes to the Caliph Omar: “Egypt is first a vast sea of dust; then a

sea of fresh water; lastly, it is a great sea of flowers. It never rains there; towards the end of July dew falls, and then the Nile begins to overflow its banks, and Egypt resembles a sea of islands." (Herodotus compares Egypt, during this period, with the islands in the Ægean.) The Nile leaves behind it prodigious multitudes of living creatures: then appear moving and creeping things innumerable; soon after, man begins to sow the ground, and the harvest is very abundant. Thus the existence of the Egyptian does not depend on the brightness of the sun, or the quantity of rain. For him, on the contrary, there exist only those perfectly simple conditions, which form the basis of his mode of life and its occupations. There is a definite physical cycle, which the Nile pursues, and which is connected with the course of the Sun; the latter advances, reaches its culmination, and then retrogrades. So also does the Nile.

This basis of the life of the Egyptians determines moreover the particular tenor of their religious views. A controversy has long been waged respecting the sense of meaning of the Egyptian religion. As early as the reign of Tiberius, the Stoic Chaeremon, who had been in Egypt, explains it in a purely materialistic sense. The New Platonists take a directly opposite view, regarding all as symbols of a spiritual meaning, and thus making this religion a pure Idealism. Each of these representations is one-sided. Natural and spiritual powers are regarded as most intimately united – (the free spiritual import, however, has *not* been developed at this stage of thought) – but in such a way, that the extremes of the antithesis were united in the harshest contrast. We have spoken of the Nile, of the Sun, and of the vegetation depending upon them. This limited view of Nature gives the principle of the religion, and its subject-matter is primarily a history. The Nile and the Sun constitute the divinities, conceived under human forms; and the course of nature and the mythological history is the same. In the winter solstice the power of the sun has reached its minimum, and must be

born anew. Thus also Osiris appears as born; but he is killed by Typhon – his brother and enemy – the burning wind of the desert. Isis, the Earth – from whom the aid of the Sun and of the Nile has been withdrawn – yearns after him: she gathers the scattered bones of Osiris, and raises her lamentation for him, and all Egypt bewails with her the death of Osiris, in a song which Herodotus calls Maneros. Maneros he reports to have been the only son of the first king of the Egyptians, and to have died prematurely; this song being also the Linus- Song of the Greeks, and the only song which the Egyptians have. Here again pain is regarded as something divine, and the same honor is assigned to it here as among the Phoenicians. Hermes then embalms Osiris; and his grave is shown in various places. Osiris is now judge of the dead, and lord of the kingdom of the Shades. These are the leading ideas. Osiris, the Sun, the Nile; this triplicity of being is united in one knot. The Sun is the symbol, in which Osiris and the history of that god are recognized, and the Nile is likewise such a symbol. The concrete Egyptian imagination also ascribes to Osiris and Isis the introduction of agriculture, the invention of the plough, the hoe, etc.; for Osiris gives not only the useful itself – the fertility of the earth – but, moreover, the means of making use of it. He also gives men laws, a civil order and a religious ritual; he thus places in men's hands the means of labor, and secures its result. Osiris *is* also the symbol of the seed which is placed in the earth, and then springs up – as also of the course of life. Thus we find this heterogeneous duality – the phenomena of Nature and the Spiritual – woven together into *one* knot.

The parallelism of the course of human life with the Nile, the Sun and Osiris, is not to be regarded as a mere allegory – as if the principle of birth, of increase in strength, of the culmination of vigor and fertility, of decline and weakness, exhibited itself in these different phenomena, in an equal or similar way; but in this variety imagination conceived only *one subject,* one

vitality. This unity is, however, quite abstract: the heterogeneous element shows itself therein as pressing and urging, and in a confusion which sharply contrasts with Greek perspicuity. Osiris represents the Nile and the Sun: Sun and Nile are, on the other hand, symbols of human life – each one is signification and symbol at the same time; the symbol is changed into signification, and this latter becomes symbol of that symbol, which itself then becomes signification. None of these phases of existence is a Type without being at the same time a Signification; each is both; the one is explained by the other. Thus there arises one pregnant conception, composed of many conceptions, in which each fundamental nodus retains its individuality, so that they are not resolved into a general idea. The general idea – the thought itself, which forms the bond of analogy – does not present itself to the consciousness purely and freely as such, but remains concealed as an internal connection. We have a consolidated individuality, combining various phenomenal aspects; and which on the one hand is fanciful, on account of the combination of apparently disparate material, but on the other hand internally and essentially connected, because these various appearances are a particular prosaic matter of fact.

Besides this fundamental conception, we observe several special divinities, of whom Herodotus reckons three classes. Of the first he mentions eight gods; of the second twelve; of the third an indefinite number, who occupy the position towards the unity of Osiris of specific manifestations. In the first class, Fire and its use appears as Phtha, also as Knef, who is besides represented as the Good Genius; but the Nile itself is held to be that Genius, and thus abstractions are changed into concrete conceptions. *Amman* is regarded as a great divinity, with whom is associated the determination of the equinox: it is he, moreover, who gives oracles. But Osiris is similarly represented as the founder of oracular manifestations. So the Procreative Power, banished by Osiris, is represented

as a particular divinity. But Osiris is himself this Procreative Power. Isis is the Earth, the Moon, the receptive fertility of Nature. As an important element in the conception Osiris, *Anubis* (*Thoth*) – the Egyptian Hermes – must be specially noticed. In human activity and invention, and in the economy of legislation, the Spiritual, as such, is embodied; and becomes in this form – which is itself determinate and limited – an object of consciousness. Here we have the Spiritual, not as one infinite, independent sovereignty over nature, but as a particular existence, side by side with the powers of Nature – characterized also by intrinsic particularity. And thus the Egyptians had also specific divinities, conceived as spiritual activities and forces; but partly *intrinsically* limited – partly [so, as] contemplated under natural symbols.

The Egyptian Hermes is celebrated as exhibiting the spiritual side of their theism. According to Jamblichus, the Egyptian priests immemorially prefixed to all their inventions the name Hermes: Eratosthenes, therefore, called his book, which treated of the entire science of Egypt – "Hermes." Anubis is called the friend and companion of Osiris. To him is ascribed the invention of writing, and of science generally – of , grammar, astronomy, mensuration, music, and medicine. It was he who first divided the day into twelve hours: he was moreover the first lawgiver, the first instructor in religious observances and objects, and in gymnastics and orchestics; and it was he who discovered the olive. But, notwithstanding all these spiritual attributes, this divinity is something quite other than the God of Thought. Only particular human arts and inventions are associated with him. Not only so; but he entirely falls back into involvement in existence, and is degraded under physical symbols. He is represented with a dog's head, as an imbruted god; and besides this mask, a particular natural object is bound up with the conception of this divinity; for he is at the same time Sirius, the Dog-Star. He is thus as limited in respect of what he embodies, as sensuous in the

positive existence ascribed to him. It may be incidentally remarked, that as Ideas and Nature are not distinguished from each other, in the same way the arts and appliances of human life are not developed and arranged so as to form a rational circle of aims and means. Thus medicine – deliberation respecting corporeal disease – as also the whole range of deliberation and resolve with regard to undertakings in life – was subjected to the most multifarious superstition in the way of reliance on oracles and magic arts. Astronomy was also essentially Astrology, and Medicine an affair of magic, but more particularly of Astrology. All astrological and sympathetic superstition may be traced to Egypt.

Egyptian *Worship* is chiefly Zoolatry. We have observed the union here presented between the Spiritual and the Natural: the more advanced and elevated side of this conception is the fact that the Egyptians, while they observed the Spiritual as manifested in the Nile, the Sun, and the sowing of seed, took the same view of the life of animals. To us Zoolatry is repulsive. We may reconcile ourselves to the adoration of the material heaven, but the worship of brutes is alien to us; for the abstract natural element seems to us more generic, and therefore more worthy of veneration. Yet it is certain that the nations who worshipped the Sun and the Stars by no means occupy a higher grade than those who adore brutes, but contrariwise ; for in the brute world the Egyptians contemplate a hidden and incomprehensible principle.

We also, when we contemplate the life and action of brutes, are astonished at their instinct – the adaptation of their movements to the object intended – their restlessness, excitability, and liveliness; for they are exceedingly quick and discerning in pursuing the ends of their existence, while they are at the same time silent and shut up within themselves. We cannot make out what it is that “possesses” these creatures, and cannot rely on them. A black tom-cat, with its glowing eyes and its now gliding, now quick and darting movement, has been deemed the presence of a malignant

being – a mysterious reserved spectre: the dog, the canary-bird, on the contrary, appear friendly and sympathizing. The lower animals are the truly Incomprehensible. A *man* cannot by imagination or conception enter into the nature of a *dog,* whatever resemblance he himself might have to it; it remains something altogether alien to him. It is in two departments that the so-called Incomprehensible meets us – in living Nature and in Spirit. But in very deed it is only in Nature that we have to encounter the Incomprehensible; for the being manifest to itself is the essence [supplies the very definition of], Spirit: Spirit understands and comprehends Spirit. The obtuse self-consciousness of the Egyptians, therefore, to which the thought of human freedom is not yet revealed, worships the soul as still shut up within and dulled by the physical organization, and sympathizes with brute life. We find a veneration of mere vitality among other nations also: sometimes expressly, as among the Hindoos and all the Mongolians; sometimes in mere traces, as among the Jews: "Thou shalt not eat the blood of animals, for in it is the life of the animal." The Greeks and Romans also regarded birds as specially intelligent, believing that what in the human spirit was not revealed – the Incomprehensible and Higher – was to be found in them. But among the Egyptians this worship of beasts was carried to excess under the forms of a most stupid and non-human superstition. The worship of brutes was among them a matter of particular and detailed arrangement: each district had a brute deity of its own – a cat, an ibis, a crocodile, etc. Great establishments were provided for them; beautiful *mates* were assigned them; and, like human beings, they were embalmed after death. The bulls were buried, but with their horns protruding above their graves; the bulls embodying *Apis* had splendid monuments, and some of the pyramids must be looked upon as such. In one of those that have been opened, there was found in the most central apartment a beautiful alabaster coffin; and on closer examination it was found that the bones inclosed were

those of the ox. This reverence for brutes was often carried to the most absurd excess of severity. If a man killed one designedly, he was punished with death; but even the undesigned killing of some animals might entail death. It is related, that once when a Roman in Alexandria killed a cat, an insurrection ensued, in which the Egyptians murdered the aggressor. They would let human beings perish by famine, rather than allow the sacred animals to be killed, or the provision made for them trenched upon. Still more than mere vitality, the universal *vis vitas* of productive nature was venerated in a Phallus-worship; which the Greeks also adopted into the rites paid by them to Dionysus. With this worship the greatest excesses were connected.

The brute form is, on the other hand, turned into a symbol: it is also partly degraded to a mere hieroglyphical sign. I refer here to the innumerable figures on the Egyptian monuments, of sparrow-hawks or falcons, dung-beetles, scarabaei, etc. It is not known what ideas such figures symbolized, and we can scarcely think that a satisfactory view of this very obscure subject is attainable. The dung-beetle is said to be the symbol of generation – of the sun and its course; the Ibis, that of the Nile's overflowing; birds of the hawk tribe, of prophecy – of the year – of pity. The strangeness of these combinations results from the circumstance that we have not, as in our idea of poetical invention, a general conception embodied in an image; but, conversely, we begin with a concept in the sphere of sense, and imagination conducts us into the same sphere again. But we observe the conception liberating itself from the direct animal form, and the continued contemplation of it; and that which was only surmised and aimed at in that form, advancing to comprehensibility and conceivableness. The hidden meaning – the Spiritual – emerges as a human face from the brute. The multiform sphinxes, with lions' bodies and virgins' heads – or as male sphinxes (androsfiggis) with beards – are evidence

supporting the view, that the meaning of the Spiritual is the problem which the Egyptians proposed to themselves; as the enigma generally is not the utterance of something unknown, but is the challenge to discover it – implying a wish to be revealed. But conversely, the human form is also disfigured by a brute face, with the view of giving it a specific and definite expression. The refined art of Greece is able to attain a specific expression through the spiritual character given to an image in the form of beauty, and does not need to deform the human face in order to be understood. The Egyptians appended an explanation to the human forms, even of the gods, by means of heads and masks of brutes; Anubis *e.g.,* has a dog's head, Isis, a lion's head with bull's horns, etc. The priests, also, in performing their functions, are masked as falcons, jackals, bulls, etc.; in the same way the surgeon, who has taken out the bowels of the dead (represented as fleeing, for he has laid sacrilegious hands on an object once hallowed by life) ; so also the embalmers and the scribes. The sparrow-hawk, with a human head and outspread wings, denotes the soul flying through material space, in order to animate a new body. The Egyptian imagination also created new forms – combinations of different animals: serpents with bulls' and rams' heads, bodies of lions with rams' heads, etc.

We thus see Egypt intellectually confined by a narrow, involved, close view of Nature, but breaking through this; impelling it to self-contradiction, and proposing to itself the problem which that contradiction implies. The [Egyptian] principle does not remain satisfied with its primary conditions, but points to that other meaning and spirit which lies concealed beneath the surface.

In the view just given, we saw the Egyptian Spirit working itself free from natural forms. This urging, powerful Spirit, however, was not able to rest in the subjective conception of that view of things which we have now been considering, but was impelled to present it to external consciousness

and outward vision by means of Art. – For the religion of the Eternal One – the Formless – Art is not only unsatisfying, but – since its *object* essentially and exclusively occupies the thought – something sinful. But Spirit, occupied with the contemplation of particular natural forms – being at the same time a striving and plastic Spirit – changes the direct, natural view, *e.g.,* of the Nile, the Sun, etc., to images, in which Spirit has a share. It is, as we have seen, symbolizing Spirit; and as such, it endeavors to master these symbolizations, and to present them clearly before the mind. The more enigmatical and obscure it is to itself, so much the more does it feel the impulse to labor to deliver itself from its imprisonment, and to gain a clear objective view of itself.

It is the distinguishing feature of the Egyptian Spirit, that it stands before us as this mighty taskmaster. It is not splendor, amusement, pleasure, or the like that it seeks. The force which urges it is the impulse of self-comprehension; and it has no other material or ground to work on, in order to teach itself what it is – to realize itself for itself – than this working out its thoughts in stone; and what it engraves on the stone are its enigmas – these hieroglyphs. They are of two kinds – hieroglyphs *proper,* designed rather to express language, and having reference to subjective conception; and a class of hieroglyphs of a different kind, viz., those enormous masses of architecture and sculpture, with which Egypt is covered. While among other nations history consists of a series of events – as, *e.g.,* that of the Romans, who century after century, lived only with a view to conquest, and accomplished the subjugation of the world – the Egyptians raised an empire equally mighty – of achievements in works of art, whose ruins prove their indestructibility, and which are greater and more worthy of astonishment than all other works of ancient or modern time.

Of these works I will mention no others than those devoted to the dead, and which especially attract our attention. These are the enormous

excavations in the hills along the Nile at Thebes, whose passages and chambers are entirely filled with mummies – subterranean abodes as large as the largest mining works of our time: next, the great field of the dead in the plain of Sais, with its walls and vaults: thirdly, those Wonders of the World, the Pyramids, whose destination, though stated long ago by Herodotus and Diodorus, has been only recently expressly confirmed – to the effect, viz., that these prodigious crystals, with their geometrical regularity, contain dead bodies: and lastly, that most astonishing work, the Tombs of the Kings, of which one has been opened by Belzoni in modern times. It is of essential moment to observe, what importance this realm of the dead had for the Egyptian: we may thence gather what idea he had of man. For in the Dead, man conceives of man as stripped of all adventitious wrappages – as reduced to his essential nature. But that which a people regards as man in his essential characteristics, that it is itself – such is its character. In the first place, we must here cite the remarkable fact which Herodotus tells us, viz., that the Egyptians were the first to express the thought that the soul of man is *immortal.* But this proposition that the soul is immortal is intended to mean that it is something other than Nature – that Spirit is inherently independent. The *ne plus ultra* of blessedness among the Hindoos, was the passing over into abstract unity – into Nothingness. On the other hand, subjectivity, when free, is inherently infinite: the Kingdom of free Spirit is therefore the Kingdom of the Invisible – such as Hades was conceived by the Greeks. This presents itself to men first as the empire of death – to the Egyptians as the *Realm of the Dead.*

The idea that Spirit is immortal, involves this – that the human individual inherently possesses infinite value. The merely Natural appears limited – absolutely dependent upon something other than itself – and has its existence in that other; but Immortality involves the inherent infinitude of Spirit. This idea is first found among the Egyptians. But it must be added,

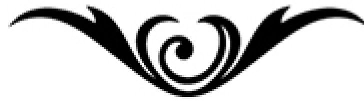
that the soul was known to the Egyptians previously only as an atom – that is, as something concrete and particular. For with that view is immediately connected the notion of Metempsychosis – the idea that the soul of man may also become the tenant of the body of a brute. Aristotle too speaks of this idea, and despatches it in few words. Every subject, he says, has its particular organs, for its peculiar mode of action: so the smith, the carpenter, each for his own craft. In like manner the human soul has its peculiar organs, and the body of a brute cannot be its domicile. Pythagoras adopted the doctrine of Metempsychosis; but it could not find much support among the Greeks, who held rather to the concrete. The Hindoos have also an indistinct conception of this doctrine, inasmuch as with them the final attainment is absorption in the universal Substance. But with the Egyptians the Soul – the Spirit – is, at any rate, an affirmative being, although only abstractedly affirmative. The period occupied by the soul's migrations was fixed at three thousand years; they affirmed, however, that a soul which had remained faithful to Osiris, was not subject to such a degradation – for such they deem it.

It is well known that the Egyptians embalmed their dead; and thus imparted such a degree of permanence, that they have been preserved even to the present day, and may continue as they are for many centuries to come. This indeed seems inconsistent with their idea of immortality; for if the soul has an independent existence, the permanence of the body seems a matter of indifference. But on the other hand it may be said, that if the soul is recognized as a permanent existence, honor should be shown to the body, as its former abode. The Parsees lay the bodies of the dead in exposed places to be devoured by birds; but among them the soul is regarded as passing forth into universal existence. Where the soul is supposed to enjoy continued existence, the body must also be considered to have some kind of connection with this continuance. Among us, indeed, the doctrine of the

Immortality of the Soul assumes the higher form: Spirit is in and for itself eternal; its destiny is eternal blessedness. – The Egyptians made their dead into mummies; and did not occupy themselves further with them; no honor was paid them beyond this. Herodotus relates of the Egyptians, that when any person died, the women went about loudly lamenting; but the idea of Immortality is not regarded in the light of a consolation, as among us.

From what was said above, respecting the works for the Dead, it is evident that the Egyptians, and especially their kings, made it the business of their life to build their sepulchre, and to give their bodies a permanent abode. It is remarkable that what had been needed for the business of life, was buried with the dead. Thus the craftsman had his tools: designs on the coffin show the occupation to which the deceased had devoted himself; so that we are able to become acquainted with him in all the *minutia* of his condition and employment. Many mummies have been found with a roll of papyrus under their arm, and this was formerly regarded as a remarkable treasure. But these rolls contain only various representations of the pursuits of life – together with writings in the Demotic character. They have been deciphered, and the discovery has been made, that they are all deeds of purchase, relating to pieces of ground and the like; in which everything is most minutely recorded – even the duties that had to be paid to the royal chancery on the occasion. What, therefore, a person bought during his life, is made to accompany him – in the shape of a legal document – in death. In this monumental way we are made acquainted with the private life of the Egyptians, as with that of the Romans through the ruins of Pompeii and Herculaneum.

After the death of an Egyptian, judgment was passed upon him. – One of the principal representations on the sarcophagi is this judicial process in the realm of the dead. Osiris – with Isis behind him – appears, holding a balance, while before him stands the soul of the deceased. But judgment



was passed on the dead by the living themselves; and that not merely in the case of private persons, but even of kings. The tomb of a certain king has been discovered – very large, and elaborate in its architecture – in whose hieroglyphs the name of the principal person is obliterated, while in the bas-reliefs and pictorial designs the chief figure is erased. This has been explained to import that the honor of being thus immortalized, was refused this king by the sentence of the Court of the Dead.

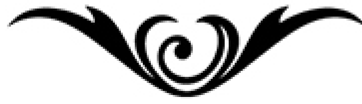
If Death thus haunted the minds of the Egyptians during life, it might be supposed that their disposition was melancholy. But the thought of death by no means occasioned depression. At banquets they had representations of the dead (as Herodotus relates), with the admonition: "Eat and drink – such a one wilt thou become, when thou art dead." Death was thus to them rather a call to enjoy Life. Osiris himself dies, and goes down into the realm of death, according to the above-mentioned Egyptian myth. In many places in Egypt, the sacred grave of Osiris was exhibited. But he was also represented as president of the Kingdom of the Invisible Sphere, and as judge of the dead in it; later on, Serapis exercised this function in his place. Of Anubis-Hermes the myth says, that he embalmed the body of Osiris: this Anubis sustained also the office of leader of the souls of the dead; and in the pictorial representations he stands, with a writing tablet in his hand, by the side of Osiris. The reception of the dead into the Kingdom of Osiris had also a profounder import, viz., that the individual was united with Osiris. On the lids of the sarcophagi, therefore, the defunct is represented as having himself become Osiris; and in deciphering the hieroglyphs, the idea has been suggested that the kings are called gods. The human and the divine are thus exhibited as united. If, in conclusion, we combine what has been said here of the peculiarities of the Egyptian Spirit in all its aspects, its pervading principle is found to be, that the two elements of reality – Spirit sunk in Nature, and the impulse to liberate it – are here held together

inharmoniously as contending elements. We behold the antithesis of Nature and Spirit – not the primary Immediate Unity [as in the less advanced nations], nor the Concrete Unity, where Nature is posited only as a basis for the manifestation of Spirit [as in the more advanced] ; in contrast with the first and second of these Unities, the Egyptian Unity – combining contradictory elements – occupies a middle place. The two sides of this unity are held in abstract independence of each other, and their veritable union presented only as a problem. We have, therefore, on the *one* side, prodigious confusion and limitation to the particular; barbarous sensuality with African hardness, Zoolatry, and sensual enjoyment. It is stated that, in a public market-place, sodomy was Committed by a woman with a goat. Juvenal relates that human flesh was eaten and human blood drunk out of revenge. The *other* side is the struggle of Spirit for liberation – fancy displayed in the forms created by art, together with the abstract understanding shown in the mechanical labors connected with their production. The same intelligence – the power of altering the form of individual existences, and that steadfast thoughtfulness which can rise above mere phenomena – shows itself in their police and the mechanism of the State, in agricultural economy, etc.; and the contrast to this is the severity with which their customs bind them, and the superstition to which humanity among them is inexorably subject. With a clear understanding of the present, is connected the highest degree of impulsiveness, daring and turbulence. These features are combined in the stories which Herodotus relates to us of the Egyptians. They much resemble the tales of the Thousand and One Nights; and although these have Bagdad as the locality of their narration, their origin is no more limited to this luxurious court, than to the Arabian people, but must be partly traced to Egypt – as *Von Hammer* also thinks. The Arabian world is quite other than the fanciful and enchanted region there described; it has much more simple passions and

interests. Love, Martial Daring, the Horse, the Sword, are the darling subjects of the poetry peculiar to the Arabians.

TRANSITION TO THE GREEK WORLD

THE EGYPTIAN SPIRIT has shown itself to us as in all respects shut up within the limits of particular conceptions, and, as it were, imbruted in them; but likewise stirring itself within these limits – passing restlessly from one particular form into another. This Spirit never rises to the Universal and Higher, for it seems to be blind to that; nor does it ever withdraw into itself: yet it symbolizes freely and boldly with particular existence, and has already mastered it. All that is now required is to posit that particular existence – which contains the germ of ideality – *as ideal,* and to comprehend Universality itself, which is already potentially liberated from the particulars involving it. It is the free, joyful Spirit of Greece that accomplishes this, and makes this its starting-point. An Egyptian priest is reported to have said, that the Greeks remain eternally children. We may say, on the contrary, that the Egyptians are vigorous *boys,* eager for self-comprehension, who require nothing but clear understanding of themselves in an ideal form, in order to become *Young Men.* In the Oriental Spirit there remains as a basis the massive substantiality of Spirit immersed in Nature. To the Egyptian Spirit it has become impossible – though it is still involved in infinite embarrassment – to remain contented with *that.* The rugged African nature disintegrated that primitive Unity, and lighted upon the problem whose solution is Free Spirit. That the Spirit of the Egyptians presented itself to their consciousness in the form of a *problem,* is evident from the celebrated inscription in the sanctuary of the Goddess Neith at Sais: "*I am that which is, that which was, and that which will be; no one has lifted my veil*." This inscription indicates the principle of the Egyptian Spirit; though the opinion has often been entertained, that its purport applies



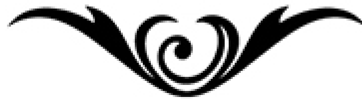
to all times. Proclus supplies the addition: “*The fruit which I have produced is Helios*.” That which is clear to itself is, therefore, the result of, and the solution of, the problem in question. This lucidity is Spirit – the Son of Neith the concealed night-loving divinity. In the Egyptian Neith, Truth is still a problem. The Greek Apollo is its solution; his utterance is: “*Man, know thyself*.” In this dictum is not intended a self-recognition that regards the specialities of one’s own weaknesses and defects: it is not the individual that is admonished to become acquainted with his idiosyncrasy, but humanity *in general* is summoned to self-knowledge. This mandate was given for the Greeks, and in the Greek Spirit humanity exhibits itself in its clear and developed condition. Wonderfully, then, must the Greek legend surprise us, which relates, that the Sphinx – the great Egyptian symbol – appeared in Thebes, uttering the words: “What is that which in the morning goes on four legs, at midday on two, and in the evening on three?” OEdipus, giving the solution, *Man,* precipitated the Sphinx from the rock. The solution and liberation of that Oriental Spirit, which in Egypt had advanced so far as to propose the problem, is certainly this: that the Inner Being [the Essence] of Nature is Thought, which has its existence only in the human consciousness. But that timehonored antique solution given by OEdipus – who thus shows himself possessed of knowledge – is connected with a dire ignorance of the character of his own actions. The rise of spiritual illumination in the old royal house is disparaged by connection with abominations, the result of ignorance; and that primeval royalty must – in order to attain true knowledge and moral clearness – first be brought into shapely form, and be harmonized with the Spirit of the Beautiful, by civil laws and political freedom.

The *inward* or ideal transition, from Egypt to Greece is as just exhibited. But Egypt became a province of the great Persian kingdom, and the *historical* transition takes place when the Persian world comes in contact

with the Greek. Here, for the first time, an historical transition meets us, viz. in the fall of an empire. China and India, as already mentioned, have remained – Persia has not. The transition to Greece is, indeed, internal; but here it shows itself also externally, as a transmission of sovereignty – an occurrence which from this time forward is ever and anon repeated. For the Greeks surrender the sceptre of dominion and of civilization to the Romans, and the Romans are subdued by the Germans. If we examine this fact of transition more closely, the question suggests itself – for example, in this first case of the kind, viz. Persia – why it sank, while China and India remain. In the first place we must here banish from our minds the prejudice in favor of duration, as if it had any advantage as compared with transience: the imperishable mountains are not superior to the quickly dismantled rose exhaling its life in fragrance. In Persia begins the principle of Free Spirit as contrasted with imprisonment in Nature; mere natural existence, therefore, loses its bloom, and fades away. The principle of separation from Nature is found in the Persian Empire, which, therefore, occupies a higher grade than those worlds immersed in the Natural. The necessity of advance has been thereby proclaimed. Spirit has disclosed its existence, and must complete its development. It is only when dead that the Chinese is held in reverence. The Hindoo kills himself – becomes absorbed in Brahm – undergoes a living death in the condition of perfect unconsciousness – or is a present god in virtue of his birth. Here we have no change; no advance is admissible, for progress is only possible through the recognition of the independence of Spirit. With the "Light" of the Persians begins a spiritual view of things, and here Spirit bids adieu to Nature. It is here, then, that we first find (as occasion called us to notice above) that the objective world remains free – that the nations are not enslaved, but are left in possession of their wealth, their political constitution, and their religion. And, indeed, this is the side on which Persia itself shows weakness as compared with Greece.

For we see that the Persians could erect no empire possessing complete organization; that they could not "inform" the conquered lands with their principle, and were unable to make them into a harmonious Whole, but were obliged to be content with an aggregate of the most diverse individualities. Among these nations the Persians secured no inward recognition of the legitimacy of their rule; they could not establish their legal principles of enactments, and in organizing their dominion, they only considered themselves, not the whole extent of their empire. Thus, as Persia did not constitute, politically, *one* Spirit, it appeared weak in contrast with Greece. It was not the effeminacy of the Persians (although, perhaps, Babylon infused an enervating element) that ruined them, but the unwieldy, unorganized character of their host, as matched against Greek organization; *i.e.,* the superior principle overcame the inferior. The abstract principle of the Persians displayed its defectiveness as an unorganized, incompacted union of disparate contradictories; in which the Persian doctrine of Light stood side by side with Syrian voluptuousness and luxury, with the activity and courage of the sea-braving Phoenicians, the abstraction of pure Thought in the Jewish Religion, and the mental unrest of Egypt; – an aggregate of elements, which awaited their idealization, and could receive it only in *free Individuality.* The Greeks must be looked upon as the people in whom these elements interpenetrated each other: Spirit became introspective, triumphed over particularity, and thereby emancipated itself.

PART II: THE GREEK WORLD



AMONG THE GREEKS we feel ourselves immediately at home, for we are in the region of Spirit; and though the origin of the nation, as also its philological peculiarities, may be traced farther – even to India – the proper Emergence, the true Palingenesis of Spirit must be looked for in Greece first. At an earlier stage I compared the Greek world with the period of adolescence; not, indeed, in *that* sense, that youth bears within it a serious, anticipative destiny, and consequently by the very conditions of its culture urges towards an ulterior aim – presenting thus an inherently incomplete and immature form, and being then most defective when it would deem itself perfect – but in *that* sense, that youth does not yet present the activity of work, does not yet exert itself for a definite intelligent aim – but rather exhibits a concrete freshness of the soul's life. It appears in the sensuous, actual world, as Incarnate Spirit and Spiritualized Sense – in a Unity which owed its origin to Spirit. Greece presents to us the cheerful aspect of youthful freshness, of Spiritual vitality. It is here first that advancing Spirit makes *itself* the content of its volition and its knowledge; but in such a way that State, Family, Law, Religion, are at the same time objects aimed at by individuality, while the latter *is* individuality only in virtue of those aims. The [full-grown] man, on the other hand, devotes his life to labor for an objective aim; which he pursues consistently, even at the cost of his individuality.

The highest form that floated before Greek imagination was Achilles, the Son of the Poet, the Homeric Youth of the Trojan War. Homer is the element in which the Greek world lives, as man does in the air. The Greek life is a truly youthful achievement. Achilles, the ideal youth, of *poetry,*

commenced it: Alexander the Great, the ideal youth of *reality,* concluded it. Both appear in contest with Asia. Achilles, as the principal figure in the national expedition of the Greeks against Troy, does not stand at its head, but is subject to the Chief of Chiefs; he cannot be made the leader without becoming a fantastic untenable conception. On the contrary, the second youth, Alexander – the freest and finest individuality that the real world has ever produced – advances to the head of this youthful life that has now perfected itself, and accomplishes the revenge against Asia. We have, then, to distinguish three periods in Greek history: the first, that of the growth of real Individuality; the second, that of its independence and prosperity in external conquest (through contact with the previous World-historical people); and the third, the period of its decline and fall, in its encounter with the succeeding organ of World-History. The period from its origin to its internal completeness (that which enables a people to make head against its predecessor) includes its primary culture. If the nation has a basis – such as the Greek world has in the Oriental – a foreign culture enters as an element into its primary condition, and it has a double culture, one original, the other of foreign suggestion. The uniting of these two elements constitutes its training; and the first period ends with the combination of its forces to produce its real and proper vigor, which then turns against the very element that had been its basis. The second period is that of victory and prosperity. But while the nation directs its energies outwards, it becomes unfaithful to its principles at home, and internal dissension follows upon the ceasing of the external excitement. In Art and Science, too, this shows itself in the separation of the Ideal from the Real. Here is the point of decline. The third period is that of ruin, through contact with the nation that embodies a higher Spirit. The same process, it may be stated once for all, will meet us in the life of every world-historical people.

SECTION I: THE ELEMENTS OF THE GREEK SPIRIT.

GREECE IS [THAT form of] the Substantial [*i.e.,* of Moral and Intellectual *Principle*], which is at the same time *individual.* The Universal [the Abstract], as such, is overcome; the submersion in Nature no longer exists, and consentaneously the unwieldy character of *geographical* relations has also vanished. The country now under consideration is a section of territory spreading itself in various forms through the sea – a multitude of islands, and a continent which itself exhibits insular features. The Peloponnesus is connected with the continent only by a narrow isthmus: the whole of Greece is indented by bays in numberless shapes. The partition into small divisions of territory is the universal characteristic, while at the same time, the relationship and connection between them is facilitated by the sea. We find here mountains, plains, valleys, and streams of limited extent: no great river, no absolute Valley-Plain presents itself; but the ground is diversified by mountains and rivers in such a way as to allow no prominence to a single massive feature. We see no such display of physical grandeur as is exhibited in the East – no stream such as the Ganges, the Indus, etc., on whose plains a race delivered over to monotony is stimulated to no change, because its horizon always exhibits one unvarying form. On the contrary, that divided and multiform character everywhere prevails which perfectly corresponds with the varied life of Greek races and the versatility of the Greek Spirit.

This is the *elementary character* of the Spirit of the Greeks, implying the origination of their culture from independent individualities; – a condition in which individuals take their own ground, and are not, from the very beginning, patriarchally united by a bond of *Nature,* but realize a union through some origin of their moral life the Greeks have preserved, with

grateful recollection, in a form of recognition which we may call mythological. In their mythology we have a definite record of the introduction of agriculture by Triptolemus, who was instructed by Ceres, and of the institution of marriage, etc. Prometheus, whose origin is referred to the distant Caucasus, is celebrated as having first taught men the production and the use of fire. The introduction of iron was likewise of great importance to the Greeks; and while Homer speaks only of bronze, Æschylus calls iron “Scythian.” The introduction of the olive, of the art of spinning and weaving, and the creation of the horse by Poseidon, belong to the same category.

More historical than these rudiments of culture is the alleged arrival of *foreigners;* tradition tells us how the various states were founded by such foreigners. Thus, Athens owes its origin to Cecrops, an Egyptian, whose history, however, is involved in obscurity. The race of Deucalion, the son of Prometheus, is brought into connection with the various Greek tribes. Pelops of Phrygia, the son of Tantalus, is also mentioned ; next, Danaus, from Egypt: from him descend Acrisius, Danae, and Perseus. Pelops is said to have brought great wealth with him to the Peloponnesus, and to have acquired great respect and power there. Danaus settled in Argos. Especially important is the arrival of Cadmus, of Phoenician origin, with whom phonetic writing is said to have been introduced into Greece; Herodotus refers it to Phoenicia, and ancient inscriptions then extant are cited to support the assertion. Cadmus, according to the legend, founded Thebes.

We thus observe a colonization by civilized peoples, who were in advance of the Greeks in point of culture: though we cannot compare this colonization with that of the English in North America, for the latter have not been blended with the aborigines, but have dispossessed them; whereas in the case of the settlers in Greece the adventitious and autochthonic elements were mixed together. The date assigned to the arrival of these

colonists is very remote – the fourteenth and fifteenth century before Christ. Cadmus is said to have founded Thebes about 1490 B.C. – a date with which the Exodus of Moses from Egypt (1500 B.C.) nearly coincides. Amphictyon is also mentioned among the Founders of Greek institutions; he is said to have established at Thermopylae a union between many small tribes of Hellas proper and Thessaly – a combination with which the great Amphictyonic league is said to have originated. These foreigners, then, are reputed to have established fixed *centres* in Greece by the erection of fortresses and the founding of royal houses. In Argolis, the walls of which the ancient fortresses consisted, were called Cyclopian; some of them have been discovered even in recent times, since, on account of their solidity, they are indestructible.

These walls consist partly of irregular blocks, whose interstices are filled up with small stones – partly of masses of stones carefully fitted into each other. Such walls are those of Tiryns and Mycenae. Even now the gate with the lions, at Mycenas, can be recognized by the description of Pausanias. It is stated of Prcetus, who ruled in Argos, that he brought with him from Lycia the Cyclopes who built these walls. It is, however, supposed that they were erected by the ancient Pelasgi. To the fortresses protected by such walls the princes of the heroic times generally attached their dwellings. Especially remarkable are the Treasure-houses built by them, such as the Treasure-house of Minyas at Orchomenus, and that of Atreus at Mycenas. These fortresses, then, were the nuclei of small states; they gave a greater security to agriculture; they protected commercial intercourse against robbery. They were, however, as Thucydides informs us, not placed in the immediate vicinity of the sea, on account of piracy; maritime towns being of later date. Thus with those royal abodes originated the firm establishment of society. The relation of princes to subjects, and to each other, we learn best from Homer. It did not depend on a state of things established by law,

but. on superiority in riches, possessions, martial accoutrements, personal bravery, pre-eminence in insight and wisdom, and lastly, on descent and ancestry; for the princes, as heroes, were regarded as of a higher race. Their subjects obeyed them, not as distinguished from them by conditions of Caste, nor as in a state of serfdom, nor in the patriarchal relation – according to which the chief is only the head of the tribe or family to which all belong – nor yet as the result of the express necessity for a constitutional government; but only from the need, universally felt, of being held together, and of obeying a ruler accustomed to command – without envy and ill-will towards him. The Prince has just so much personal authority as he possesses the ability to acquire and to assert; but as this superiority is only the individually heroic, resting on personal merit, it does not continue long. Thus in Homer we see the suitors of Penelope taking possession of the property of the absent Ulysses, without showing the slightest respect to his son. Achilles, in his inquiries about his father, when Ulysses descends to Hades, indicates the supposition that, as he is old, he will be no longer honored. Manners are still very simple: princes prepare their own repasts; and Ulysses labors at the construction of his own house. In Homer's Iliad we find a King of Kings, a generalissimo in the great national undertaking – but the other magnates environ him as a freely deliberating council; the prince is honored, but he is obliged to arrange everything to the satisfaction of the others; he indulges in violent conduct towards Achilles, but, in revenge, the latter withdraws from the struggle. Equally lax is the relation of the several chiefs to the people at large, among whom there are always individuals who claim attention and respect. The various peoples do not fight as mercenaries of the prince in his battles, nor as a stupid serf-like herd driven to the contest, nor yet in their own interest; but as the companions of their honored chieftain – as witnesses of his exploits, and his defenders in peril. A perfect resemblance to these relations is also presented

in the Greek Pantheon. Zeus is the Father of the Gods, but each one of them has his own will; Zeus respects them, and they him: he may sometimes scold and threaten them, and they then allow his will to prevail or retreat grumbling; but they do not permit matters to come to an extremity, and Zeus so arranges matters on the whole – by making this concession to one, that to another – as to produce satisfaction. In the terrestrial, as well as in the Olympian world, there is, therefore, only a lax bond of unity maintained; royalty has not yet become monarchy, for it is only in a more extensive society that the need of the latter is felt.

While this state of things prevailed, and social relations were such as have been described, that striking and great event took place – the union of the whole of Greece in a national undertaking, viz., the *Trojan War;* with which began that more extensive connection, with Asia which had very important results for the Greeks. (The expedition of Jason to Colchis – also mentioned by the poets – and which bears an earlier date, was, as compared with the war of Troy, a very limited and isolated undertaking.) The occasion of that united expedition is said to have been the violation of the laws of hospitality by the son of an Asiatic prince, in carrying off the wife of his host. Agamemnon assembles the princes of Greece through the power and influence which he possesses. Thucydides ascribes his authority to his hereditary sovereignty, combined with naval power (Hom. II. ii. 108), in which he was far superior to the rest. It appears, however, that the combination was effected without external compulsion, and that the whole armament was convened simply on the strength of individual consent. The Hellenes were then brought to act unitedly, to an extent of which there is no subsequent example. The result of their exertions was the conquest and destruction of Troy, though they had no design of making it a permanent possession. No external result, therefore, in the way of settlement ensued, any more than an enduring political union, as the effect of the uniting of the

nation in the accomplishment of this single achievement. But the poet supplied an imperishable portraiture of their youth and of their national spirit, to the imagination of the Greek people; and the picture of this beautiful human heroism hovered as a directing ideal before their whole development and culture. So likewise, in the *Middle Ages,* we see the whole of Christendom united to attain one object – the conquest of the Holy Sepulchre; but, in spite of all the victories achieved, with just as little permanent result. The Crusades are the Trojan War of newly awakened Christendom, waged against the simple, homogeneous clearness of Mahometanism.

The royal houses perished, partly as the consequence of particular atrocities, partly through gradual extinction. There was no strictly moral bond connecting them with the tribes which they governed. The same relative position is occupied by the people and the royal houses in the Greek Tragedy also. The people is the Chorus – passive, deedless: the heroes perform the deeds, and incur the consequent responsibility. There is nothing in common between them; the people have no directing power, but only appeal to the gods. Such heroic personalities as those of the princes in question, are so remarkably suited for subjects of dramatic art on this very account – that they form their resolutions independently and individually, and are not guided by universal laws binding on every citizen; their conduct and their ruin are individual. The people appears separated from the royal houses, and these are regarded as an alien body – a higher race, fighting out the battles and undergoing the penalties of their fate, for themselves alone. Royalty having performed that which it had to perform, thereby rendered itself superfluous. The several dynasties are the agents of their own destruction, or perish not as the result of animosity, or of struggles on the side of the people: rather the families of the sovereigns are left in calm enjoyment of their power – a proof that the democratic government which

followed is not regarded as something absolutely diverse. How sharply do the annals of other times contrast with this!

This fall of the royal houses occurs after the Trojan war, and many changes now present themselves. The Peloponnesus was conquered by the Heraclidae, who introduced a calmer state of things, which was not again interrupted by the incessant migrations of races. The history now becomes more obscure; and though the several occurrences of the Trojan war are very circumstantially described to us, we are uncertain respecting the important transactions of the time immediately following, for a space of many centuries. No united undertaking distinguishes them, unless we regard as such that of which Thucydides speaks, viz., the war between the Chalcidians and Eretrians in Euboea, in which many nations took part. The towns vegetate in isolation, or at most distinguish themselves by war with their neighbors. Yet, they enjoy prosperity in this isolated condition, by means of trade ; a kind of progress to which their being rent by many party-struggles offers no opposition. In the same way, we observe in the Middle Ages the towns of Italy – which, both internally and externally, were engaged in continual struggle – attaining so high a degree of prosperity. The flourishing state of the Greek towns at that time is proved, according to Thucydides, also by the colonies sent out in every direction. Thus, Athens colonized Ionia and several islands; and colonies from the Peloponnesus settled in Italy and Sicily. Colonies, on the other hand, became relatively mother states; *e.g.,* Miletus, which founded many cities on the Propontis and the Black Sea. This sending out of colonies – especially during the period between the Trojan war and Cyrus – presents us with a remarkable phenomenon. It can be thus explained. In the several towns the people had the governmental power in their hands, since they gave the final decision in political affairs. In consequence of the long repose enjoyed by them, the population and the development of the community advanced rapidly; and

the immediate result was the amassing of great riches, contemporaneously with which fact great want and poverty make their appearance. Industry, in our sense, did not exist; and the lands were soon occupied. Nevertheless a part of the poorer classes would not submit to the degradations of poverty, for everyone felt himself a free citizen. The only expedient, therefore, that remained, was colonization. In another country, those who suffered distress in their own, might seek a free soil, and gain a living as free citizens by its cultivation. Colonization thus became a means of maintaining some degree of equality among the citizens; but this means is only a palliative, and the original inequality, founded on the difference of property, immediately reappears. The old passions were rekindled with fresh violence, and riches were soon made use of for securing power: thus "Tyrants" gained ascendancy in the cities of Greece. Thucydides says, "When Greece increased in riches, Tyrants arose in the cities, and the Greeks devoted themselves more zealously to the sea." At the time of Cyrus, the History of Greece acquires its peculiar interest; we see the various states now displaying their particular character. This is the date, too, of the formation of the distinct Greek Spirit. Religion and political institutions are developed with it, and it is these important phases of national life which must now occupy our attention.

In tracing up the rudiments of *Greek culture,* we first recall attention to the fact that the physical condition of the country does not exhibit such a characteristic unity, such a uniform mass, as to exercise a powerful influence over the inhabitants. On the contrary, it is diversified, and produces no decided impression. Nor have we here the unwieldy unity of a family or national combination; but, in the presence of scenery and displays of elemental power broken up into fragmentary forms, men's attention is more largely directed to themselves, and to the extension of their immature capabilities. Thus we see the Greeks – divided and separated from each

other – thrown back upon their inner spirit and personal energy, yet at the same time most variously excited and cautiously circumspect. We behold them quite undetermined and irresolute in the presence of Nature, dependent on its contingencies, and listening anxiously to each signal from the external world; but, on the other hand, intelligently taking cognizance of and appropriating that outward existence, and showing boldness and independent vigor in contending with it. These are the simple elements of their culture and religion. In tracing up their mythological conceptions, we find natural objects forming the basis – not *en masse,* however; only in dissevered forms. The Diana of Ephesus (that is, Nature as the universal Mother), the Cybele and Astarte of Syria – such comprehensive conceptions remained Asiatic, and were not transmitted to Greece. For the Greeks only *watch* the objects of Nature, and form *surmises* respecting them ; inquiring, in the depth of their souls, for the hidden meaning. According to Aristotle's dictum, that Philosophy proceeds from Wonder, the Greek view of Nature also proceeds from wonder of this kind.

Not that in their experience, Spirit meets something extraordinary, which it compares with the common order of things; for the intelligent view of a regular course of Nature, and the reference of phenomena to that standard, do not yet present themselves; but the Greek Spirit was excited to wonder at the *Natural* in Nature. It does not maintain the position of stupid indifference to it as something existing, and there an end of it; but regards it as something in the first instance foreign, in which, however, it has a presentiment of confidence, and the belief that it bears something within it which is friendly to the human Spirit, and which it may be permitted to sustain a positive relation. This *Wonder,* and this *Presentiment,* are here the fundamental categories ; though the Hellenes did not content themselves with these moods of feelings, but projected the hidden meaning, which was the subject of the surmise, into a distinct conception as an object of

consciousness. The Natural holds its place in their minds only after undergoing some transformation by Spirit – not immediately. Man regards Nature only as an excitement to his faculties, and only the Spiritual which he has evolved from it can have any influence over him. Nor is this commencement of the Spiritual apprehension of Nature to be regarded as an explanation suggested by *us;* it meets us in a multitude of conceptions formed by the Greeks themselves. The position of curious surmise, of attentive eagerness to catch the meaning of Nature, is indicated to us in the comprehensive idea of *Pan.* To the Greeks Pan did not represent the *objective* Whole, but that indefinite neutral ground which involves the element of the *subjective;* he embodies that thrill which pervades us in the silence of the forests; he was, therefore, especially worshipped in sylvan Arcadia: (a "panic terror" is the common expression for a groundless fright). Pan, this thrill-exciting being, is also represented as playing on the flute; we have not the bare internal presentiment, for Pan makes himself audible on the seven-reeded pipe. In what has been stated we have, on the one hand, the Indefinite, which, however, holds communication with man; on the other hand the fact, that such communication is only a subjective imagining – an explanation furnished by the percipient himself. On the same principle the Greeks listened to the murmuring of the fountains, and asked what might be thereby signified; but the signification which they were led to attach to it was not the objective meaning of the fountain, but the subjective – that of the subject itself, which further exalts the Naiad to a Muse. The Naiads, or Fountains, are the external, objective origin of the Muses. Yet the immortal songs of the Muses are not that which is heard in the murmuring of the fountains; they are the productions of the thoughtfully listening Spirit – *creative* while *observant.* The interpretation and explanation of Nature and its transformations – the indication of their sense and import – is the act of the subjective Spirit; and to this the Greeks

attached the name manteia. The general idea which this embodies, is the form in which man realizes his relationship to Nature. Manteia has reference both to the matter of the exposition and to the expounder who divines the weighty import in question. Plato speaks of it in reference to dreams, and to that delirium into which men fall during sickness; an interpreter, mantis, is wanted to explain these dreams and this delirium. That Nature answered the questions which the Greek put to her, is in this converse sense true, that he obtained an answer to the questions of Nature from his own Spirit. The insight of the Seer becomes thereby purely poetical; Spirit supplies the signification which the natural image expresses. Everywhere the Greeks desired a clear presentation and interpretation of the Natural. Homer tells us, in the last book of the Odyssey, that while the Greeks were overwhelmed with sorrow for Achilles, a violent agitation came over the sea: the Greeks were on the point of dispersing in terror, when the experienced Nestor arose and interpreted the phenomenon to them. Thetis, he said, was coming, with her nymphs, to lament for the death of her son. When a pestilence broke out in the camp of the Greeks, the Priest Calchas explained that Apollo was incensed at their not having restored the daughter of his priest Chryses when a ransom had been offered. The Oracle was originally interpreted exactly in this way. The oldest Oracle was at Dodona (in the district of the modern Janina). Herodotus says that the first priestesses of the temple there, were from Egypt; yet this temple is stated to be an ancient Greek one. The rustling of the leaves of the sacred oaks was the form of prognostication there. Bowls of metal were also suspended in the grove. But the sounds of the bowls dashing against each other were quite indefinite, and had no objective sense; the sense – the signification – was imparted to the sounds only by the human beings who heard them. Thus also the Delphic priestesses, in a senseless, distracted state – in the intoxication of enthusiasm (mantia) – uttered unintelligible

sounds; and it was the manteis who gave to these utterances a definite meaning. In the cave of Trophonius the noise of subterranean waters was heard, and apparitions were seen: but these indefinite phenomena acquired a meaning only through the interpreting, comprehending Spirit. It must also be observed, that these excitements of Spirit are in the first instance external, natural impulses. Succeeding them are internal changes taking place in the human being himself – such as dreams, or the delirium of the Delphic priestess – which require to be made intelligible by the mantis. At the commencement of the Iliad, Achilles is excited against Agamemnon, and is on the point of drawing his sword; but on a sudden he checks the movement of his arm, and recollects himself in his wrath, reflecting on his relation to Agamemnon. The Poet explains this by saying that it was Pallas-Athene (Wisdom or Consideration) that restrained him. When Ulysses among the Phaeacians has thrown his discus farther than the rest, and one of the Phaeacians shows a friendly disposition towards him, the Poet recognizes in him Pallas-Athene. Such an explanation denotes the perception of the inner meaning, the sense, the underlying truth; and the poets were in this way the teachers of the Greeks – especially Homer. Manteia in fact is Poesy – not a capricious indulgence of fancy, but an imagination which introduces the Spiritual into the Natural – in short a richly intelligent perception. The Greek Spirit, on the whole, therefore, is free from superstition, since it changes the *sensuous* into the *sensible* – the Intellectual – so that [oracular] decisions are derived from Spirit; although superstition comes in again from another quarter, as will be observed when impulsions from another source than the Spiritual, are allowed to tell upon opinion and action.

But the stimuli that operated on the Spirit of the Greeks are not to be limited to these objective and subjective excitements. The traditional element derived from foreign countries, the culture, the divinities and ritual

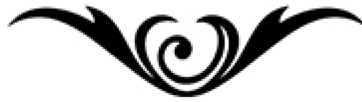
observances transmitted to them *ab extra* must also be included. It has been long a much vexed question whether the arts and the religion of the Greeks were developed independently or through foreign suggestion. Under the conduct of a one-sided understanding the controversy is interminable; for it is no less a fact of history that the Greeks derived conceptions from India, Syria, and Egypt, than that the Greek conceptions are peculiar to themselves, and those others alien. Herodotus (II. 53) asserts, with equal decision, that "*Homer and Hesiod invented a Theogony for the Greeks,* and assigned to the gods their appropriate epithets" (a most weighty sentence, which has been the subject of deep investigation, especially by Creuzer) – and, in another place, that Greece took the names of its divinities from Egypt, and that the Greeks made inquiry at Dodona, whether they ought to adopt these names or not. This appears selfcontradictory: it is, however, quite consistent; for the fact is that the Greeks evolved the Spiritual from the materials which they had received. The Natural, as *explained* by man – *i.e.,* its internal essential element – is, as a universal principle, the beginning of the Divine. Just as in Art the Greeks may have acquired a mastery of technical matters from others – from the Egyptians especially – so in their religion the commencement might have been from without; but by their independent spirit they transformed the one as well as the other.

Traces of such foreign rudiments may be generally discovered (Creuzer, in his "Symbolik," dwells especially on this point). The amours of Zeus appear indeed as something isolated, extraneous, adventitious, but it may be shown that foreign theogonic representations form their basis. Hercules is, among the Hellenes, that Spiritual Humanity which by native energy attains Olympus through the twelve far-famed labors: but the foreign idea that lies at the basis is the Sun, completing its revolution through the twelve signs of the Zodiac. The Mysteries were only such ancient rudiments, and certainly contained no greater wisdom than already existed in the consciousness of

the Greeks. All Athenians were initiated in the mysteries – Socrates excepted, who refused initiation, because he knew well that science and art are not the product of mysteries, and that Wisdom never lies among arcana. True science has its place much rather in the open field of consciousness.

In summing up the constituents of the *Greek Spirit,* we find its fundamental characteristic to be, that the freedom of Spirit is conditioned by and has an essential relation to some stimulus supplied by Nature. Greek freedom of thought is excited by an alien existence; but it is free because it transforms and virtually reproduces the stimulus by its own operation. This phase of Spirit is the medium between the loss of individuality on the part of man (such as we observe in the Asiatic principle, in which the Spiritual and Divine exists only under a Natural form), and Infinite Subjectivity as pure certainty of itself – the position that the Ego is the ground of all that can lay claim to substantial existence. The Greek Spirit as the medium between these two, begins with Nature, but transforms it into a mere objective form of its (Spirit's) own existence; Spirituality is therefore not yet absolutely free; not yet absolutely *self*-produced – is not self-stimulation. Setting out from surmise and wonder, the Greek Spirit advances to definite conceptions of the hidden meanings of Nature. In the subject itself too, the same harmony is produced. In Man, the side of his subjective existence which he owes to Nature, is the Heart, the Disposition, Passion, and Variety of Temperament: this side is then developed in a spiritual direction to free Individuality; so that the character is not placed in a relation to universally valid moral authorities, assuming the form of duties, but the Moral appears as a nature peculiar to the individual – an exertion of will, the result of disposition and individual constitution. This stamps the Greek character as that of *Individuality conditioned by Beauty,* which is produced by Spirit, transforming the merely Natural into an expression of its own being. The activity of Spirit does not yet possess in

itself the material and organ of expression, but needs the excitement of Nature and the matter which Nature supplies: it is not free, self-determining Spirituality, but mere naturalness formed to Spirituality – Spiritual Individuality. The Greek Spirit is the plastic artist, forming the stone into a work of art. In this formative process the stone does not remain mere stone – the form being only superinduced from without; but it is made an expression of the Spiritual, even contrary to its nature, and thus *trans*formed. Conversely, the artist *needs* for his spiritual conceptions, stone, colors, sensuous forms to express his idea. Without such an element he can no more be conscious of the idea himself, than give it an objective form for the contemplation of others; since it cannot in Thought alone become an object to him. The Egyptian Spirit also was a similar laborer in Matter, but the Natural had not yet been subjected to the Spiritual. No advance was made beyond a struggle and contest with it; the Natural still took an independent position, and formed one side of the image, as in the body of the Sphinx. In Greek Beauty the Sensuous is only a sign, an expression, an envelope, in which Spirit manifests itself.



It must be added, that while the Greek Spirit is a transforming artist of this kind, it knows itself free in its productions; for it is their creator, and they are what is called the "work of man." They are, however, not merely this, but Eternal Truth – the energizing of Spirit in its innate essence, and quite as really not created as created by man. He has a respect and veneration for these conceptions and images – this Olympian Zeus – this Pallas of the Acropolis – and in the same way for the laws, political and ethical, that guide his actions. But He, the human being, is the womb that conceived them, he the breast that suckled them, he the Spiritual to which their grandeur and purity are owing. Thus he feels himself calm in contemplating them, and not only free in himself, but possessing the consciousness of his freedom; thus the honor of the Human is swallowed up

in the worship of the Divine. Men honor the Divine in and for itself, but at the same time as their deed, their production, their phenomenal existence; thus the Divine receives its honor through the respect paid to the Human, and the Human in virtue of the honor paid to the Divine.

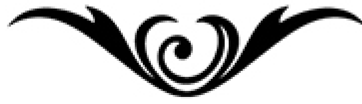
Such are the qualities of that *Beautiful Individuality,* which constitutes the centre of the Greek character. We must now consider the several radiations which this idea throws out in realizing itself. All issue in works of art, and we may arrange under three heads: the *subjective* work of art, that is, the culture of the man himself; – the *objective* work of art, *i.e.,* the shaping of the world of divinities; – lastly, the *political* work of art – the form of the Constitution, and the relations of the Individuals who compose it.

SECTION II: PHASES OF INDIVIDUALITY ÆSTHETICALLY CONDITIONED

CHAPTER I. THE SUBJECTIVE WORK OF ART

MAN WITH HIS necessities sustains a practical relation to external Nature, and in making it satisfy his desires, and thus using it up, has recourse to a system of *means.* For natural objects are powerful, and offer resistance in various ways. In order to subdue them, man introduces other natural agents; thus turns Nature against itself, and invents *instruments* for this purpose. These human inventions belong to Spirit, and such an instrument is to be respected more than a mere natural object. We see, too, that the Greeks are accustomed to set an especial value upon them, for in Homer, man's delight in them appears in a very striking way. In the notice of Agamemnon's sceptre, its origin is given in detail: mention is made of doors which turn on hinges, and of accoutrements and furniture, in a way that expresses satisfaction. The honor of human invention in subjugating Nature is ascribed to the gods. But, on the other hand, man uses Nature for *ornament,* which is intended only as a token of wealth and of that which man has made of himself. We find Ornament, in this interest, already very much developed among the Homeric Greeks. It is true that both barbarians and civilized nations ornament themselves ; but barbarians content themselves with mere ornament; they intend their persons to please by an *external* addition. But ornament by its very nature is destined only to beautify something other than itself, viz. the human body, which is man's immediate environment, and which, in common with Nature at large, he has to transform. The spiritual interest of Primary importance is, therefore, the development of the body to a perfect organ for the Will – an adaptation which may on the one hand itself be the means for ulterior objects, and on the other hand, appear as an object *per se.* Among the Greeks, then, we find this boundless impulse

of individuals to *display themselves,* and to find their enjoyment in so doing. Sensuous enjoyment does not become the basis of their condition when a state of repose has been obtained, any more than the dependence and stupor of superstition which enjoyment entails. They are too powerfully excited, too much bent upon developing their individuality, absolutely to adore Nature, as it manifests itself in its aspects of power and beneficence. That peaceful condition which ensued when a predatory life had been relinquished, and liberal nature had afforded security and leisure, turned their energies in the direction of self-assertion – the effort to dignify themselves. But while on the one side they have too much independent personality to be subjugated by superstition, that sentiment has not gone to the extent of making them *vain;* on the contrary, essential conditions must be first satisfied, before this can become a matter of vanity with them. The exhilarating sense of personality, in contrast with sensuous subjection to nature, and the need, not of mere pleasure, but of the display of individual powers, in order thereby to gain special distinction and consequent enjoyment, constitute therefore the chief characteristic and principal occupation of the Greeks. Free as the bird singing in the sky, the individual only expresses what lies in his untrammelled human nature – [to give the world "assurance of a man"] – to have his importance recognized. This is the *subjective* beginning of Greek Art – in which the human being elaborates his physical being, in free, beautiful movement and agile vigor, to a work of art. The Greeks first trained their own persons to beautiful configurations before they attempted the expression of such in marble and in paintings. The innocuous contests of *games,* in which every one exhibits his powers, is of very ancient date. Homer gives a noble description of the games conducted by Achilles, in honor of Patroclus; but in all his poems there is no notice of statues of the gods, though he mentions the sanctuary at Dodona, and the treasure-house of Apollo at Delphi. The games in Homer



consist in wrestling and boxing, running, horse and chariot races, throwing the discus or javelin, and archery. With these exercises are united dance and song, to express and form part of the enjoyment of social exhilaration, and which arts likewise blossomed into beauty. On the shield of Achilles, Hephaestus represents, among other things, how beautiful youths and maidens move as quickly "with well-taught feet," as the potter turns his wheel. The multitude stand round enjoying the spectacle; the divine singer accompanies the song with the harp, and two chief dancers perform their evolutions in the centre of the circle.

These games and aesthetic displays, with the pleasures and honors that accompanied them, were at the outset only private, originating in particular occasions; but in the sequel they became an affair of the nation, and were fixed for certain times at appointed places. Besides the Olympic games in the sacred district of Elis, there were also held the Isthmian, the Pythian, and Nemean, at other places.

If we look at the inner nature of these sports, we shall first observe how Sport itself is opposed to serious business, to dependence and need. This wrestling, running, contending was no serious affair; bespoke no obligation of defence, no necessity of combat. Serious occupation is labor that has reference to some want. I or Nature must succumb; if the one is to continue, the other must fall. In contrast with this kind of seriousness, however, Sport presents the higher seriousness; for in it Nature is wrought into Spirit, and although in these contests the subject has not advanced to the highest grade of serious thought, yet in this exercise of his physical powers, man shows his Freedom, viz. that he has transformed his body to an organ of Spirit. Man has immediately in one of his organs, the Voice, an element which admits and requires a more extensive purport than the mere sensuous Present. We have seen how *Song* is united with the Dance, and ministers to it: but, subsequently Song makes itself independent, and requires musical

instruments to accompany it; it then ceases to be unmeaning, like the modulations of a bird, which may indeed express emotion, but which have no objective import; but it requires an import created by imagination and Spirit, and which is then further formed into an *objective work of art.*

CHAPTER II. THE OBJECTIVE WORK OF ART

IF THE SUBJECT of Song as thus developed among the Greeks is made a question, we should say that its essential and absolute purport is *religious.* We have examined the Idea embodied in the Greek Spirit; and Religion is nothing else than this Idea made objective as the essence of being. According to that Idea, we shall observe also that the Divine involves the *vis natura* only as an element suffering a process of transformation to spiritual power. Of this Natural Element, as its origin, nothing more remains than the accord of analogy involved in the representation they formed of Spiritual power; for the Greeks worshipped God as Spiritual. We cannot, therefore, regard the Greek divinity as similar to the Indian – some Power of Nature for which the human shape supplies only an outward form. The essence is the Spiritual itself, and the Natural is only the point of departure. But on the other hand, it must be observed, that the divinity of the Greeks is not yet the *absolute,* free Spirit, but Spirit in a particular mode, fettered by the limitations of humanity – still dependent as a determinate individuality on external conditions. Individualities, objectively beautiful, are the gods of the Greeks. The divine Spirit is here so conditioned as to be not yet regarded as abstract Spirit, but has a *specialized existence* – continues to manifest itself in sense; but so that the sensuous is not its *substance,* but is only an *element* of its manifestation. This must be our leading idea in the consideration of the Greek mythology, and we must have our attention fixed upon it so much the more firmly, as – partly through the influence of erudition, which has whelmed essential principles beneath an infinite amount of details, and partly through that destructive analysis which is the work of the abstract Understanding – this mythology, together with the

more ancient periods of Greek history, has become a region of the greatest intellectual confusion.

In the Idea of the Greek Spirit we found the two elements, Nature and Spirit, in such a relation to each other, that Nature forms merely the point of departure. This degradation of Nature is in the Greek mythology the turning point of the whole – expressed as the War of the Gods, the overthrow of the Titans by the race of Zeus. The transition from the Oriental to the Occidental Spirit is therein represented, for the Titans are the merely Physical – natural existences, from whose grasp sovereignty is wrested. It is true that they continue to be venerated, but not as governing powers; for they are relegated to the verge [the limbus] of the world. The Titans are powers of Nature, Uranus, Gaea, Oceanus, Selene, Helios, etc. Chronos expresses the dominion of abstract Time, which devours its children. The unlimited power of reproduction is restrained, and Zeus appears as the head of the new divinities, who embody a spiritual import, and are themselves Spirit. It is not possible to express this transition more distinctly and naively than in this myth; the new dynasty of divinities proclaim their peculiar nature to be of a Spiritual order.

The second point is, that the new divinities retain natural elements, and consequently in themselves a determinate relation to the powers of Nature, as was previously shown. Zeus has his lightnings and clouds, and Hera is the creatress of the *Natural,* the producer of crescent vitality. Zeus is also the political god, the protector of morals and of hospitality. Oceanus, as such, is only the element of Nature which his name denotes. Poseidon has still the wildness of that element in his character; but he is also an ethical personage; to him is ascribed the building of walls and the production of the Horse. Helios is the sun as a natural element. This Light, according to the analogy of Spirit, has been transformed to self-consciousness, and Apollo has proceeded from Helios. The name lukeios points to the connection with

light; Apollo was a herdsman in the employ of Admetus, but oxen not subjected to the yoke were sacred to Helios: his rays, represented as arrows, kill the Python. The idea of Light as the natural power constituting the basis of the representation, cannot be dissociated from this divinity; especially as the other predicates attached to it are easily united with it, and the explanations of Müller and others, who deny that basis, are much more arbitrary and far-fetched. For Apollo is the prophesying and discerning god – Light, that makes everything clear. He is, moreover, the healer and strengthener; as also the destroyer, for he kills men. He is the propitiating and purifying god, *e.g.,* in contravention of the Eumenides – the ancient subterrene divinities – who exact hard, stern justice. He himself is pure; he has no wife, but only a sister, and is not involved in various disgusting adventures, like Zeus; moreover, he is the discerner and declarer, the singer and leader of the dances – as the sun leads the harmonious dance of stars. – In like manner the Naiads became the Muses. The mother of the gods, Cybele – continuing to be worshipped at Ephesus as Artemis – is scarcely to be recognized as the Artemis of the Greeks – the chaste huntress and destroyer of wild beasts. Should it be said that this change of the Natural into the Spiritual is owing to our allegorizing, or that of the later Greeks, we may reply, that this transformation of the Natural to the Spiritual is the Greek Spirit itself. The epigrams of the Greeks exhibit such advances from the Sensuous to the Spiritual. But the abstract Understanding cannot comprehend this blending of the Natural with the Spiritual.

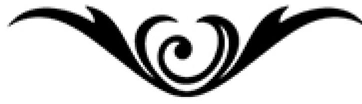
It must be further observed, that the Greek gods are to be regarded as individualities – not abstractions, like "Knowledge," "Unity," "Time," "Heaven," "Necessity." Such abstractions do not form the substance of these divinities; they are no allegories, no abstract beings, to which various attributes are attached, like the Horatian "*Necessitas clavis trabalibus*." As little are the divinities symbols, for a symbol is only a sign, an adumbration

of something else. The Greek gods express of themselves what they are. The eternal repose and clear intelligence that dignifies the head of Apollo, is not a symbol, but the expression in which Spirit manifests itself, and shows itself present. The gods are personalities, concrete individualities: an allegorical being has no qualities, but is itself one quality and no more. The gods are, moreover, special characters, since in each of them one peculiarity predominates as the characteristic one; but it would be vain to try to bring this circle of characters into a system. Zeus, perhaps, may be regarded as ruling the other gods, but not with substantial power; so that they are left free to their own idiosyncrasy. Since the whole range of spiritual and moral qualities was appropriated by the gods, the unity, which stood above them all, necessarily remained abstract ; it was therefore formless and unmeaning Fact, [the absolute constitution of things] – Necessity, whose oppressive character arises from the absence of the Spiritual in it; whereas the gods hold a friendly relation to men, for they are Spiritual natures. That higher thought, the knowledge of Unity as God – the One Spirit – lay beyond that grade of thought which the Greeks had attained.

With regard to the *adventitious* and special that attaches to the Greek gods, the question arises, where the external origin of this adventitious element is to be looked for. It arises partly from local characteristics – the scattered condition of the Greeks at the commencement of their national life, fixing as this did on certain points, and consequently introducing local representations. The local divinities stand alone, and occupy a much greater extent than they do afterwards, when they enter into the circle of the divinities, and are reduced to a limited position; they are conditioned by the particular consciousness and circumstances of the countries in which they appear. There are a multitude of Herculeses and Zeuses, that have their local history like the Indian gods, who also at different places possess temples to which a peculiar legend attaches. A similar relation occurs in the case of the

Catholic saints and their legends; though here, not the several localities, but the one "Mater Dei" supplies the point of departure, being afterwards localized in the most diversified modes. The Greeks relate the liveliest and most attractive stories of their gods – to which no limit can be assigned, since rich fancies were always gushing forth anew in the living Spirit of the Greeks. A second source from which adventitious specialities in the conception of the gods arose is that Worship of Nature, whose representations retain a place in the Greek myths, as certainly as they appear there also in a regenerated and transfigured condition. The preservation of the original myths, brings us to the famous chapter of the "*Mysteries.*" already mentioned. These mysteries of the Greeks present something which, as unknown, has attracted the curiosity of all times, under the supposition of profound wisdom. It must first be remarked that their antique and primary character, in virtue of its very antiquity, shows their destitution of excellence – their inferiority; – that the more refined truths are not expressed in these mysteries, and that the view which many have entertained is incorrect, viz. – that the Unity of God, in opposition to polytheism, was taught in them. The mysteries were rather antique rituals; and it is as unhistorical as it is foolish, to assume that profound philosophical truths are to be found here; since, on the contrary, only natural ideas – ruder conceptions of the metamorphoses occurring everywhere in nature, and of the vital principle that pervades it – were the subjects of those mysteries. If we put together all the historical data pertinent to the question, the result we shall inevitably arrive at will be that the mysteries did not constitute a system of doctrines, but were sensuous ceremonies and exhibitions, consisting of symbols of the universal operations of Nature, as, *e.g.,* the relation of the earth to celestial phenomena. The chief basis of the representations of Ceres and Proserpine, Bacchus and his train, was the universal principle of Nature; and the accompanying details were obscure

stories and representations, mainly bearing on the universal vital force and its metamorphoses. An analogous process to that of Nature, Spirit has also to undergo; for it must be twice-born, *i.e.* abnegate itself; and thus the representations given in the mysteries called attention, though only feebly, to the nature of Spirit. In the Greeks they produced an emotion of shuddering awe; for an instinctive dread comes over men, when a signification is perceived in a form, which as a sensuous phenomenon does not express that signification, and which therefore both repels and attracts – awakes surmises by the import that reverberates through the whole, but at the same time a thrill of dread at the repellent form. Æschylus was accused of having profaned the mysteries in his tragedies. The indefinite representations and symbols of the Mysteries, in which the profound import is only surmised, are an element alien to the clear pure forms, and threaten them with destruction ; on which account the gods of Art remain separated from the gods of the Mysteries, and the two spheres must be strictly dissociated. Most of their gods the Greeks received from foreign lands – as Herodotus states expressly with regard to Egypt – but these exotic myths were transformed and spiritualized by the Greeks; and that part of the foreign theogonies which accompanied them, was, in the mouth of the Hellenes, worked up into a legendary narrative which often redounded to the disadvantage of the divinities. Thus also the brutes which continued to rank as gods among the Egyptians, were degraded to external signs, accompanying the Spiritual god. While they have each an individual character, the Greek gods are also represented as human, and this anthropomorphism is charged as a defect. On the contrary (we may immediately rejoin) man as the Spiritual constitutes the element of truth in the Greek gods, which rendered them superior to all elemental deities, and all mere abstractions of the One and Highest Being. On the other side it is



alleged as an advantage of the Greek gods that they are represented as men – that being regarded as not the case with the Christian God. Schiller says:

“While the gods remained more human,
The men were more divine.”

But the Greek gods must not be regarded as more human than the Christian God. Christ is much more a *Man:* he lives, dies – suffers death on the cross – which is infinitely more human than the humanity of the Greek Idea of the Beautiful. But in referring to this common element of the Greek and the Christian religions, it must be said of both, that if a manifestation of God is to be supposed at all, his natural form must be that of Spirit, which for sensuous conception is essentially the human; for no other form can lay claim to spirituality. God appears indeed in the sun, in the mountains, in the trees, in everything that has life; but a natural appearance of this kind, is not the form proper to Spirit: here God is cognizable only in the mind of the percipient. If God himself is to be manifested in a corresponding expression, that can only be the human form: for from this the Spiritual beams forth. But if it were asked: Does God *necessarily* manifest himself? the question must be answered in the affirmative; for there is no essential existence that does not manifest itself. The real defect of the Greek religion, as compared with the Christian, is, therefore, that in the former the *manifestation* constitutes the highest mode in which the Divine being is conceived to exist – the sum and substance of divinity; while in the Christian religion the manifestation is regarded only as a *temporary phase* of the Divine. Here the *manifested* God dies, and elevates himself to glory; only after death is Christ represented as sitting at the right hand of God. The Greek god, on the contrary, exists for his worshippers perennially *in the manifestation* – only in marble, in metal or wood, or as figured by the imagination. But why did God not appear to the Greeks in the flesh?

Because man was not duly estimated, did not obtain honor and dignity, till he had more fully elaborated and developed himself in the attainment of the Freedom implicit in the aesthetic manifestation in question; the form and shaping of the divinity therefore continued to be the product of individual views, [not a general, impersonal one]. One element in Spirit is, that it produces itself – makes itself what it is: and the other is, that it is originally free – that Freedom is its *nature* and its Idea. But the Greeks, since they had not attained an intellectual conception of themselves, did not yet realize Spirit in its Universality – had not the idea of man and the essential unity of the divine and human nature according to the Christian view. Only the self-reliant, truly subjective Spirit can bear to dispense with the phenomenal side, and can venture to assign the Divine Nature to Spirit alone. It then no longer needs to inweave the Natural into its idea of the Spiritual, in order to hold fast its conception of the Divine, and to have its unity with the Divine, externally visible; but while free Thought *thinks* the Phenomenal, it is content to leave it as it is; for it also *thinks* that union of the Finite and the Infinite, and recognizes it not as a mere accidental union, but as the Absolute – the eternal Idea itself. Since Subjectivity was not comprehended in all its depth by the Greek Spirit, the true reconciliation was not attained in it, and the human Spirit did not yet assert its true position. This defect showed itself in the fact of Fate as pure subjectivity appearing superior to the gods; it also shows itself in the fact, that men derive their resolves not yet from themselves, but from their Oracles. Neither human nor divine subjectivity, recognized as infinite, has as yet, absolutely decisive authority.

CHAPTER III. THE POLITICAL WORK OF ART

THE STATE UNITES the two phases just considered, viz., the Subjective and the Objective Work of Art. In the State, Spirit is not a mere Object, like the deities, nor, on the other hand, is it merely subjectively developed to a beautiful physique. It is here a living, universal Spirit, but which is at the same time the self-conscious Spirit of the individuals composing the community. The *Democratical* Constitution alone was adapted to the Spirit and political condition in question. In the East we recognized Despotism, developed in magnificent proportions, as a form of government strictly appropriate to the Dawn-Land of History. Not less adapted is the democratical form in Greece, to the part assigned to it in the same great drama. In Greece, viz., we have the freedom of the Individual, but it has not yet advanced to such a degree of abstraction, that the subjective unit is conscious of direct dependence on the [general] substantial principle – the State as such. In this grade of Freedom, the individual will is unfettered in the entire range of its vitality, and embodies that substantial principle [the bond of the political union], according to its particular idiosyncrasy. In Rome, on the other hand, we shall observe a harsh sovereignty dominating over the individual members of the State; as also in the German Empire, a monarchy, in which the Individual is connected with and has *devoirs* to perform not only in regard to the monarch, but to the whole monarchical organization.

The Democratical State is not Patriarchal – does not rest on a still unreflecting, undeveloped confidence – but implies laws, with the consciousness of their being founded on an equitable and moral basis, and the recognition of these laws as positive. At the time of the Kings, no

political life had as yet made its appearance in Hellas; there are, therefore, only slight traces of Legislation. But in the interval from the Trojan War till near the time of Cyrus, its necessity was felt. The first Lawgivers are known under the name of The Seven Sages – a title which at that time did not imply any such character as that of the Sophists – teachers of wisdom, designedly [and systematically] proclaiming the Right and True – but merely thinking men, whose thinking stopped short of Science, properly so called. They were *practical* politicians; the good counsels which two of them – Thales of Miletus and Bias of Priene – gave to the Ionian cities, have been already mentioned. Thus Solon was commissioned by the Athenians to give them laws, as those then in operation no longer sufficed. Solon gave the Athenians a constitution by which all obtained equal rights, yet not so as to render the Democracy a quite abstract one. The main point in Democracy is moral disposition. *Virtue* is the basis of Democracy, remarks Montesquieu; and this sentiment is as important as it is true in reference to the idea of Democracy commonly entertained. The Substance, [the Principle] of Justice, the common weal, the general interest, is the main consideration ; but it is so only as Custom, in the form of Objective Will, so that morality properly so called – subjective conviction and intention – has not yet manifested itself. Law exists, and is in point of substance, the Law of Freedom – rational [in its form and purport,] and valid *because it is Law, i.e.,* without ulterior sanction. As in Beauty the Natural element – its sensuous coefficient – remains, so also in this customary morality, laws assume the form of a necessity of Nature. The Greeks occupy the middle ground of *Beauty* and have not yet attained the higher standpoint of Truth. While Custom and Wont is the form in which the Right is willed and done, that form is a stable one, and has not yet admitted into it the foe of [unreflected] immediacy – reflection and subjectivity of Will. The interests of the community may, therefore, continue to be intrusted to the will and

resolve of the citizens – and this must be the basis of the Greek constitution; for no principle has as yet manifested itself, which can contravene such Choice conditioned by Custom, and hinder its realizing itself in action. The Democratic Constitution is here the only possible one: the citizens are still unconscious of particular interests, and therefore of a corrupting element: the Objective Will is in their case not disintegrated. Athene the goddess is Athens itself – *i.e.,* the real and concrete spirit of the citizens. The divinity ceases to inspire their life and conduct, only when the Will has retreated within itself – into the *adytum* of cognition and conscience – and has posited the infinite schism between the Subjective and the Objective. The above is the true position of the Democratic polity; its justification and absolute necessity rest on this still immanent Objective Morality. For the modern conceptions of Democracy this justification cannot be pleaded. These provide that the interests of the community, the affairs of State, shall be discussed and decided by the People; that the individual members of the community shall deliberate, urge their respective opinions, and give their votes; and this on the ground that the interests of the State and its concerns are the interests of such individual members. All this is very well; but the essential condition and distinction in regard to various phases of Democracy is: *What is the character of* these individual members? They are absolutely authorized to assume their position, only in as far as their will is still *Objective Will* – not one that wishes this or that, not mere "good" will. For good will is something particular – rests on the morality of individuals, on their conviction and subjective feeling. That very subjective Freedom which constitutes the principle and determines the peculiar form of Freedom in *our* world – which forms the absolute basis of our political and religious life, could not manifest itself in Greece otherwise than as a *destructive* element. Subjectivity was a grade not greatly in advance of that occupied by the Greek Spirit; that phase must of necessity soon be attained: but it

plunged the Greek world into ruin, for the polity which that world embodied was not calculated for this side of humanity – did not recognize this phase; since it had not made its appearance when that polity began to exist. Of the Greeks in the first and genuine form of their Freedom, we may assert, that they had no conscience; the habit of living for their country without further [analysis or] reflection, was the principle dominant among them. The consideration of the State in the abstract – which to our understanding is the essential point – was alien to them. Their grand object was their country in its living and real aspect; – *this actual* Athens, this Sparta, these Temples, these Altars, this form of social life, this union of fellow-citizens, these manners and customs. To the Greek his country was a necessary of life, without which existence was impossible. It was the Sophists – the "Teachers of Wisdom" – who first introduced subjective reflection, and the new doctrine that each man should act according to his own conviction. When reflection once comes into play, the inquiry is started whether the Principles of Law (*das Recht*) cannot be improved. Instead of holding by the existing state of things, *internal* conviction is relied upon; and thus begins a subjective independent Freedom, in which the individual finds himself in a position to bring everything to the test of his own conscience, even in defiance of the existing constitution. Each one has his "principles," and that view which accords with his private judgment he regards as *practically* the best, and as claiming practical realization. This decay even Thucydides notices, when he speaks of every one's thinking that things are going on badly when he has not a hand in the management.

To this state of things – in which every one presumes to have a judgment of his own – confidence in Great Men is antagonistic. When, in earlier times, the Athenians commission Solon to legislate for them, or when Lycurgus appears at Sparta as lawgiver and regulator of the State, it is evidently not supposed that the people in general think that they know best

what is politically right. At a later time also, it was distinguished personages of plastic genius in whom the people placed their confidence : Cleisthenes, *e.g.,* who made the constitution still more democratic than it had been – Miltiades, Themistocles, Aristides, and Cimon, who in the Median wars stand at the head of Athenian affairs – and Pericles, in whom Athenian glory centres as in its focus. But as soon as any of these great men had performed what was needed, envy intruded – *i.e.* the recoil of the sentiment of equality against conspicuous talent – and he was either imprisoned or exiled. Finally, the Sycophants arose among the people, aspersing all individual greatness, and reviling those who took the lead in public affairs.

But there are three other points in the condition of the Greek republics that must be particularly observed.

1. With Democracy in that form in which alone it existed in Greece, *Oracles* are intimately connected. To an independent resolve, a consolidated Subjectivity of the Will (in which the latter is determined by preponderating reasons) is absolutely indispensable; but the Greeks had not this element of strength and vigor in their volition. When a colony was to be founded, when it was proposed to adopt the worship of foreign deities, or when a general was about to give battle to the enemy, the oracles were consulted. Before the battle of Plataea, Pausanias took care that an augury should be taken from the animals offered in sacrifice, and was informed by the soothsayer Tisam-enus that the sacrifices were favorable to the Greeks provided they remained on the hither side of the Asopus, but the contrary, if they crossed the stream and began the battle. Pausanias, therefore, awaited the attack. In their private affairs, too, the Greeks came to a determination not so much from subjective conviction as from some extraneous suggestion. With the advance of democracy we observe the oracles no longer consulted on the most important matters, but the particular views of popular orators influencing and deciding the policy of the State. As at this time Socrates

relied upon his “Daemon,” so the popular leaders and the people relied on their individual convictions in forming their decisions. But contemporaneously with this were introduced corruption, disorder, and an unintermitted process of change in the constitution.

2. Another circumstance that demands special attention here, is the element of *Slavery.* This was a necessary condition of an aesthetic democracy, where it was the right and duty of every citizen to deliver or to listen to orations respecting the management of the State in the place of public assembly, to take part in the exercise of the Gymnasia, and to join in the celebration of festivals. It was a necessary condition of such occupations, that the citizens should be freed from handicraft occupations; consequently, that what among us is performed by free citizens – the work of daily life – should be done by slaves. Slavery does not cease until the Will has been infinitely self-reflected – until Right is conceived as appertaining to every freeman, and the term freeman is regarded as a synonym for man in his generic nature as endowed with Reason. But here we still occupy the standpoint of Morality as mere Wont and Custom, and therefore known only as a peculiarity attaching to a certain kind of existence [not as absolute and universal Law].

3. It must also be remarked, thirdly, that such democratic constitutions are possible only in small states – states which do not much exceed the compass of cities. The whole Polis of the Athenians is united in the one city of Athens. Tradition tells that Theseus united the scattered Demes into an integral totality. In the time of Pericles, at the beginning of the Peloponnesian War, when the Spartans were marching upon Attica, its entire population took refuge in the city. Only in such cities can the interests of all be similar; in large empires, on the contrary, diverse and conflicting interests are sure to present themselves. The living together in one city, the fact that the inhabitants see each other daily, render a common culture and a

living democratic polity possible. In Democracy, the main point is that the character of the citizen be plastic, all "of a piece." He must be present at the critical stages of public business ; he must take part in decisive crises with his entire personality – not with his vote merely; he must mingle in the heat of action – the passion and interest of the whole man being absorbed in the affair, and the warmth with which a resolve was made being equally ardent during its execution. That unity of opinion to which the whole community must be brought [when any political step is to be taken,] must be produced in the individual members of the state by *oratorical suasion.* If this were attempted by *writing* – in an abstract, lifeless way – no general fervor would be excited among the social units; and the greater the number, the less weight would each individual vote have. In a large empire a general inquiry might be made, votes might be gathered in the several communities, and the results reckoned up – as was done by the French Convention. But a political existence of this kind is destitute of life, and the World is *ipso facto* broken into fragments and dissipated into a mere Paper-world. In the French Revolution, therefore, the republican constitution never actually became a Democracy: Tyranny, Despotism, raised its voice under the mask of Freedom and Equality.

We come now to the Second Period of Greek History. The first period saw the Greek Spirit attain its aesthetic development and reach maturity – realize its *essential being.* The second shows it manifesting itself – exhibits it in its full glory as producing a work for the world, asserting its principle in the struggle with an antagonistic force, and triumphantly maintaining it against that attack.

THE WARS WITH THE PERSIANS

THE PERIOD OF contact with the preceding World-Historical people, is generally to be regarded as the *second* in the history of any nation. The World-Historical contact of the Greeks was with the Persians; in that, Greece exhibited itself in its most glorious aspect. The occasion of the Median wars was the revolt of the Ionian cities against the Persians, in which the Athenians and Eretrians assisted them. That which, in particular, induced the Athenians to take their part, was the circumstance that the son of Pisistratus, after his attempts to regain sovereignty in Athens had failed in Greece, had betaken himself to the King of the Persians. The Father of History has given us a brilliant description of these Median wars, and for the object we are now pursuing we need not dwelling upon them.

At the beginning of the Median wars, Lacedaemon was in possession of the Hegemony, partly as the result of having subjugated and enslaved the free nation of the Messenians, partly because it had assisted many Greek states to expel their Tyrants. Provoked by the part the Greeks had taken in assisting the Ionians against him, the Persian King sent heralds to the Greek cities to require them to give Water and Earth, *i.e.* to acknowledge his supremacy. The Persian envoys were contemptuously sent back, and the Lacedaemonians went so far as to throw them into a well – a deed, however, of which they afterwards so deeply repented, as to send two Lacedaemonians to Susa in expiation. The Persian King then despatched an army to invade Greece. With its vastly superior force the Athenians and Plataeans, without aid from their compatriots, contended at Marathon under Miltiades, and gained the victory. Afterwards, Xerxes came down upon Greece with his enormous masses of nations (Herodotus gives a detailed

description of this expedition); and with the terrible array of land-forces was associated the not less formidable fleet. Thrace, Macedon, and Thessaly were soon subjugated; but the entrance into Greece Proper – the Pass of Thermopylae – was defended by three hundred Spartans and seven hundred Thespians, whose fate is well known. Athens, voluntarily deserted by its inhabitants, was ravaged; the images of the gods which it contained were “an abomination” to the Persians, who worshipped the Amorphous, the Unformed. In spite of the disunion of the Greeks, the Persian fleet was beaten at Salamis; and this glorious battle-day presents the three greatest tragedians of Greece in remarkable chronological association: for Æschylus was one of the combatants, and helped to gain the victory, Sophocles danced at the festival that celebrated it, and on the same day Euripides was born. The host that remained in Greece, under the command of Mardonius, was beaten at Plataea by Pausanias, and the Persian power was consequently broken at various points.

Thus was Greece freed from the pressure which threatened to overwhelm it. Greater battles, unquestionably, have been fought; but these live immortal not in the historical records of Nations only, but also of Science and of Art – of the Noble and the Moral generally. For these are World-Historical victories; they were the salvation of culture and Spiritual vigor, and they rendered the Asiatic principle powerless. How often, on other occasions, have not men sacrificed everything for one grand object! How often have not warriors fallen for Duty and Country! But here we are called to admire not only valor, genius and spirit, but the purport of the contest – the effect, the result, which are unique in their kind. In all other battles a particular interest is predominant; but the immortal fame of the Greeks is none other than their due, in consideration of the noble cause for which deliverance was achieved. In the history of the world it is not the formal [subjective and individual] valor that has been displayed, not the so-called

merit of the combatants, but the importance of the cause itself, that must decide the fame of the achievement. In the case before us, the interest of the World's History hung trembling in the balance. Oriental despotism – a world united under one lord and sovereign – on the one side, and separate states – insignificant in extent and resources, but animated by free individuality – on the other side, stood front to front in array of battle. Never in History has the superiority of spiritual power over material bulk – and that of no contemptible amount – been made so gloriously manifest. This war, and the subsequent development of the states which took the lead in it, is the most brilliant period of Greece. Everything which the Greek principle involved, then reached its perfect bloom and came into the light of day.

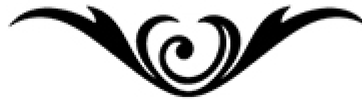
The Athenians continued their wars of conquest for a considerable time, and thereby attained a high degree of prosperity; while the Lacedaemonians, who had no naval power, remained quiet. The antagonism of Athens and Sparta now commences – a favorite theme for historical treatment. It may be asserted that it is an idle inquiry, which of these two states justly claims the superiority, and that the endeavor should rather be, to exhibit each as in its own department a necessary and worthy phase of the Greek Spirit. On Sparta's behalf, *e.g.,* many categories may be referred to in which she displays excellence; strictness in point of morals, subjection to discipline, etc., may be advantageously cited. But the leading principle that characterizes this state is Political Virtue, which Athens and Sparta have, indeed, in common, but which in the one state developed itself to a work of Art, viz., Free Individuality – in the other retained its substantial form. Before we speak of the Pelopon-nesian War, in which the jealousy of Sparta and Athens broke out into a flame, we must exhibit more specifically the fundamental character of the two states – their distinctions in a political and moral respect.

ATHENS

WE HAVE ALREADY become acquainted with Athens as an asylum for the inhabitants of the other districts of Greece, in which a very mixed population was congregated. The various branches of human industry – agriculture, handicraft, and trade (especially by sea) – were united in Athens, but gave occasion to much dissension. An antagonism had early arisen between ancient and wealthy families and such as were poorer. Three parties, whose distinction had been grounded on their local position and the mode of life which that position suggested were then fully recognized. These were, the Pediaeans – inhabitants of the plain, the rich and aristocratic; the Diacrians – mountaineers, cultivators of the vine and olive, and herdsmen, who were the most numerous class; and between the two [in political status and sentiment] the Paralians – inhabitants of the coast, the moderate party. The polity of the state was wavering between Aristocracy and Democracy. Solon effected, by his division into four property-classes, a medium between these opposites. All these together formed the popular assembly for deliberation and decision on public affairs; but the offices of government were reserved for the three superior classes. It is remarkable that even while Solon was still living and actually present, and in spite of his opposition, Pisistratus acquired supremacy. The constitution had, as it were, not yet entered into the blood and life of the community; it had not yet become the habit of moral and civil existence. But it is still more remarkable that Pisistratus introduced no legislative changes, and that he presented himself before the Areopagus to answer an accusation brought against him. The rule of Pisistratus and of his sons appears to have been needed for repressing the power of great families and factions – for

accustoming them to order and peace, and the citizens generally, on the other hand, to the Solonian legislation. This being accomplished, that rule was necessarily regarded as superfluous, and the principles of a free code enter into conflict with the power of the Pisistratidae. The Pisistratidae were expelled, Hipparchus killed, and Hippias banished. Then factions were revived; the Alcmaeonidas, who took the lead in the insurrection, favored Democracy; on the other hand, the Spartans aided the adverse party of Isagoras, which followed the aristocratic direction. The Alcmaeonidae, with Cleisthenes at their head, kept the upper hand. This leader made the constitution still more democratic than it had been; the pulai, of which hitherto there had been only four, were increased to ten, and this had the effect of diminishing the influence of the clans. Lastly, Pericles rendered the constitution yet more democratic by diminishing the essential dignity of the Areopagus, and bringing causes that had hitherto belonged to it, before the Demos and the [ordinary] tribunals.

Pericles was a statesman of plastic antique character: when he devoted himself to public life, he renounced private life, withdrew from all feasts and banquets, and pursued without intermission his aim of being useful to the state – a course of conduct by which he attained such an exalted position, that Aristophanes calls him the Zeus of Athens. We cannot but admire him in the highest degree: he stood at the head of a light-minded but highly refined and cultivated people; the only means by which he could obtain influence and authority over them, was his personal character and the impression he produced of his being a thoroughly noble man, exclusively intent upon the weal of the State, and of superiority to his fellow-citizens in native genius and acquired knowledge. In force of individual character no statesman can be compared with him.



As a general principle, the Democratic Constitution affords the widest scope for the development of great political characters ; for it excels all

others in virtue of the fact that it not only *allows of* the display of their powers on the part of individuals, but *summons* them to use those powers for the general weal. At the same time, no member of the community can obtain influence unless he has the power of satisfying the intellect and judgment, as well as the passions and volatility of a cultivated people. In Athens a vital freedom existed, and a vital equality of manners and mental culture; and if inequality of property could not be avoided, it nevertheless did not reach an extreme. Together with this equality, and within the compass of this freedom, all diversities of character and talent, and all variety of idiosyncrasy could assert themselves in the most unrestrained manner, and find the most abundant stimulus to development in its environment ; for the predominant elements of Athenian existence were the independence of the social units, and a culture animated by the Spirit of Beauty. It was Pericles who originated the production of those eternal monuments of sculpture whose scanty remains astonish posterity; it was before this people that the dramas of Æschylus and Sophocles were performed; and later on those of Euripides – which, however, do not exhibit the same plastic moral character, and in which the principle of corruption is more manifest. To this people were addressed the orations of Pericles: from it sprung a band of men whose genius has become classical for all centuries; for to this number belong," besides those already named, Thucydides, Socrates, Plato, and Aristophanes – the last of whom preserved entire the political seriousness of his people at the time when it was being corrupted; and who, imbued with this seriousness, wrote and dramatized with a view to his country's weal. We recognize in the Athenians great industry, susceptibility to excitement, and development of individuality within the sphere of Spirit conditioned by the morality of Custom. The blame with which we find them visited in Xenophon and Plato, attaches rather to that later period when misfortune and the corruption of the democracy had

already supervened. But if we would have the verdict of the Ancients on the political life of Athens, we must turn, not to Xenophon, nor even to Plato, but to those who had a thorough acquaintance with the state in its full vigor – who managed its affairs and have been esteemed its greatest leaders – *i.e.,* to its Statesmen. Among these, Pericles is the Zeus of the human Pantheon of Athens. Thucydides puts into his mouth the most profound description of Athenian life, on the occasion of the funeral obsequies of the warriors who fell in the second year of the Peloponnesian War. He proposes to show for what a city and in support of what interests they had died; and this leads the speaker directly to the essential elements of the Athenian community. He goes on to paint the character of Athens, and what he says is most profoundly thoughtful, as well as most just and true. "We love the beautiful," he says, "but without ostentation or extravagance; we philosophize without being seduced thereby into effeminacy and inactivity (for when men give themselves up to Thought, they get further and further from the Practical – from activity for the public, for the common weal). We are bold and daring; but this courageous energy in action does not prevent us from giving ourselves an account of what we undertake (we have a clear consciousness respecting it); among other nations, on the contrary, martial daring has its basis in deficiency of culture: we know best how to distinguish between the agreeable and the irksome; notwithstanding which, we do not shrink from perils."

Thus Athens exhibited the spectacle of a state whose existence was essentially directed to realizing the Beautiful, which had a thoroughly cultivated consciousness respecting the serious side of public affairs and the interests of Man's Spirit and Life, and united with that consciousness, hardy courage and practical ability.

SPARTA

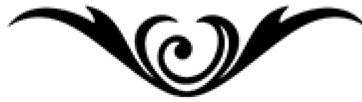
Here we witness on the other hand rigid abstract virtue – a life devoted to the State, but in which the activity and freedom of individuality are put in the background. The polity of Sparta is based on institutions which do full justice to the interest of the State, but whose object is a lifeless equality – not free movement. The very first steps in Spartan History are very different from the early stages of Athenian development. The Spartans were Dorians – the Athenians, Ionians; and this national distinction has an influence on their Constitution also. In reference to the mode in which the Spartan State originated, we observe that the Dorians invaded the Peloponnesus with the Heracleidas, subdued the indigenous tribes, and condemned them to slavery; for the Helots were doubtless aborigines. The fate that had befallen the Helots was suffered at a later epoch by the Messenians; for inhuman severity of this order was innate in Spartan character. While the Athenians had a family-life, and slaves among them were inmates of the house, the relation of the Spartans to the subjugated race was one of even greater harshness than that of the Turks to the Greeks; a state of warfare was constantly kept up in Lacedaemon. In entering upon office, the Ephors made an unreserved declaration of war against the Helots, and the latter were habitually given up to the younger Spartans to be practised upon in their martial exercises. The Helots were on some occasions set free, and fought against the enemy; moreover, they displayed extraordinary valor in the ranks of the Spartans; but on their return they were butchered in the most cowardly and insidious way. As in a slave-ship the crew are constantly armed, and the greatest care is taken to prevent an insurrection, so the

Spartans exercised a constant vigilance over the Helots, and were always in a condition of war, as against enemies.

Property in land was divided, even according to the constitution of Lycurgus (as Plutarch relates), into equal parts, of which 9,000 only belonged to the Spartans – *i.e.,* the inhabitants of the city – and 30,000 to the Lacedaemonians or Period. At the same time it was appointed, in order to maintain this equality, that the portions of ground should not be sold. But how little such an institution avails to effect its object, is proved by the fact, that in the sequel Lacedaemon owed its ruin chiefly to the inequality of possessions. As daughters were capable of inheriting, many estates had come by marriage into the possession of a few families, and at last all the landed property was in the hands of a limited number; as if to show how foolish it is to attempt a forced equality – an attempt which, while ineffective in realizing its professed object, is also destructive of a most essential point of liberty – the free disposition of property. Another remarkable feature in the legislation of Lycurgus, is his forbidding all money except that made of iron – an enactment which necessitated the abolition of all foreign business and traffic. The Spartans moreover had no naval force – a force indispensable to the support and furtherance of commerce; and on occasions when such a force was required, they had to apply to the Persians for it.

It was with an especial view to promote similarity of manners, and a more intimate acquaintance of the citizens with each other, that the Spartans had meals in common – a community, however, which disparaged family life; for eating and drinking is a private affair, and consequently belongs to domestic retirement. It was so regarded among the Athenians; with them association was not material but spiritual, and even their banquets, as we see from Xenophon and Plato, had an intellectual tone. Among the Spartans, on the other hand, the costs of the common meal were met by the

contributions of the several members, and he who was too poor to offer such a contribution was consequently excluded.



As to the Political Constitution of Sparta, its basis may be called democratic, but with considerable modifications which rendered it almost an Aristocracy and Oligarchy. At the head of the State were two Kings, at whose side was a Senate (gerousia), chosen from the best men of the State, and which also performed the functions of a court of justice – deciding rather in accordance with moral and legal customs, than with written laws. The gerousia also the highest State-Council – the Council of the Kings, regulating the most important affairs. Lastly, one of the highest magistracies was that of the *Ephors,* respecting whose election we have no definite information; Aristotle says that the mode of choice was exceedingly childish. We learn from Aristotle that even persons without nobility or property could attain this dignity. The Ephors had full authority to convoke popular assemblies, to put resolutions to the vote, and to propose laws, almost in the same way as the *tribuni plebis* in Rome. Their power became tyrannical, like that which Robespierre and his party exercised for a time in France.

While the Lacedaemonians directed their entire attention to the State, Intellectual Culture – Art and Science – was not domiciled among them. The Spartans appeared to the rest of the Greeks, stiff, coarse, awkward beings, who could not transact business involving any degree of intricacy, or at least performed it very clumsily. Thucydides makes the Athenians say to the Spartans: "You have laws and customs which have nothing in common with others; and besides this, you proceed, when you go into other countries, neither in accordance with these, nor with the traditionary usages of Hellas." In their intercourse at home, they were, on the whole, honorable; but as regarded their conduct towards other nations, they themselves plainly declared that they held their own good pleasure for the Commendable, and

what was advantageous for the Right. It is well known that in Sparta (as was also the case in Egypt) the taking away of the necessaries of life, under certain conditions, was permitted; only the thief must not allow himself to be discovered. Thus the two States, Athens and Sparta, stand in contrast with each other. The morality of the latter is rigidly directed to the maintenance of the State; in the former we find a similar ethical relation, but with a cultivated consciousness, and boundless activity in the production of the Beautiful – subsequently, of the True also. This Greek morality, though extremely beautiful, attractive and interesting in its manifestation, is not the highest point of view for Spiritual self-consciousness. It wants the form of Infinity, the reflection of thought within itself, the emancipation from the Natural element – (the Sensuous that lurks in the character of Beauty and Divinity [as comprehended by the Greeks]) – and from that immediacy, [that undeveloped simplicity,] which attaches to their ethics. Self- Comprehension on the part of Thought is wanting – illimitable Self-Consciousness – demanding, that what is regarded by me as Right and Morality should have its confirmation in myself – from the testimony of my own Spirit; that the Beautiful (the Idea as manifested in sensuous contemplation or conception) may also become the True – an inner, supersensuous world. The standpoint occupied by the Æsthetic Spiritual Unity which we have just described, could not long be the resting-place of Spirit; and the element in which further advance and corruption originated, was that of Subjectivity – inward morality, individual reflection, and an inner life generally. The perfect bloom of Greek life lasted only about sixty years – from the Median wars, B.C. 492, to the Peloponnesian War, B.C. 431. The principle of subjective morality which was inevitably introduced, became the germ of corruption, which, however, showed itself in a different form in Athens from that which it assumed in Sparta: in Athens, as levity in public conduct, in Sparta, as private depravation of

morals. In their fall, the Athenians showed themselves not only amiable, but great and noble – to such a degree that we cannot but lament it; among the Spartans, on the contrary, the principle of subjectivity develops itself in vulgar greed, and issues in vulgar ruin.

THE PELOPONNESIAN WAR

THE PRINCIPLE OF corruption displayed itself first in the external political development – in the contest of the states of Greece with each other, and the struggle of factions within the cities themselves. The Greek Morality had made Hellas unfit to form one common state; for the dissociation of small states from each other, and the concentration in cities, where the interest and the spiritual culture pervading the whole, could be identical, was the necessary condition of that grade of Freedom which the Greeks occupied. It was only a momentary combination that occurred in the Trojan War, and even in the Median wars a union could not be accomplished. Although the tendency towards such a union is discoverable, the bond was but weak, its permanence was always endangered by jealousy, and the contest for the Hegemony set the States at variance with each other. A general outbreak of hostilities in the Peloponnesian War was the consummation. Before it, and even at its commencement, Pericles was at the head of the Athenian nation – that people most jealous of its liberty; it was only his elevated personality and great genius that enabled him to maintain his position. After the wars with the Medes, Athens enjoyed the Hegemony; a number of allies – partly islands, partly towns – were obliged to contribute to the supplies required for continuing the war against the Persians; and instead of the contribution being made in the form of fleets or troops, the subsidy was paid in money. Thereby an immense power was concentrated in Athens; a part of the money was expended in great architectural works, in the enjoyment of which, since they were products of Spirit, the allies had some share. But that Pericles did not devote the whole of the money to works of Art, but also made provision for the Demos in other ways, was evident after his

death, from the quantity of stores amassed in several magazines, but especially in the naval arsenal. Xenophon says: “Who does not stand in need of Athens? Is she not indispensable to all lands that are rich in corn and herds, in oil and wine – to all who wish to traffic either in money or in mind? – to craftsmen, sophists, philosophers, poets, and all who desire what is worth seeing or hearing in sacred and public matters?”

In the Peloponnesian War, the struggle was essentially between Athens and Sparta. Thucydides has left us the history of the greater part of it, and his immortal work is the absolute gain which humanity has derived from that contest. Athens allowed herself to be hurried into the extravagant projects of Alcibiades; and when these had already much weakened her, she was compelled to succumb to the Spartans, who were guilty of the treachery of applying for aid to Persia, and who obtained from the King supplies of money and a naval force. They were also guilty of a still more extensive treason, in abolishing democracy in Athens and in the cities of Greece generally, and in giving a preponderance to factions that desired oligarchy, but were not strong enough to maintain themselves without foreign assistance. Lastly, in the peace of Antalcidas, Sparta put the finishing stroke to her treachery, by giving over the Greek cities in Asia Minor to Persian dominion.

Lacedaemon had therefore, both by the oligarchies which it had set up in various countries, and by the garrisons which it maintained in some cities – as, *e.g.,* Thebes – obtained *a* great preponderance in Greece. But the Greek states were far more incensed at Spartan oppression than they had previously been at Athenian supremacy. With Thebes at their head, they cast off the yoke, and the Thebans became for a moment the most distinguished people in Hellas. But it was to two distinguished men among its citizens that Thebes owed its entire power – Pelopidas and Epaminondas; as for the most part in that state we find the Subjective

preponderant. In accordance with this principle, Lyrical Poetry – that which is the expression of subjectivity – especially flourished there; a kind of subjective amenity of nature shows itself also in the so- called Sacred Legion which formed the kernel of the Theban host, and was regarded as consisting of persons connected by amatory bonds [*amantes* and *amati*]; while the influence of subjectivity among them was especially proved by the fact, that after the death of Epaminondas, Thebes fell back into its former position. Weakened and distracted, Greece could no longer find safety in itself, and needed an authoritative prop. In the towns there were incessant contests; the citizens were divided into factions, as in the Italian cities of the Middle Ages. The victory of one party entailed the banishment of the other; the latter then usually applied to the enemies of their native city, to obtain their aid in subjugating it by force of arms. The various States could no longer co-exist peaceably: they prepared ruin for each other, as well as for themselves.

We have, then, now to investigate the *corruption* of the Greek world in its profounder import, and may denote the principle of that corruption as *subjectivity obtaining emancipation for itself.* We see Subjectivity obtruding itself in various ways. Thought – the subjectively Universal – menaces the beautiful religion of Greece, while the passions of individuals and their caprice menace its political constitution. In short, Subjectivity, comprehending and manifesting itself, threatens the existing state of things in every department – characterized as that state of things is by Immediacy [a primitive, unreflecting simplicity]. Thought, therefore, appears here as the principle of decay – decay, viz. of Substantial [prescriptive] morality; for it introduces an antithesis, and asserts essentially rational principles. In the Oriental states, in which there is no such antithesis, moral freedom cannot be realized, since the highest principle is [Pure] Abstraction. But when Thought recognizes its positive character, as in Greece, it establishes

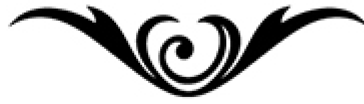
principles; and these bear to the real world the relation of Essence to Form. For the concrete vitality found among the Greeks, is Customary Morality – a life for Religion, for the State, without further reflection, and without analysis leading to abstract definitions, which must lead away from the concrete embodiment of them, and occupy an antithetical position to that embodiment. Law is part of the existing state of things, with Spirit *implicit* in it. But as soon as Thought arises, it investigates the various political constitutions: as the result of its investigation it forms for itself an idea of an improved state of society, and demands that this ideal should take the place of things as they are.

In the principle of Greek Freedom, inasmuch as it is Freedom, is involved the self-emancipation of Thought. We observed the dawn of Thought in the circle of men mentioned above under their well-known appellation of the Seven Sages. It was they who first uttered general propositions; though at that time wisdom consisted rather in a concrete insight [into things, than in the power of abstract conception]. Parallel with the advance in the development of Religious Art and with political growth, we find a progressive strengthening of Thought, its enemy and destroyer; and at the time of the Peloponnesian War science was already developed. With the Sophists began the process of reflection on the existing state of things, and of ratiocination. That very diligence and activity which we observed among the Greeks in their practical life, and in the achievement of works of art, showed itself also in the turns and windings which these ideas took ; so that, as material things are changed, worked up and used for other than their original purposes, similarly the essential being of Spirit – what is thought and known – is variously handled; it is made an object about which the mind can employ itself, and this occupation becomes an interest in and for itself. The movement of Thought – that which goes on within its sphere [without reference to an extrinsic object] – a process which had formerly no

interest – acquires attractiveness on its own account. The cultivated Sophists, who were not erudite or scientific men, but masters of subtle turns of thought, excited the admiration of the Greeks. For all questions they had an answer; for all interests of a political or religious order they had general points of view; and in the ultimate development of their art, they claimed the ability to prove everything, to discover a justifiable side in every position. In a democracy it is a matter of the first importance, to be able to speak in popular assemblies – to urge one's opinions on public matters. Now this demands the power of duly presenting before them that point of view which we desire them to regard as essential. For such a purpose, intellectual culture is needed, and this discipline the Greeks acquired under their Sophists. This mental culture then became the means, in the hands of those who possessed it, of enforcing their views and interests on the Demos: the expert Sophist knew how to turn the subject of discussion this way or that way at pleasure, and thus the doors were thrown wide open to all human passions. A leading principle of the Sophists was, that "Man is the measure of all things"; but in this, as in all their apophthegms, lurks an ambiguity, since the term "Man" may denote Spirit in its depth and truth, or in the aspect of mere caprice and private interest. The Sophists meant Man simply as subjective, and intended in this dictum of theirs, that mere liking was the principle of Right, and that advantage to the individual was the ground of final appeal. This Sophistic principle appears again and again, though under different forms, in various periods of History; thus even in our own times subjective opinion of what is right – mere feeling – is made the ultimate ground of decision.

In Beauty, as the Greek principle, there was a concrete unity of Spirit, united with Reality, with Country and Family, etc. In this unity no fixed point of view had as yet been adopted within the Spirit itself, and Thought, as far as it transcended this unity, was still swayed by mere liking; [the

Beautiful, the Becoming (to prepou) conducted men in the path of moral propriety, but apart from this they had no firm abstract principle of Truth and Virtue]. But Anaxagoras himself had taught, that Thought itself was the absolute Essence of the World. And it was in *Socrates,* that at the beginning of the Peloponnesian War, the principle of subjectivity – of the absolute inherent independence of Thought – attained free expression. He taught that man has to discover and recognize in himself what is the Right and Good, and that this Right and Good is in its nature universal. Socrates is celebrated as a Teacher of Morality, but we should rather call him the *Inventor of Morality.* The Greeks had a *customary* morality; but Socrates undertook to teach them what moral virtues, duties, etc. were. The moral man is not he who merely wills and does that which is right – not the merely innocent man – but he who has the consciousness of what he is doing. Socrates – in assigning to insight, to conviction, the determination of men's actions – posited the Individual as capable of a final moral decision, in contraposition to Country and to Customary Morality, and thus made himself an Oracle, in the Greek sense. He said that he had a daimonion within him, which counselled him what to do, and revealed to him what was advantageous to his friends. The rise of the inner world of Subjectivity was the rupture with the existing Reality. Though Socrates himself continued to perform his duties as a citizen, it was not the actual State and its religion, but the world of Thought that was his true home. Now the question of the existence and nature of the gods came to be discussed. The disciple of Socrates, Plato, banished from his ideal state, Homer and Hesiod, the originators of that mode of conceiving of religious objects which prevailed among the Greeks; for he desiderated a higher conception of what was to be reverenced as divine – one more in harmony with Thought. Many citizens now seceded from practical and political life, to live in the ideal world. The principle of Socrates manifests a revolutionary aspects towards the Athenian State; for



the peculiarity of this State was, that Customary Morality was the form in which its existence was moulded, viz. – an inseparable connection of Thought with actual life. When Socrates wishes to induce his friends to reflection, the discourse has always a negative tone; he brings them to the consciousness that they do not know what the Right is. But when on account of the giving utterance to that principle which was advancing to recognition, Socrates is condemned to death, the sentence bears on the one hand the aspect of unimpeachable rectitude – inasmuch as the Athenian people condemns its deadliest foe – but on the other hand, that of a deeply tragical character, inasmuch as the Athenians had to make the discovery, that what they reprobated in Socrates had already struck firm root among themselves, and that they must be pronounced guilty or innocent with him. With this feeling they condemned the accusers of Socrates, and declared him guiltless.

In Athens that higher principle which proved the ruin of the Athenian state, advanced in its development without intermission. Spirit had acquired the propensity to gain satisfaction for itself – to reflect. Even in decay the Spirit of Athens appears majestic, because it manifests itself as the free, the liberal – exhibiting its successive phases in their pure idiosyncrasy – in that form in which they really exist. Amiable and cheerful even in the midst of tragedy is the light- heartedness and nonchalance with which the Athenians accompany their [national] morality to its grave. We recognize the higher interest of the new culture in the fact that the people made themselves merry over their own follies, and found great entertainment in the comedies of Aristophanes, which have the severest satire for their contents, while they bear the stamp of the most unbridled mirth.

In Sparta the same corruption is introduced, since the social unit seeks to assert his individuality against the moral life of the community: but there we have merely the isolated side of particular subjectivity – corruption in its

undisguised form, blank immorality, vulgar selfishness and venality. All these passions manifest themselves in Sparta, especially in the persons of its generals, who, for the most part living at a distance from their country, obtain an opportunity of securing advantages at the expense of their own state as well as of those to whose assistance they are sent.

THE MACEDONIAN EMPIRE

AFTER THE FALL of Athens, Sparta took upon herself the Hegemony; but misused it – as already mentioned – so selfishly, that she was universally hated. Thebes could not long sustain the part of humiliating Sparta, and was at last exhausted in the war with the Phocians. The Spartans and the Phocians – the former because they had surprised the citadel of Thebes, the latter because they had tilled a piece of land belonging to the Delphin Apollo – had been sentenced to pay considerable sums of money. Both states however refused payment; for the Amphictyonic Council had not much more authority than the old German Diet, which the German princes obeyed only so far as suited their inclination. The Phocians were then to be punished by the Thebans; but by an egregious piece of violence – by desecrating and plundering the temple at Delphi – the former attained momentary superiority. This deed completes the ruin of Greece; the sanctuary was desecrated, the god so to speak, killed; the last support of unity was thereby annihilated; reverence for that which in Greece had been as it were always the final arbiter – its monarchical principle – was displaced, insulted, and trodden under foot.

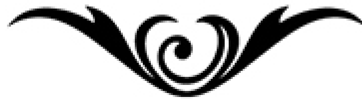
The next step in advance is then that quite simple one, that the place of the dethroned oracle should be taken by another deciding will – a *real* authoritative *royalty.* The foreign Macedonian King – Philip – undertook to avenge the violation of the oracle, and forthwith took its place, by making himself lord of Greece. Philip reduced under his dominion the Hellenic States, and convinced them that it was all over with their independence, and that they could no longer maintain their own footing. The charge of littleness, harshness, violence, and political treachery – all those hateful

characteristics with which Philip has so often been reproached – did not extend to the young Alexander, when he placed himself at the head of the Greeks. He had no need to incur such reproaches; he had not to form a military force, for he found one already in existence. As he had only to mount Bucephalus, and take the rein in hand, to make him obsequious to his will, just so he found that Macedonian phalanx prepared for his purpose – that rigid welltrained iron mass, the power of which had been demonstrated under Philip, who copied it from Epaminondas.

Alexander had been educated by the deepest and also the most comprehensive thinker of antiquity – Aristotle; and the education was worthy of the man who had undertaken it. Alexander was initiated into the profoundest metaphysics: therefore his nature was thoroughly refined and liberated from the customary bonds of mere opinion, crudities and idle fancies. Aristotle left this grand nature as untrammelled as it was before his instructions commenced; but impressed upon it a deep perception of what the True is, and formed the spirit which nature had so richly endowed to a plastic being, rolling freely like an orb through its circumambient ether.

Thus accomplished, Alexander placed himself at the head of the Hellenes, in order to lead Greece over into Asia. A youth of twenty, he commanded a thoroughly experienced army, whose generals were all veterans, well versed in the art of war. It was Alexander's aim to avenge Greece for all that Asia had inflicted upon it for so many years, and to fight out at last the ancient feud and contest between the East and the West. While in this struggle he retaliated upon the Oriental world what Greece had suffered from it, he also made a return for the rudiments of culture which had been derived thence by spreading the maturity and culmination of that culture over the East; and, as it were, changed the stamp of subjugated Asia and assimilated it to a Hellenic land. The grandeur and the interest of this work were proportioned to his genius – to his peculiar

youthful individuality – the like of which in so beautiful a form we have not seen a second time at the head of such an undertaking. For not only were the genius of a commander, the greatest spirit, and consummate bravery united in him, but all these qualities were dignified by the beauty of his character as a man and an individual. Though his generals were devoted to him, they had been the long tried servants of his father; and this made his position difficult: for his greatness and youth was a humiliation to them, as inclined to regard themselves and the achievements of the past, as a complete work; so that while their envy, as in Clitus's case, arose to blind rage, Alexander also was excited to great violence.



Alexander's expedition to Asia was at the same time a journey of discovery; for it was he who first opened the Oriental World to the Europeans, and penetrated into countries – as *e.g.* Bactria, Sogdiana, northern India – which have since been hardly visited by Europeans. The arrangement of the march, and not less the military genius displayed in the disposition of battles, and in tactics generally, will always remain an object of admiration. He was great as a commander in battles, wise in conducting marches and marshalling troops, and the bravest soldier in the thick of the fight. Even the death of Alexander, which occurred at Babylon in the three-and-thirtieth year of his age, gives us a beautiful spectacle of his greatness, and shows in what relation he stood to his army: for he takes leave of it with the perfect consciousness of his dignity.

Alexander had the good fortune to die at the proper time; *i.e.* it may be called good fortune, but it is rather a necessity. That he may stand before the eyes of posterity as a youth, an early death must hurry him away. Achilles, as remarked above, *begins* the Greek world, and his autotype Alexander *concludes* it: and these youths not only supply a picture of the fairest kind in their own persons, but at the same time afford a complete and perfect type of Hellenic existence. Alexander finished his work and completed his ideal;

and thus bequeathed to the world one of the noblest and most brilliant of visions, which our poor reflections only serve to obscure. For the great World-Historical form of Alexander, the modern standard applied by recent historical "Philistines" – that of virtue or morality – will by no means suffice. And if it be alleged in depreciation of his merit, that he had no successor, and left behind no dynasty, we may remark that the Greek kingdoms that arose in Asia after him, are his dynasty. For two years he was engaged in a campaign in Bactria, which brought him into contact with the Massagetse and Scythians; and there arose the Grseco-Bactrian kingdom which lasted for two centuries. Thence the Greeks came into connection with India, and even with China. The Greek dominion spread itself over northern India, and Sandrokottus (Chandraguptas) is mentioned as the first who emancipated himself from it. The same name presents itself indeed among the Hindoos, but for reasons already stated, we can place very little dependence upon such mention. Other Greek Kingdoms arose in Asia Minor, in Armenia, in Syria and Babylonia. But Egypt especially, among the kingdoms of the successors of Alexander, became a great centre of science and art; for a great number of its architectural works belong to the time of the Ptolemies, as has been made out from the deciphered inscriptions. Alexandria became the chief centre of commerce – the point of union for Eastern manners and tradition with Western civilization. Besides these, the Macedonian Kingdom, that of Thrace, stretching beyond the Danube, that of Illyria, and that of Epirus, flourished under the sway of Greek princes.

Alexander was also extraordinarily attached to the sciences, and he is celebrated as next to Pericles the most liberal patron of the arts. Meier says in his "History of Art," that his intelligent love of art would have secured him an immortality of fame not less than his conquests.

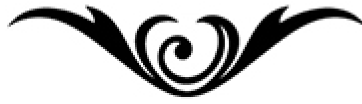
SECTION III: THE FALL OF THE GREEK SPIRIT.

THIS THIRD PERIOD in the history of the Hellenic World, which embraces the protracted development of the evil destiny of Greece, interests us less. Those who had been Alexander's Generals, now assuming an independent appearance on the stage of history as Kings, carried on long wars with each other, and experienced, almost all of them, the most romantic revolutions of fortune. Especially remarkable and prominent in this respect is the life of Demetrius Poliorcetes.

In Greece the States had preserved their existence: brought to a consciousness of their weakness by Philip and Alexander, they contrived to enjoy an apparent vitality, and boasted of an unreal independence. That self-consciousness which independence confers, they could not have; and diplomatic statesmen took the lead in the several States – orators who were not at the same time generals, as was the case formerly – *e.g.* in the person of Pericles. The countries of Greece now assume various relations to the different monarchs, who continued to contend for the sovereignty of the Greek States – partly also for their favor, especially for that of Athens: for Athens still presented an imposing figure – if not as a Power, yet certainly as the centre of the higher arts and sciences, especially of Philosophy and Rhetoric. Besides it kept itself more free from the gross excess, coarseness and passions which prevailed in the other States, and made them contemptible; and the Syrian and Egyptian kings deemed it an honor to make Athens large presents of corn and other useful supplies. To some extent too the kings of the period reckoned it their greatest glory to render and to keep the Greek cities and states independent. The *Emancipation of Greece* had as it were, become the general watch-word; and it passed for a

high title of fame to be called the *Deliverer* of Greece. If we examine the hidden political bearing of this word, we shall find that it denotes the prevention of any indigenous Greek State from obtaining decided superiority, and keeping all in a state of weakness by separation and disorganization.

The special peculiarity by which each Greek State was distinguished from the others consisted in a difference similar to that of their glorious divinities, each one of whom has his particular character and peculiar being, yet so that this peculiarity does not derogate from the divinity common to all. When therefore, this divinity has become weak and has vanished from the States, nothing but the bare particularity remains – the repulsive speciality which obstinately and waywardly asserts itself, and which on that very account assumes a position of absolute dependence and of conflict with others. Yet the feeling of weakness and misery led to combinations here and there. The *Italians* and their allies as a predatory people, set up injustice, violence, fraud, and insolence to others, as their charter of rights. Sparta was governed by infamous tyrants and odious passions, and in this condition was dependent on the Macedonian Kings. The Boeotian subjective character had, after the extinction of Theban glory, sunk down into indolence and the vulgar desire of coarse sensual enjoyment. The *Achaean* league distinguished itself by the aim of its union (the expulsion of Tyrants,) by rectitude and the sentiment of community. But this too was obliged to take refuge in the most complicated policy. What we see here on the whole is a *diplomatic* condition – an infinite involvement with the most manifold foreign interests – a subtle intertexture and play of parties, whose threads are continually being combined anew.



In the internal condition of the states, which, enervated by selfishness and debauchery, were broken up into factions – each of which on the other hand directs its attention to foreign lands, and with treachery to its native

country begs for the favors of the Kings – the point of interest is no longer the fate of these states, but the great *individuals,* who arise amid the general corruption, and honorably devote themselves to their country. They appear as great tragic characters, who with their genius, and the most intense exertion, are yet unable to extirpate the evils in question; and perish in the struggle, without having had the satisfaction of restoring to their fatherland repose, order and freedom, nay, even without having secured a reputation with posterity free from all stain. Livy says in his prefatory remarks: "In our times we can neither endure our faults nor the means of correcting them." And this is quite as applicable to these Last of the Greeks, who began an undertaking which was as honorable and noble, as it was sure of being frustrated. Agis and Cleomenes, Aratus and Philopoemen, thus sunk under the struggle for the good of their nation. Plutarch sketches for us a highly characteristic picture of these times, in giving us a representation of the importance of individuals during their continuance.

The third period of the history of the Greeks brings us to their contact with that people which was to play the next part on the theatre of the World's History; and the chief excuse for this contact was – as pretexts had previously been – the liberation of Greece. After Perseus the last Macedonian King, in the year 168 B.C. had been conquered by the Romans and brought in triumph to Rome, the Achaean league was attacked and broken up, and at last in the year 146 B.C. Corinth was destroyed. Looking at Greece as Polybius describes it, we see how a noble nature such as his, has nothing left for it but to despair at the state of affairs and to retreat into Philosophy; or if it attempts to act, can only die in the struggle. In deadly contraposition to the multiform variety of passion which Greece presents – that distracted condition which whelms good and evil in one common ruin – stands a blind fate – an iron power ready to show up that degraded condition in all its weakness, and to dash it to pieces in miserable ruin; for

cure, amendment, and consolation are impossible. And this crushing Destiny is the *Roman power.*

PART III: THE ROMAN WORLD

NAPOLEON, IN A conversation which he once had with Goethe on the nature of Tragedy, expressed the opinion that its modern phase differed from the ancient, through our no longer recognizing a Destiny to which men are absolutely subject, and that Policy occupies the place of the ancient Fate [*La politique est la fatalité*]. This therefore he thought must be used as the modern form of Destiny in Tragedy – the irresistible power of circumstances to which individuality must bend. Such a power is the *Roman World,* chosen for the very purpose of casting the moral units into bonds, as also of collecting all Deities and all Spirits into the Pantheon of Universal dominion, in order to make out of them an abstract universality of power. The distinction between the Roman and the Persian principle is exactly this – that the former stifles all vitality, while the latter allowed of its existence in the fullest measure. Through its being the aim of the State, that the social units in their moral life should be sacrificed to it, the world is sunk in melancholy: its heart is broken, and it is all over with the Natural side of Spirit, which has sunk into a feeling of unhappiness. Yet only from this feeling could arise the supersensuous, the free Spirit in Christianity.

In the Greek principle we have seen spiritual existence in its exhilaration – its cheerfulness and enjoyment: Spirit had not yet drawn back into abstraction; it was still involved with the Natural element – the idiosyncrasy of individuals; – on which account the virtues of individuals themselves became moral works of art. Abstract universal Personality had not yet appeared, for Spirit must first develop itself to that form of abstract Universality which exercised the severe discipline over humanity now under consideration. Here, in Rome, then, we find that free universality, that

abstract Freedom, which on the one hand sets an abstract state, a political constitution and power, over *concrete* individuality; on the other side creates a personality in opposition to that universality – the inherent freedom of the *abstract* Ego, which must be distinguished from individual idiosyncrasy. For Personality constitutes the fundamental condition of legal Right: it appears chiefly in the category of Property, but it is indifferent to the concrete characteristics of the living Spirit with which individuality is concerned. These two elements, which constitute Rome – political Universality on the one hand, and the abstract freedom of the individual on the other – appear, in the first instance, in the form of Subjectivity. This Subjectivity – this retreating into one's self which we observed as the corruption of the Greek Spirit – becomes here the ground on which a new side of the World's History arises. In considering the Roman World, we have not to do with a concretely spiritual life, rich in itself; but the world-historical element in it is the *abstractum* of Universality, and the object which is pursued with soulless and heartless severity, is mere *dominion,* in order to enforce that *abstractum.*

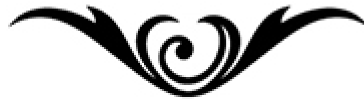
In Greece, *Democracy* was the fundamental condition of political life, as in the East, *Despotism;* here we have *Aristocracy* of a rigid order, in a state of opposition to the people. In Greece also the Democracy was rent asunder, but only in the way of factions; in Rome it is principles that keep the entire community in a divided state – they occupy a hostile position towards, and struggle with each other: first the Aristocracy with the Kings, then the Plebs with the Aristocracy, till Democracy gets the upper hand ; then first arise factions in which originated that later aristocracy of commanding individuals which subjugated the world. It is this dualism that, properly speaking, marks Rome's inmost being.

Erudition has regarded the Roman History from various points of view, and has adopted very different and opposing opinions: this is especially the

case with the more ancient part of the history, which has been taken up by three different classes of literati – Historians, Philologists, and Jurists. The Historians hold to the grand features, and show respect for the history as such; so that we may after all see our way best under their guidance, since they allow the validity of the records in the case of leading events. It is otherwise with the Philologists, by whom generally received traditions are less regarded, and who devote more attention to small details which can be combined in various ways. These combinations gain a footing first as historical hypotheses, but soon after as established facts. To the same degree as the Philologists in their department, have the Jurists in that of Roman law, instituted the minutest examination and involved their inferences with hypothesis. The result is that the most ancient part of Roman History has been declared to be nothing but fable; so that this department of inquiry is brought entirely within the province of learned criticism, which always finds the most to do where the least is to be got for the labor. While on the one side the poetry and the myths of the Greeks are said to contain profound historical truths, and are thus transmuted into history, the Romans on the contrary have myths and poetical views affiliated upon them; and epopees are affirmed to be at the basis of what has been hitherto taken for prosaic and historical.

With these preliminary remarks we proceed to describe the *Locality.*

The Roman World has its centre in Italy; which is extremely similar to Greece, and, like it, forms a peninsula, only not so deeply indented. Within this country, the city of Rome itself formed the centre of the centre. Napoleon in his Memoirs takes up the question, which city – if Italy were independent and formed a totality – would be best adapted for its capital. Rome, Venice, and Milan may put forward claims to the honor; but it is immediately evident that none of these cities would supply a centre. Northern Italy constitutes a basin of the river Po, and is quite distinct from



the body of the peninsula; Venice is connected only with Higher Italy, not with the south; Rome, on the other hand, would, perhaps, be naturally a centre for Middle and Lower Italy, but only artificially and violently for those lands which were subjected to it in Higher Italy. The Roman State rests geographically, as well as historically, on the clement of force. The locality of Italy, then, presents no natural unity – as the valley of the Nile; the unity was similar to that which Macedonia by its sovereignty gave to Greece; though Italy wanted that permeation by one spirit, which Greece possessed through equality of culture; for it was inhabited by very various races. Niebuhr has prefaced his Roman history by a profoundly erudite treatise on the peoples of Italy; but from which no connection between them and the Roman History is visible. In fact, Niebuhr's History can only be regarded as a *criticism* of Roman History, for it consists of a series of treatises which by no means possess the unity of history.

We observed subjective inwardness as the general principle of the Roman World. The course of Roman History, therefore, involves the expansion of undeveloped subjectivity – inward conviction of existence – to the visibility of the real world. The principle of subjective inwardness receives positive application in the first place only from without – through the particular volition of the sovereignty, the government, etc. The development consists in the purification of inwardness to abstract personality, which gives itself reality in the existence of private property; the mutually repellent social units can then be held together only by despotic power. The general course of the Roman World may be defined as this; the transition from the inner sanctum of subjectivity to its direct opposite. The development is here not of the same kind as that in Greece – the unfolding and expanding of its own substance on the part of the principle; but it is the transition to its opposite, which latter does not appear as an element of corruption, but is demanded and posited by the principle

itself. – As to the particular sections of the Roman History, the common division is that into the Monarchy, the Republic, and the Empire – as if in these forms different principles made their appearance; but the same principle – that of the Roman Spirit – underlies their development. In our division, we must rather keep in view the course of History generally. 1 he annals of every Worldhistorical people were divided above into three periods, and this statement must prove itself true in this case also. *The first period* comprehends the rudiments of Rome, in which the elements which are essentially opposed, still repose in calm unity; until the contrarieties have acquired strength, and the unity of the State becomes a powerful one, through that antithetical condition having been produced and maintained within it. In this vigorous condition the State directs its forces outwards – *i.e.,* in the *second period* – and makes its *debut* on the theatre of general history; this is the noblest Period of Rome – the Punic Wars and the contact with the antecedent World-Historical people. A wider stage is opened, towards the East; the history at the epoch of this contact has been treated by the noble Polybius. The Roman Empire now acquired that world-conquering extension which paved the way for its fall. Internal distraction supervened, while the antithesis was developing itself to self-contradiction and utter incompatibility; it closes with Despotism, which marks the *third period.* The Roman power appears here in its pomp and splendor; but it is at the same time profoundly ruptured within itself, and the Christian Religion, which begins with the imperial dominion, receives a great extension. The third period comprises the contact of Rome with the North and the German peoples, whose turn is now come to play their part in History.

SECTION I: ROME TO THE TIME OF THE SECOND PUNIC WAR.

CHAPTER I. THE ELEMENTS OF THE ROMAN SPIRIT

Before we come to the Roman History, we have to consider the *Elements of the Roman Spirit* in general, and mention and investigate the origin of Rome with a reference to them. Rome arose *outside recognised countries,* viz., in an angle where three different districts met – those of the Latins, Sabines and Etruscans; it was not formed from some ancient stem, connected by natural patriarchal bonds, whose origin might be traced up to remote times (as seems to have been the case with the Persians, who, however, even then ruled a large empire); but Rome was from the very beginning, of artificial and violent, not spontaneous growth. It is related that the descendants of the Trojans, led by Æneas to Italy, founded Rome; for the connection with Asia was a much cherished tradition, and there are in Italy, France, and Germany itself (Xanten) many towns which refer their origin, or their names, to the fugitive Trojans. Livy speaks of the ancient tribes of Rome, the Ramnenses, Titienses, and Luceres. Now if we look upon these as distinct nations, and assert that they were really the elements from which Rome was formed – a view which in recent times has very often striven to obtain currency – we directly subvert the historical tradition. All historians agree that at an early period, shepherds, under the leadership of chieftains, roved about on the hills of Rome; that the first Roman community constituted itself as a predatory state; and that it was with difficulty that the scattered inhabitants of the vicinity were thus united. The details of these circumstances are also given Those predatory shepherds received every contribution to their community that chose to join them (Livy calls it a *colluvies*). The rabble of all the three districts between which Rome lay, was collected in the new city. The historians state that this point

was very well chosen on a hill close to the river, and particularly adapted to make it an asylum for all delinquents. It is equally historical that in the newly formed state there were no women, and that the neighboring states would enter into no *connubia* with it: both circumstances characterize it as predatory union, with which the other states wished to have no connection. They also refused the invitation to their religious festivals; and only the Sabines – a simple agricultural people, among whom, as Livy says, prevailed a *tristis atque tetrica superstitio* – partly from superstition, partly from fear, presented themselves at them. The seizure of the Sabine women is also a universally received historical fact. This circumstance itself involves a very characteristic feature, *viz.,* that Religion is used as a means for furthering the purposes of the infant State. Another method of extension was the conveying to Rome of the inhabitants of neighboring and conquered towns. At a later date there was also a voluntary migration of foreigners to Rome; as in the case of the so celebrated family of the Claudii, bringing their whole clientela. The Corinthian Demaratus, belonging to a family of consideration, had settled in Etruria; but as being an exile and a foreigner, he was little respected there, and his son, Lucumo, could no longer endure this degradation. He betook himself to Rome, says Livy, because a *new* people and a *repentin a atque ex virtute nobilitas* were to be found there. Lucumo attained, we are told, such a degree of respect, that he afterwards became king.

It is this peculiarity in the founding of the State which must be regarded as the essential basis of the idiosyncrasy of Rome. For it directly involves the severest discipline, and self-sacrifice to the grand object of the union. A State which had first to form itself, and which is based on force, must be held together by force. It is not a moral, liberal connection, but a compulsory condition of subordination, that results from such an origin. The Roman *virtus* is valor; not, however, the merely personal, but that

which is essentially connected with a union of associates ; which union is regarded as the supreme interest, and may be combined with lawless violence of all kinds. While the Romans formed a union of this kind, they were not, indeed, like the Lacedaemonians, engaged in an internal contest with a conquered and subjugated people; but there arose a distinction and a struggle between *Patricians* and *Plebeians.* This distinction was mythically adumbrated in the hostile brothers, Romulus and Remus. Remus was buried on the Aventine mount; this is consecrated to the evil genii, and to it are directed the Secessions of the Plebs. The question comes, then, how this distinction originated? It has been already said, that Rome was formed by robber-herdsmen, and the concourse of rabble of all sorts. At a later date, the inhabitants of captured and destroyed towns were also conveyed thither. The weaker, the poorer, the later additions of population are naturally underrated by, and in a condition of dependence upon those who originally founded the state, and those who were distinguished by valor, and also by wealth. It is not necessary, therefore, to take refuge in a hypothesis which has recently been a favorite one – that the Patricians formed a particular race.

The dependence of the Plebeians on the Patricians is often represented as a perfectly legal relation – indeed, even a sacred one; since the Patricians had the *sacra* in their hands, while the plebs would have been godless, as it were, without them. The Plebeians left to the Patricians their hypocritical stuff (*ad decipiendam plebem,* Cic.) and cared nothing for their sacra and auguries; but in disjoining political rights from these ritual observances, and making good their claim to those rights, they were no more guilty of a presumptuous sacrilege than the Protestants, when they emancipated the political power of the State, and asserted the freedom of conscience. The light in which, as previously stated, we must regard the relation of the Patricians and Plebeians is, that those who were poor, and consequently

helpless, were compelled to attach themselves to the richer and more respectable, and to seek for their *patrocinium:* in this relation of protection on the part of the more wealthy, the protected are called *clientes.* But we find very soon a fresh distinction between the plebs and the clientes. In the contentions between the Patricians and the Plebeians, the clientes held to their patroni, though belonging to the plebs as decidedly as any class. That this relation of the clientes had not the stamp of right and law is evident from the fact, that with the introduction and knowledge of the laws among all classes, the cliental relation gradually vanished; for as soon as individuals found protection in the law, the temporary necessity for it could not but cease.

In the first predatory period of the state, every citizen was necessarily a soldier, for the state was based on war; this burden was oppressive, since every citizen was obliged to maintain himself in the field. This circumstance, therefore, gave rise to the contracting of enormous debts – the Patricians becoming the creditors of the Plebeians. With the introduction of laws, this arbitrary relation necessarily ceased; but only gradually, for the Patricians were far from being immediately inclined to release the plebs from the cliental relation; they rather strove to render it permanent. The laws of the Twelve Tables still contained much that was undefined; very much was still left to the arbitrary will of the judge – the Patricians alone being judges; the antithesis, therefore, between Patricians and Plebeians, continues till a much later period. Only by degrees do the Plebeians scale all the heights of official station, and attain those privileges which formerly belonged to the Patricians alone.

In the life of the Greeks, although it did not any more than that of the Romans originate in the patriarchal relation, *Family* love and the Family tie appeared at its very commencement, and the peaceful aim of their social existence had for its necessary condition the extirpation of freebooters both

by sea and land. The founders of Rome, on the contrary – Romulus and Remus – are, according to the tradition, themselves freebooters – represented as from their earliest days thrust out from the Family, and as having grown up in a state of isolation from family affection. In like manner, the first Romans are said to have got their wives, not by free courtship and reciprocated inclination, but by force. This commencement of the Roman life in savage rudeness excluding the sensibilities of natural morality, brings with it one characteristic element – harshness in respect to the family relation; a selfish harshness, which constituted the fundamental condition of Roman manners and laws, as we observe them in the sequel. We thus find family relations among the Romans not as a beautiful, free relation of love and feeling; the place of confidence is usurped by the principle of severity, dependence, and subordination. Marriage, in its strict and formal shape, bore quite the aspect of a mere contract; the wife was part of the husband's property (*in manum conventio*), and the marriage ceremony was based on a *cocmtio,* in a form such as might have been adopted on the occasion of any other purchase. The husband acquired a power over his wife, such as he had over his daughter; nor less over her property; so that everything which she gained, she gained for her husband. During the good times of the republic, the celebration of marriages included a religious ceremony – *confarreatio* – but which was omitted at a later period. The husband obtained not less power than by the *coemtio,* when he married according to the form called *usiis,* that is, when the wife remained in the house of her husband without having been absent a *trinoctium* in a year. If the husband had not married in one of the forms of the *in manum conventio,* the wife remained either in the power of her father, or under the guardianship of her *agnates,* and was free as regarded her husband. The Roman matron, therefore, obtained honor and dignity only through independence of her husband, instead of acquiring her honor through her

husband and by marriage. If a husband who had married under the freer condition – that is, when the union was not consecrated by the *confarreatio* – wished to separate from his wife, he dismissed her without further ceremony. The relation of sons was perfectly similar: they were, on the one hand, about as dependent on the paternal power as the wife on the matrimonial; they could not possess property – it made no difference whether they filled a high office in the State or not (though the *peculia castrensia,* and *adventitia* were differently regarded) ; but on the other hand, when they were emancipated, they had no connection with their father and their family. An evidence of the degree in which the position of children was regarded as analogous to that of slaves, is presented in the *imaginaria servitus* (*mancipium*), through which emancipated children had to pass. In reference to inheritance, morality would seem to demand that children should share equally. Among the Romans, on the contrary, testamentary caprice manifests itself in its harshest form. Thus perverted and demoralized, do we here see the fundamental relations of ethics. The immoral active severity of the Romans in this private side of character, necessarily finds its counterpart in the passive severity of their political union. For the severity which the Roman experienced from the State he was compensated by a severity, identical in nature, which he was allowed to indulge towards his family – a servant on the one side, a despot on the other. This constitutes the Roman greatness, whose peculiar characteristic was stern inflexibility in the union of individuals with the State, and with its law and mandate. In order to obtain a nearer view of this Spirit, we must not merely keep in view the actions of Roman heroes, confronting the enemy as soldiers or generals, or appearing as ambassadors – since in these cases they belong, with their whole mind and thought, only to the state and its mandate, without hesitation or yielding – but pay particular attention also to the conduct of the plebs in times of revolt against the patricians. How often

in insurrection and in anarchical disorder was the plebs brought back into a state of tranquillity by a mere form, and cheated of the fulfilment of its demands, righteous or unrighteous! How often was a Dictator, *e.g.,* chosen by the senate, when there was neither war nor danger from an enemy, in order to get the plebeians into the army, and to bind them to strict obedience by the military oath! It took Licinius ten years to carry laws favorable to the plebs; the latter allowed itself to be kept back by the mere formality of the veto on the part of other tribunes, and still more patiently did it wait for the long-delayed execution of these laws. It may be asked: By what were such a disposition and character produced? Produced it cannot be, but it is essentially latent in the origination of the State from that primal robber-community, as also in the idiosyncrasy of the people who composed it, and lastly, in that phase of the World-Spirit which was just ready for development. The elements of the Roman people were Etruscan, Latin and Sabine; these must have contained an inborn natural adaptation to produce the Roman Spirit. Of the spirit, the character, and the life of the ancient Italian peoples we know very little – thanks to the non-intelligent character of Roman historiography! – and that little, for the most part, from the Greek writers on Roman history. But of the general character of the Romans we may say that, in contrast with that primeval wild poetry and transmutation of the finite, which we observe in the East – in contrast with the beautiful, harmonious poetry and well-balanced freedom of Spirit among the Greeks – here, among the Romans the *prose* of life makes its appearance – the self-consciousness of finiteness – the abstraction of the Understanding and a rigorous principle of personality, which even in the Family does not expand itself to natural morality, but remains the unfeeling non-spiritual unit, and recognizes the uniting bond of the several social units only in abstract universality.

This extreme prose of the Spirit we find in Etruscan art, which though technically perfect and so far true to nature, has nothing of Greek Ideality and Beauty: we also observe it in the development of Roman Law and in the Roman religion. To the constrained, non-spiritual, and unfeeling intelligence of the Roman world we owe the origin and the development of *positive law.* For we saw above, how in the East, relations in their very nature belonging to the sphere of outward or inward morality, were made legal mandates; even among the Greeks, morality was at the same time juristic right, and on that very account the constitution was entirely dependent on morals and disposition, and had not yet a fixity of principle within it, to counterbalance the mutability of men's inner life and individual subjectivity. The Romans then completed this important separation, and discovered a principle of right, which is external – *i.e.* one not dependent on disposition and sentiment. While they have thus bestowed upon us a valuable gift, in point of *form,* we can use and enjoy it without becoming victims to that sterile Understanding – without regarding it as the *ne plus ultra* of Wisdom and Reason. They were its victims, living beneath its sway; but they thereby secured for others Freedom of Spirit – viz., that inward Freedom which has consequently become emancipated from the sphere of the Limited and the External. Spirit, Soul, Disposition, Religion have now no longer to fear being involved with that abstract juristical Understanding. Art too has its external side; when in Art the mechanical side has been brought to perfection, Free Art can arise and display itself. But those must be pitied who knew of nothing but that mechanical side, and desired nothing further; as also those who, when Art has arisen, still regard the Mechanical as the highest. We see the Romans thus bound up in that abstract understanding which pertains to finiteness. This is their highest characteristic, consequently also their highest consciousness, in Religion. In fact, constraint was the religion of the Romans; among the Greeks, on the

contrary, it was the cheerfulness of free fantasy. We are accustomed to regard Greek and Roman religion as the same, and use the names Jupiter, Minerva, etc. as Roman deities, often without distinguishing them from those of Greeks. This is admissible inasmuch as the Greek divinities were more or less introduced among the Romans; but as the Egyptian religion is by no means to be regarded as identical with the Greek, merely because Herodotus and the Greeks form to themselves an idea of the Egyptian divinities under the names "Latona," "Pallas," etc., so neither must the Roman be confounded with the Greek. We have said that in the Greek religion the thrill of awe suggested by Nature was fully developed to something Spiritual – to a free conception, a spiritual form of fancy – that the Greek Spirit did not remain in the condition of inward fear, but proceeded to make the relation borne to man by Nature, a relation of freedom and cheerfulness. The Romans, on the contrary, remained satisfied with a dull, stupid subjectivity; consequently, the external was only an Object – something alien, something hidden. The Roman spirit which thus remained involved in subjectivity, came into a relation of constraint and dependence, to which the origin of the word "re-ligio" (lig-are) points. The Roman had always to do with something *secret*; in everything he believed in and sought for something *concealed*; and while in the Greek religion everything is open and clear, present to sense and contemplation – not pertaining to a future world, but something friendly, and of this world – among the Romans everything exhibits itself as mysterious, duplicate: they saw in the object first itself, and then that which lies concealed in it: their history is pervaded by this duplicate mode of viewing phenomena. The city of Rome had besides its proper name another secret one, known only to a few. It is believed by some to have been "Valentia," the Latin translation of "Roma"; others think it was "Amor" ("Roma" read backwards). Romulus, the founder of the State, had also another, a sacred name – "Quirinus" – by

which title he was worshipped: the Romans too were also called Quirites. (This name is connected with the term "curia": in tracing its etymology the name of the Sabine town "Cures," has been had recourse to.) Among the Romans the religious thrill of awe remained undeveloped; it was shut up to the mere subjective certainty of its own existence. Consciousness has therefore given itself no spiritual objectivity – has not elevated itself to the theoretical contemplation of the eternally divine nature, and to freedom in that contemplation; it has gained no religious substantiality for itself from Spirit. The bare subjectivity of conscience is characteristic of the Roman in all that he does and undertakes – in his covenants, political relations, obligations, family relations, etc.; and all these relations receive thereby not merely a legal sanction, but as it were a solemnity analogous to that of an oath. The infinite number of ceremonies at the comitia, on assuming offices, etc., are expressions and declarations that concern this firm bond. Everywhere the sacra play a very important part. Transactions, naturally the most alien to constraint, became a *sacrum,* and were petrified, as it were, into that. To this category belongs, *e.g.,* in strict marriages, the *confarreatio,* and the auguries and auspices generally. The knowledge of these *sacra* is utterly uninteresting and wearisome, affording fresh material for learned research as to whether they are of Etruscan, Sabine, or other origin. On their account the Roman people have been regarded as extremely pious, both in positive and negative observances; though it *is* ridiculous to hear recent writers speak with unction and respect of these *sacra.* The Patricians were especially fond of them; they have therefore been elevated in the judgment of some, to the dignity of sacerdotal families, and regarded as the sacred gentes – the possessors and conservators of Roman religion: the plebeians then become the godless element. On this head what is pertinent has already been said. The ancient kings were at the same time also *reges sacrorum.* After the royal dignity had been done away with, there still remained a *Rex*

Sacrorum; but he, like all the other priests, was subject to the *Pontifex Maximus,* who presided over all the “sacra,” and gave them such a rigidity and fixity as enabled the patricians to maintain their religious power so long.

But the essential point in pious feeling is the subject matter with which it occupies itself – though it is often asserted, on the contrary, in modern times, that if pious feelings exist, it is a matter of indifference what object occupies them. It has been already remarked of the Romans, that their religious subjectivity did not expand into a free spiritual and moral comprehensiveness of being. It can be said that their piety did not develop itself into religion; for it remained essentially formal, and this formalism took its real side from another quarter. From the very definition given, it follows that it can only be of a finite, unhallowed order, since it arose outside the secret sanctum of religion. The chief characteristic of Roman Religion is therefore a hard and dry contemplation of certain voluntary aims, which they regard as existing absolutely in their divinities, and whose accomplishment they desire of them as embodying absolute power, These purposes constitute that for the sake of which they worship the gods, and by which, in a constrained, limited way, they are bound to their deities. The Roman religion is therefore the entirely *prosaic* one of narrow aspirations, expediency, profit. The divinities peculiar to them are entirely prosaic; they are conditions [of mind or body], sensations, or useful arts, to which their dry fancy, having elevated them to independent power, gave objectivity; they are partly abstractions, which could only become frigid allegories – partly conditions of being which appear as bringing advantage or injury, and which were presented as objects of worship in their original bare and limited form. We can but briefly notice a few examples. The Romans worshipped “Pax,” “Tranquillitas,” “Vacuna” (Repose), “Angeronia” (Sorrow and Grief), as divinities; they consecrated altars to the Plague, to

Hunger, to Mildew (Robigo), to Fever, and to the Dea Cloacina. Juno appears among the Romans not merely as "Lucina," the obstetric goddess, but also as "Juno Ossipagina," the divinity who forms the bones of the child, and as "Juno Unxia," who anoints the hinges of the doors at marriages (a matter which was also reckoned among the "sacra"). How little have these prosaic conceptions in common with the beauty of the spiritual powers and deities of the Greeks! On the other hand, Jupiter as "Jupiter Capitolinus" represents the generic essence of the Roman Empire, which is also personified in the divinities "Roma" and "Fortuna Publica."

It was the Romans especially who introduced the practice of not merely supplicating the gods in time of need, and celebrating "lectisternia," but of also making solemn promises and vows to them. For help in difficulty they sent even into foreign countries, and imported foreign divinities and rites. The introduction of the gods and most of the Roman temples thus arose from necessity – from a vow of some kind, and an obligatory, not disinterested acknowledgment of favors. The Greeks on the contrary erected and instituted their beautiful temples, and statues, and rites, from love to beauty and divinity for their own sake.

Only one side of the Roman religion exhibits something attractive, and that is the festivals, which bear a relation to country life, and whose observance was transmitted from the earliest times. The idea of the *Saturnian* time is partly their basis – the conception of a state of things antecedent to and beyond the limits of civil society and political combination; but their import is partly taken from Nature generally – the Sun, the course of the year, the seasons, months, etc., (with astronomical intimations) – partly from the particular aspects of the course of Nature, as bearing upon pastoral and agricultural life. There were festivals of sowing and harvesting and of the seasons; the principal was that of the Saturnalia, etc. In this aspect there appears much that is naive and ingenuous in the

tradition. Yet this series of rites, on the whole, presents a very limited and prosaic appearance; deeper views of the great powers of nature and their generic processes are not deducible from them; for they are entirely directed to external vulgar advantage, and the merriment they occasioned, degenerated into a buffoonery unrelieved by intellect. While among the Greeks their tragic art developed itself from similar rudiments, it is on the other hand remarkable that among the Romans the scurrilous dances and songs connected with the rural festivals were kept up till the latest periods without any advance from this naive but rude form to anything really artistic.

It has already been said that the Romans adopted the *Greek* Gods, (the mythology of the Roman poets is entirely derived from the Greeks); but the worship of these beautiful gods of the imagination appears to have been among them of a very cold and superficial order. Their talk of Jupiter, Juno, Minerva sounds like a mere theatrical mention of them. The Greeks made their Pantheon the embodiment of a rich intellectual material, and adorned it with bright fancies; it was to them an object calling forth continual invention and exciting thoughtful reflection; and an extensive, nay inexhaustible, treasure has thus been created for sentiment, feeling and thought in their mythology. The Spirit of the Romans did not indulge and delight itself in that play of a thoughtful fancy; the Greek mythology appears lifeless and exotic in their hands. Among the Roman poets – especially Virgil – the introduction of the gods is the product of a frigid Understanding and of imitation. The gods are used in these poems as machinery, and in a merely superficial way; regarded much in the same way as in our didactic treatises on the belleslettres, where among other directions we find one relating to the use of such/machinery in epics – in order to produce astonishment.

The Romans were as essentially different from the Greeks in respect to their public *games.* In these the Romans were, properly speaking, only spectators. The mimetic and theatrical representation, the dancing, foot-racing and wrestling, they left to manumitted slaves, gladiators, or criminals condemned to death. Nero's deepest degradation was his appearing on a public stage as a singer, lyrist and combatant. As the Romans were only spectators, these diversions were something foreign to them; they did not enter into them with their whole souls. With increasing luxury the taste for the baiting of beasts and men became particularly keen. Hundreds of bears, lions, tigers, elephants, crocodiles, and ostriches, were produced, and slaughtered for mere amusement. A body consisting of hundreds, nay thousands of gladiators, when entering the amphitheatre at a certain festival to engage in a sham sea-fight, addressed the Emperor with the words: "Those who are devoted to death salute thee," to excite some compassion. In vain! the whole were devoted to mutual slaughter. In place of human sufferings in the depths of the soul and spirit, occasioned by the contradictions of life, and which find their solution in Destiny, the Romans instituted a cruel reality of corporeal sufferings: blood in streams, the rattle in the throat which signals death, and the expiring gasp were the scenes that delighted them. – This cold negativity of naked murder exhibits at the same time that murder of all spiritual objective aim which had taken place in the soul. I need only mention, in addition, the auguries, auspices, and Sibylline books, to remind you how fettered the Romans were by superstitions of all kinds, and how they pursued exclusively their own aims in all the observances in question. The entrails of beasts, flashes of lightning, the flight of birds, the Sibylline dicta determined the administration and projects of the State. All this was in the hands of the patricians, who consciously made use of it as a mere outward [non-spiritual, secular] means of constraint to further their own ends and oppress the people.

The distinct elements of Roman religion are, according to what has been said, subjective religiosity and a ritualism having for its object purely superficial external aims. Secular aims are left entirely free, instead of being limited by religion – in fact they are rather justified by it. The Romans are invariably pious, whatever may be the substantial character of their actions. But as the sacred principle here is nothing but an empty form, it is exactly of such a kind that it can be an instrument in the power of the devotee; it is taken possession of by the individual, who seeks his private objects and interests; whereas the truly Divine possesses on the contrary a concrete power in itself. But where there is only a powerless form, the individual – the Will, possessing an independent concreteness able to make that form its own, and render it subservient to its views – stands above it. This happened in Rome on the part of the patricians. The possession of sovereignty by the patricians is thereby made firm, sacred, incommunicable, peculiar: the administration of government, and political privileges, receive the character of hallowed private property. There does not exist therefore a substantial national unity – not that beautiful and moral necessity of united life in the Polis; but every "gens" is itself firm, stern, having its own Penates and sacra; each has it own political character, which it always preserves: strict, aristocratic severity distinguished the Claudii; benevolence towards the people, the Valerii; nobleness of spirit, the Cornelii. Separation and limitation were extended even to marriage, for the *connubia* of patricians with plebeians were deemed profane. But in that very subjectivity of religion we find also the principle of arbitrariness: and while on the one hand we have arbitrary choice invoking religion to bolster up private possession, we have on the other hand the revolt of arbitrary choice against religion. For the same order of things can, on the one side, be regarded as privileged by its religious form, and on the other side wear the aspect of being merely a matter of choice – of arbitrary volition on the part of man.

When the time was come for it to be degraded to the rank of a mere form, it was necessarily known and treated as a form – trodden under foot – represented as formalism. – The inequality which enters into the domain of sacred things forms the transition from religion to the bare reality of political life. The consecrated inequality of will and of private property constitutes the fundamental condition of the change. The Roman principle admits of *aristocracy* alone as the constitution proper to it, but which directly manifests itself only in an antithetical form – internal inequality. Only from necessity and the pressure of adverse circumstances is this contradiction momentarily smoothed over; for it involves a duplicate power, the sternness and malevolent isolation of whose components can only be mastered and bound together by a still greater sternness, into a unity maintained by force.

CHAPTER II. THE HISTORY OF ROME TO THE SECOND PUNIC WAR

IN THE FIRST period, several successive stages display their characteristic varieties. The Roman State here exhibits its first phase of growth, under Kings; then it receives a republican constitution, at whose head stand Consuls. The struggle between patricians and plebeians begins; and after this has been set at rest by the concession of the plebeian demands, there ensues a state of contentment in the internal affairs of Rome, and it acquires strength to combat victoriously with the nation that preceded it on the stage of general history. As regards the accounts of the first Roman kings, every datum has met with flat contradiction as the result of criticism; but it is going too far to deny them all credibility. Seven kings in all, are mentioned by tradition; and even the "Higher Criticism" is obliged to recognize the last links in the series as perfectly historical. Romulus is called the founder of this union of freebooters; he organized it into a military state. Although the traditions respecting him appear fabulous, they only contain what is in accordance with the Roman Spirit as above described. To the second king, Numa, is ascribed the introduction of the religious ceremonies. This trait is very remarkable from its implying that religion was introduced later than political union, while among other peoples religious traditions make their appearance in the remotest periods and before all civil institutions. The king was at the same time a priest (*rex* is referred by etymologists to rexein – to sacrifice. As is the case with states generally, the Political was at first united with the Sacerdotal, and a theocratical state of things prevailed. The King stood here at the head of those who enjoyed privileges in virtue of the *sacra*.

The separation of the distinguished and powerful citizens as senators and patricians took place as early as the first kings. Romulus is said to have appointed 100 *patres,* respecting which however the Higher Criticism is sceptical. In religion, arbitrary ceremonies – the *sacra* – became fixed marks of distinction, and peculiarities of the *gentes* and orders. The internal organization of the State was gradually realized. Livy says that as Numa established all divine matters, so Servius Tullius introduced the different Classes, and the Census, according to which the share of each citizen in the administration of public affairs was determined. The patricians were discontented with this scheme, especially because Servius Tullius abolished a part of the debts owed by the plebeians, and gave public lands to the poorer citizens, which made them possessors of landed property. He divided the people into six classes, of which the first together with the knights formed ninety-eight centuries, the inferior classes proportionately fewer. Thus, as they voted by centuries, the class first in rank had also the greatest weight in the State. It appears that previously the patricians had the power exclusively in their hands, but that after Servius's division they had merely a preponderance; which explains their discontent with his institutions. With Servius the history becomes more distinct; and under him and his predecessor, the elder Tarquinius, traces of prosperity are exhibited. Niebuhr is surprised that according to Dionysius and Livy, the most ancient constitution was democratic, inasmuch as the vote of every citizen had equal weight in the assembly of the people. But Livy only says that Servius abolished the *suffragium viritim.* Now in the *comitia curiata* – the cliental relation, which absorbed the plebs, extending to all – the patricians alone had a vote, and *populus* denoted at that time only the patricians. Dionysius therefore does not contradict himself, when he says that the constitution according to the laws of Romulus was strictly aristocratic. Almost all the Kings were foreigners – a circumstance very characteristic of the origin of

Rome. Numa, who succeeded the founder of Rome, was according to the tradition, one of the Sabines – a people which under the reign of Romulus, led by Tatius, is said to have settled on one of the Roman hills. At a later date however the Sabine country appears as a region entirely separated from the Roman State. *Numa* was followed by *Tullus Hostilius,* and the very name of this king points to his foreign origin. *Ancus Martius,* the fourth king, was the grandson of Numa. *Tarquinius Priscus* sprang from a Corinthian family, as we had occasion to observe above. *Servius Tullius* was from Corniculum, a conquered Latin town; *Tarquinius Superbus* was descended from the elder Tarquinius. Under this last king Rome reached a high degree of prosperity: even at so early a period as this, a commercial treaty is said to have been concluded with the Carthaginians; and to be disposed to reject this as mythical would imply forgetfulness of the connection which Rome had, even at that time, with the Etrurians and other bordering peoples whose prosperity depended on trade and maritime pursuits. The Romans were probably even then acquainted with the art of writing, and already possessed that clearsighted comprehension which was their remarkable characteristic, and which led to that perspicuous historical composition for which they are famous. In the growth of the inner life of the state, the power of the Patricians had been much reduced; and the kings often courted the support of the people – as we see was frequently the case in the mediaeval history of Europe – in order to steal a march upon the Patricians. We have already observed this in Servius Tullius. The last king, Tarquinius Superbus, consulted the senate but little in state affairs; he also neglected to supply the place of its deceased members, and acted in every respect as if he aimed at its utter dissolution. Then ensued a state of political excitement which only needed an occasion to break out into open revolt. An insult to the honor of a matron – the invasion of that sanctum sanctorum – by the son of the king, supplied such an occasion. The kings were banished

in the year 244 of the City and 510 of the Christian Era (that is, if the building of Rome is to be dated 753 B.C.) and the royal dignity abolished forever. The Kings were expelled by the patricians, not by the plebeians ; if therefore the patricians are to be regarded as possessed of “divine right” as being a sacred race, it is worthy of note that we find them here contravening such legitimation; for the King was their High Priest. We observe on this occasion with what dignity the sanctity of marriage was invested in the eyes of the Romans. The principle of subjectivity and piety (*pudor*) was with them the religious and guarded element; and its violation becomes the occasion of the expulsion of the Kings, and later on of the Decemvirs too. We find monogamy therefore also looked upon by the Romans as an understood thing. It was not introduced by an express law; we have nothing but an incidental testimony in the Institutes, where it is said that marriages under certain conditions of relationship are not allowable, because a man may not have two wives. It is not until the reign of Diocletian that we find a law expressly determining that no one belonging to the Roman empire may have two wives, “since according to a pretorian edict also, infamy attaches to such a condition” (*cum etiam in edicto praetoris hujusmodi viri infamia notati sunt*). Monogamy therefore is regarded as naturally valid, and is based on the principle of subjectivity. – Lastly, we must also observe that royalty was not abrogated here as in Greece by suicidal destruction on the part of the royal races, but was exterminated in hate. The King, himself the chief priest, had been guilty of the grossest profanation; the principle of subjectivity revolted against the deed, and the patricians, thereby elevated to a sense of independence, threw off the yoke of royalty. Possessed by the same feeling, the plebs at a later date rose against the patricians, and the Latins and the Allies against the Romans; until the equality of the social units was restored through the whole Roman dominion (a multitude of slaves, too, being emancipated) and they were held together by simple

Despotism. Livy remarks that Brutus hit upon the right epoch for the expulsion of the kings, for that if it had taken place earlier, the state would have suffered dissolution. What would have happened, he asks, if this homeless crowd had been liberated earlier, when living together had not yet produced a mutual conciliation of dispositions? – The constitution now became in *name* republican. If we look at the matter more closely it is evident (Livy ii. 1) that no other essential change took place than the transference of the power which was previously *permanent* in the King, to *two annual* Consuls. These two, equal in power, managed military and judicial as well as administrative business; for praetors, as supreme judges, do not appear till a later date. At first all authority remained in the hands of the consuls; and at the beginning of the republic, externally and internally, the state was in evil plight. In the Roman history a period occurs as troubled as that in the Greek which followed the extinction of the dynasties. The Romans had first to sustain a severe conflict with their expelled King, who had sought and found help from the Etrurians. In the war against Porsena the Romans lost all their conquests, and even their independence : they were compelled to lay down their arms and to give hostages; according to an expression of Tacitus (Hist. 3, 72) it seems as if Porsena had even taken Rome. Soon after the expulsion of the Kings we have the contest between the patricians and plebeians; for the abolition of royalty had taken place exclusively to the advantage of the aristocracy, to which the royal power was transferred, while the plebs lost the protection which the Kings had afforded it. All magisterial and juridical power, and all property in land was at this time in the hands of the patricians; while the people, continually dragged out to war, could not employ themselves in peaceful occupations: handicrafts could not flourish, and the only acquisition the plebeians could make was their share in the booty. The patricians had their territory and soil cultivated by slaves, and assigned some of their land to their clients, who on

condition of paying taxes and contributions – as tenant cultivators, therefore – had the usufruct of it. This relation, on account of the form in which the dues were paid by the Clientes, was very similar to vassalage: they were obliged to give contributions towards the marriage of the daughters of the Patronus, to ransom him or his sons when in captivity, to assist them in obtaining magisterial offices, and to make up the losses sustained in suits at law. The administration of justice was likewise in the hands of the patricians, and that without the limitations of definite and written laws; a desideratum which at a later period the Decemvirs were created to supply. All the power of government belonged moreover to the patricians, for they were in possession of all offices – first of the consulship, afterwards of the military tribuneship and censorship (instituted A.U.C. 311) – by which the actual administration of government as likewise the oversight of it, was left to them alone. Lastly, it was the patricians who constituted the Senate. The question as to how that body was recruited appears very important. But in this matter no systematic plan was followed. Romulus is said to have founded the senate, consisting then of one hundred members; the succeeding kings increased this number, and Tarquinius Priscus fixed it at three hundred. Junius Brutus restored the senate, which had very much fallen away, *de novo.* In after times it would appear that the censors and sometimes the dictators filled up the vacant places in the senate. In the second Punic War, A.U.C. 538, a dictator was chosen, who nominated one hundred and seventyseven new senators: he selected those who had been invested with curule dignities, the plebeian Ædiles, Tribunes of the People and Quaestors, citizens who had gained *spolia opima* or the *corona civica.* Under Caesar the number of the senators was raised to eight hundred; Augustus reduced it to six hundred. It has been regarded as great negligence on the part of the Roman historians, that they give us so little information respecting the composition and redintegration of the senate. But this point

which appears to us to be invested with infinite importance, was not of *so* much moment to the Romans at large; they did not attach so much weight to formal arrangements, for their principal concern was, *how* the government was conducted. How in fact can we suppose the constitutional rights of the ancient Romans to have been so well defined, and that at a time which is even regarded as mythical, and its traditionary history as epical? The people were in some such oppressed condition as, *e.g.* the Irish were a few years ago in the British Isles, while they remained at the same time entirely excluded from the government. Often they revolted and made a secession from the city. Sometimes they also refused military service; yet it always remains a very striking fact that the senate could so long resist superior numbers irritated by oppression and practised in war; for the main struggle lasted for more than a hundred years. In the fact that the people could so long be kept in check is manifested its respect for legal order and the *sacra.* But of necessity the plebeians at last secured their righteous demands, and their debts were often remitted. The severity of the patricians their creditors, the debts due to whom they had to discharge by slave-work, drove the plebs to revolts. At first it demanded and received only what it had already enjoyed under the kings – landed property and protection against the powerful. It received assignments of land, and Tribunes of the People – functionaries that is to say, who had the power to put a veto on every decree of the senate. When this office commenced, the number of tribunes was limited to two: later there were ten of them; which however was rather injurious to the plebs, since all that the senate had to do was to gain over one of the tribunes, in order to thwart the purpose of all the rest by his single opposition. The plebs obtained at the same time the *provocatio ad populum*: that is, in every case of magisterial oppression, the condemned person might appeal to the decision of the people – a privilege of infinite importance to the plebs, and which especially irritated the patricians. At the

repeated desire of the people the *Decemviri* were nominated – the Tribunate of the People being suspended – to supply the desideratum of a determinate legislation; they perverted, as is well known, their unlimited power to tyranny; and were driven from power on an occasion entailing similar disgrace to that which led to the punishment of the Kings. The dependence of the clientela was in the meantime weakened; after the decemviral epoch the clientes are less and less prominent and are merged in the plebs, which adopts resolutions (*plebiscita*); the senate by itself could only issue *senatus consulta,* and the tribunes, as well as the senate, could now impede the comitia and elections. By degrees the plebeians effected their admissibility to all dignities and offices; but at first a plebeian consul, aedile, censor, etc., was not equal to the patrician one, on account of the sacra which the latter kept in his hands; and a long time intervened after this concession before a plebeian actually became a consul. It was the tribunus plebis, Licinius, who established the whole cycle of these political arrangements – in the second half of the fourth century, A.U.C. 387. It was he also who chiefly commenced the agitation for the *lex agraria,* respecting which so much has been written and debated among the learned of the day. The agitators for this law excited during every period very great commotions in Rome. The plebeians were practically excluded from almost all the landed property, and the object of the Agrarian Laws was to provide lands for them – partly in the neighborhood of Rome, partly in the conquered districts, to which colonies were to be then led out. In the time of the Republic we frequently see military leaders assigning lands to the people; but in every case they were accused of striving after royalty, because it was the kings who had exalted the plebs. The Agrarian Law required that no citizen should possess more than five hundred *jugera*: the patricians were consequently obliged to surrender a large part of their property. Niebuhr in particular has undertaken extensive researches respecting the agrarian laws, and has conceived

himself to have made great and important discoveries: he says, *viz.* that an infringement of the sacred right of property was never thought of, but that the state had only assigned a portion of the public lands for the use of the plebs, having always had the right of disposing of them as its own property. I only remark in passing that Hegewisch had made this discovery before Niebuhr, and that Niebuhr derived the particular data on which his assertion rests from Appian and Plutarch; that is from Greek authors, respecting whom he himself allows that we should have recourse to them only in an extreme case. How often does Livy, as well as Cicero and others, speak of the Agrarian laws, while nothing definite can be inferred from their statements! – This is another proof of the inaccuracy of the Roman historians. The whole affair ends in nothing but a useless question of jurisprudence. The land which the patricians had taken into possession or in which colonies settled, was originally public land; but it also certainly belonged to those in possession, and our information is not at all promoted by the assertion that it always remained public land. This discovery of Niebuhr's turns upon a very immaterial distinction, existing perhaps in his ideas, but not in reality. – The Licinian law was indeed carried, but soon transgressed and utterly disregarded. Licinius Stolo himself, who had first "agitated" for the law, was punished because he possessed a larger property in land than was allowed, and the patricians opposed the execution of the law with the greatest obstinacy. We must here call especial attention to the distinction which exists between the Roman, the Greek, and our own circumstances. Our civil society rests on other principles, and in it such measures are not necessary. Spartans and Athenians, who had not arrived at such an abstract idea of the State as was so tenaciously held by the Romans, did not trouble themselves with abstract rights, but simply desired that the citizens should have the means of subsistence; and they required of the state that it should take care that such should be the case. This is the chief point

in the first period of Roman History – that the plebs attained the right of being eligible to the higher political offices, and that by a share which they too managed to obtain in the land and soil, the means of subsistence were assured to the citizens.

By this union of the patriciate and the plebs, Rome first attained true internal consistency ; and only after this had been realized could the Roman power develop itself externally. A period of satisfied absorption in the common interest ensues, and the citizens are weary of internal struggles. When after civil discords nations direct their energies outward, they appear in their greatest strength; for the previous excitement continues, and no longer having its object within, seeks for it without. This direction given to the Roman energies was able for a moment to conceal the defect of that union; equilibrium was restored, but without an essential centre of unity and support. The contradiction that existed could not but break out again fearfully at a later period; but previously to this time the greatness of Rome had to display itself in war and the conquest of the world. The power, the wealth, the glory derived from these wars, as also the difficulties to which they led, kept the Romans together as regards the internal affairs of the state. Their courage and discipline secured their victory. As compared with the Greek or Macedonian, the Roman art of war has special peculiarities. The strength of the phalanx lay in its mass and in its massive character. The Roman legions also present a close array, but they had at the same time an articulated organization: they united the two extremes of massiveness on the one hand, and of dispersion into light troops on the other hand: they held firmly together, while at the same time they were capable of ready expansion. Archers and slingers preceded the main body of the Roman army when they attacked the enemy – afterwards leaving the decision to the sword.

It would be a wearisome task to pursue the wars of the Romans in Italy; partly because they are in themselves unimportant – even the often empty rhetoric of the generals in Livy cannot very much increase the interest – partly on account of the unintelligent character of the Roman annalists, in whose pages we see the Romans carrying on war only with “enemies” without learning anything further of their individuality – *e.g.,* the Etruscans, the Samnites, the Ligurians, with whom they carried on wars during many hundred years. – It is singular in regard to these transactions that the Romans, who have the justification conceded by World- History on their side, should also claim for themselves the minor justification in respect to manifestoes and treaties on occasion of minor infringements of them, and maintain it as it were after the fashion of advocates. But in political complications of this kind, either party may take offence at the conduct of the other, if it pleases, and deems it expedient to be offended. – The Romans had long and severe contests to maintain with the Samnites, the Etruscans, the Gauls, the Marsi, the Umbrians and the Bruttii, before they could make themselves masters of the whole of Italy. Their dominion was extended thence in a southerly direction; they gained a secure footing in Sicily, where the Carthaginians had long carried on war; then they extended their power towards the west: from Sardinia and Corsica they went to Spain. They thus soon came into frequent contact with the Carthaginians, and were obliged to form a naval power in opposition to them. This transition was easier in ancient times than it would perhaps be now, when long practice and superior knowledge are required for maritime service. The mode of warfare at sea was not very different from that on land. We have thus reached the end of the first epoch of Roman History, in which the Romans by their retail military transactions had become capitalists in a strength proper to themselves, and with which they were to appear on the theatre of the world. The Roman dominion was, on the whole, not yet very

greatly extended: only a few colonies had settled on the other side of the Po, and on the south a considerable power confronted that of Rome. It was the Second Punic War, therefore, that gave the impulse to its terrible collision with the most powerful states of the time; through it the Romans came into contact with Macedonia, Asia, Syria, and subsequently also with Egypt. Italy and Rome remained the centre of their great far-stretching empire, but this centre was, as already remarked, not the less an artificial, forced, and compulsory one. This grand period of the contact of Rome with other states, and of the manifold complications thence arising, has been depicted by the noble Achaean, Polybius, whose fate it was to observe the fall of his country through the disgraceful passions of the Greeks and the baseness and inexorable persistency of the Romans.

SECTION II: ROME FROM THE SECOND PUNIC WAR TO THE EMPERORS

THE SECOND PERIOD, according to our division, begins with the Second Punic War, that epoch which decided and stamped a character upon Roman dominion. In the first Punic War the Romans had shown that they had become a match for the mighty Carthage, which possessed a great part of the coast of Africa and southern Spain, and had gained a firm footing in Sicily and Sardinia. The second Punic War laid the might of Carthage prostrate in the dust. The proper element of that state was the sea; but it had no original territory, formed no nation, had no national army; its hosts were composed of the troops of subjugated and allied peoples. In spite of this, the great Hannibal with such a host, formed from the most diverse nations, brought Rome near to destruction. Without any support he maintained his position in Italy for sixteen years against Roman patience and perseverance; during which time however the Scipios conquered Spain and entered into alliances with the princes of Africa. Hannibal was at last compelled to hasten to the assistance of his hard-pressed country; he lost the battle of Zatna in the year 552 A.U.C. and after six and thirty years revisited his paternal city, to which he was now obliged to offer pacific counsels. The second Punic War thus eventually established the undisputed power of Rome over Carthage; it occasioned the hostile collision of the Romans with the king of Macedonia, who was conquered five years later. Now Antiochus, the king of Syria, is involved in the melee. He opposed a huge power to the Romans, was beaten at Thermopylae and Magnesia, and was compelled to surrender to the Romans Asia Minor as far as the Taurus. After the conquest of Macedonia both that country and Greece were

declared free by the Romans – a declaration whose meaning we have already investigated, in treating of the preceding Historical nation. It was not till this time that the Third Punic War commenced, for Carthage had once more raised its head and excited the jealousy of the Romans. After long resistance it was taken and laid in ashes. Nor could the Achaean league now long maintain itself in the face of Roman ambition: the Romans were eager for war, destroyed Corinth in the same year as Carthage, and made Greece a province. The fall of Carthage and the subjugation of Greece were the central points from which the Romans gave its vast extent to their sovereignty.

Rome seemed now to have attained perfect security; no external power confronted it: she was the mistress of the Mediterranean – that is of the *media terra* of all civilization. In this period of victory, its morally great and fortunate personages, especially the Scipios, attract our attention. They were morally fortunate – although the greatest of the Scipios met with an end outwardly unfortunate – because they devoted their energies to their country during a period when it enjoyed a sound and unimpaired condition. But after the feeling of patriotism – the dominant instinct of Rome – had been satisfied, destruction immediately invades the state regarded *en masse;* the grandeur of *individual* character becomes stronger in intensity, and more vigorous in the use of means, on account of contrasting circumstances. We see the internal contradiction of Rome now beginning to manifest itself in another form; and the epoch which concludes the second period is also the second mediation of that contradiction. We observed that contradiction previously in the struggle of the patricians against the plebeians: now it assumes the form of private interest, contravening patriotic sentiment; and respect for the state no longer holds these opposites in the necessary equipoise. Rather, we observe now side by side with wars for conquest, plunder and glory, the fearful spectacle of civil discords in Rome, and

intestine wars. There does not follow, as among the Greeks after the Median wars, a period of brilliant splendor in culture, art and science, in which Spirit enjoys inwardly and ideally that which it had previously achieved in the world of action. If inward satisfaction was to follow the period of that external Prosperity in war, the principle of Roman life must be more concrete, But if there were such a concrete life to evolve as an object of consciousness from the depths of their souls by imagination and thought, what would it have been! Their chief spectacles were triumphs, the treasures gained in war, and captives from all nations, unsparingly subjected to the yoke of abstract sovereignty. The concrete element, which the Romans actually find within themselves, is only this unspiritual unity, and any definite thought or feeling of a non-abstract kind, can lie only in the idiosyncrasy of individuals. The tension of virtue is now relaxed, because the danger is past. At the time of the first Punic War, necessity united the hearts of all for the saving of Rome. In the following wars too, with Macedonia, Syria, and the Gauls in Upper Italy, the existence of the entire state was still concerned. But after the danger from Carthage and Macedon was over, the subsequent wars were more and more the mere consequences of victories, and nothing else was needed than to gather in their fruits. The armies were used for particular expeditions, suggested by policy, or for the advantages of individuals – for acquiring wealth, glory, *sovereignty* in the abstract. The relation to other nations was purely that of force. The national individuality of peoples did not, as early as the time of the Romans, excite respect, as is the case in modern times. The various peoples were not yet recognized as legitimated; the various states had not yet acknowledged each other as real essential existences. Equal right to existence entails a union of states, such as exists in modern Europe, or a condition like that of Greece, in which the states had an equal right to existence under the protection of the Delphic god. The Romans do not enter into such a relation to the other

nations, for their god is only the *Jupiter Capitolinus*; neither do they respect the *sacra* of the other nations (any more than the plebeians those of the patricians) ; but as conquerors in the strict sense of the term, they plunder the Palladia of the nations. Rome kept standing armies in the conquered provinces, and proconsuls and propraetors were sent into them as viceroys. The Equites collected the taxes and tributes, which they farmed under the State. A net of such fiscal farmers (*publicani*) was thus drawn over the whole Roman world. – Cato used to say, after every deliberation of the senate: "*Ceterum censeo Carthaginem esse delendam*:" and Cato was a thorough Roman. The Roman principle thereby exhibits itself as the cold abstraction of sovereignty and power, as the pure egotism of the will in opposition to others, involving no moral element of determination, but appearing in a concrete form only in the shape of individual interests. Increase in the number of provinces issued in the aggrandizement of individuals within Rome itself, and the corruption thence arising. From Asia, luxury and debauchery were brought to Rome. Riches flowed in after the fashion of spoils in war, and were not the fruit of industry and honest activity; in the same way as the marine had arisen, not from the necessities of commerce, but with a warlike object. The Roman state, drawing its resources from rapine, came to be rent in sunder by quarrels about dividing the spoil. For the first occasion of the breaking out of contention within it was the legacy of Attalus, King of Pergamus, who had bequeathed his treasures to the Roman State. Tiberius Gracchus came forward with the proposal to divide it among the Roman citizens; he likewise renewed the Licinian Agrarian laws, which had been entirely set aside during the predominance of individuals in the state. His chief object was to procure property for the free citizens, and to people Italy with citizens instead of slaves. This noble Roman, however, was vanquished by the grasping nobles, for the Roman constitution was no longer in a condition to be saved

by the constitution itself. Caius Gracchus, the brother of Tiberius, prosecuted the same noble aim as his brother, and shared the same fate. Ruin now broke in unchecked, and as there existed no generally recognized and absolutely essential object to which the country's energy could be devoted, individualities and physical force were in the ascendant. The enormous corruption of Rome displays itself in the war with Jugurtha, who had gained the senate by bribery, and so indulged himself in the most atrocious deeds of violence and crime. Rome was pervaded by the excitement of the struggle against the Cimbri and Teutones, who assumed a menacing position towards the State. With great exertions the latter were utterly routed in Provence, near Aix; the others in Lombardy at the Adige by Marius the conqueror of Jugurtha. Then the Italian allies, whose demand of Roman citizenship had been refused, raised a revolt; and while the Romans had to sustain a struggle against a vast power in Italy, they received the news that, at the command of Mithridates, 80,000 Romans had been put to death in Asia Minor. Mithridates was King of Pontus, governed Colchis and the lands of the Black Sea, as far as the Tauric peninsula, and could summon to his standard in his war with Rome the populations of the Caucasus, of Armenia, Mesopotamia, and a part of Syria, through his son-in-law Tigranes. Sulla, who had already led the Roman hosts in the Social War, conquered him. Athens, which had hitherto been spared, was beleaguered and taken, but "for the sake of their fathers" – as Sulla expressed himself – not destroyed. He then returned to Rome, reduced the popular faction, headed by Marius and Cinna, became master of the city, and commenced systematic massacres of Roman citizens of consideration. Forty senators and six hundred knights were sacrificed to his ambition and lust of power.

Mithridates was indeed defeated, but not overcome, and was able to begin the war anew. At the same time, Sertorius, a banished Roman, arose

in revolt in Spain, carried on a contest there for eight years, and perished only through treachery. The war against Mithridates was terminated by Pompey; the King of Pontus killed himself when his resources were exhausted. The Servile War in Italy is a contemporaneous event. A great number of gladiators and mountaineers had formed a union under Spartacus, but were vanquished by Crassus. To this confusion was added the universal prevalence of piracy, which Pompey rapidly reduced by a large armament.

We thus see the most terrible and dangerous powers arising against Rome; yet the military force of this state is victorious over all. Great individuals now appear on the stage as during the times of the fall of Greece. The biographies of Plutarch are here also of the deepest interest. It was from the disruption of the state, which had no longer any consistency or firmness in itself, that these colossal individualities arose, instinctively impelled to restore that political unity which was no longer to be found in men's dispositions. It was their misfortune that they could not maintain a pure morality, for their course of action contravened things as they are, and was a series of transgressions. Even the noblest – the Gracchi – were not merely the victims of injustice and violence from without, but were themselves involved in the corruption and wrong that universally prevailed. But that which these individuals purpose and accomplish has on its side the higher sanction of the World-Spirit, and must eventually triumph. The idea of an organization for the vast empire being altogether absent, the senate could not assert the authority of government. The sovereignty was made dependent on the people – that people which was now a mere mob, and was obliged to be supported by corn from the Roman provinces. We should refer to Cicero to see how all affairs of state were decided in riotous fashion, and with arms in hand, by the wealth and power of the grandees on the one side, and by a troop of rabble on the other. The Roman citizens attached

themselves to individuals who flattered them, and who then became prominent in factions, in order to make themselves masters of Rome. Thus we see in Pompey and Caesar the two foci of Rome's splendor coming into hostile opposition: on the one side, Pompey with the Senate, and therefore apparently the defender of the Republic – on the other, Caesar with his legions and a superiority of genius. This contest between the two most powerful individualities could not be decided at Rome in the Forum. Caesar made himself master in succession, of Italy, Spain, and Greece, utterly routed his enemy at Pharsalia, forty-eight years before Christ, made himself sure of Asia, and so returned victor to Rome. In this way the world-wide sovereignty of Rome became the property of a single possessor. This important change must not be regarded as a thing of chance; it was *necessary* – postulated by the circumstances. The democratic constitution could no longer be really maintained in Rome, but only kept up in appearance. Cicero, who had procured himself great respect through his high oratorical talent, and whose learning acquired him considerable influence, always attributes the corrupt state of the republic to individuals and their passions. Plato, whom Cicero professedly followed, had the full consciousness that the Athenian state, as it presented itself to him, could not maintain its existence, and therefore sketched the plan of a perfect constitution accordant with his views. Cicero, on the contrary, does not consider it impossible to preserve the Roman Republic, and only desiderates some temporary assistance for it in its adversity. The nature of the State, and of the Roman State in particular, transcends his comprehension. Cato, too, says of Caesar: "His virtues be execrated, for they have ruined my country!" But it was not the mere accident of Caesar's existence that destroyed the Republic – it was *Necessity*. All the tendencies of the Roman principle were to sovereignty and military force: it contained in it no spiritual centre which it could make the object, occupation, and

enjoyment of its Spirit. The aim of patriotism – that of preserving the State – ceases when the lust of personal dominion becomes the impelling passion. The citizens were alienated from the state, for they found in it no objective satisfaction; and the interests of individuals did not take the same direction as among the Greeks, who could set against the incipient corruption of the practical world, the noblest works of art in painting, sculpture and poetry, and especially a highly cultivated philosophy. Their works of art were only what they had collected from every part of Greece, and therefore not productions of their own; their riches were not the fruit of industry, as was the case in Athens, but the result of plunder. Elegance – Culture – was foreign to the Romans *per se;* they sought to obtain it from the Greeks, and for this purpose a vast number of Greek slaves were brought to Rome. Delos was the centre of this slave trade, and it is said that sometimes on a single day, ten thousand slaves were purchased there. To the Romans, Greek slaves were their poets, their authors, the superintendents of their manufactories, the instructors of their children.

The Republic could not longer exist in Rome. We see, especially from Cicero's writings, how all public affairs were decided by the private authority of the more eminent citizens – by their power, their wealth; and what tumultuary proceedings marked all political transactions. In the republic, therefore, there was no longer any security; *that* could be looked for only in a single will. Caesar, who may be adduced as a paragon of Roman adaptation of means to ends – who formed his resolves with the most unerring perspicuity, and executed them with the greatest vigor and practical skill, without any superfluous excitement of mind – Caesar, judged by the great scope of history, did the Right; since he furnished a mediating element, and that kind of political bond which men's condition required. Caesar effected two objects: he calmed the internal strife, and at the same time originated a new one outside the limits of the empire. For the conquest

of the world had reached hitherto only to the circle of the Alps, but Caesar opened a new scene of achievement: he founded the theatre which was on the point of becoming the centre of History. He then achieved universal sovereignty by a struggle which was decided not in Rome itself, but by his conquest of the whole Roman World.

His position was indeed hostile to the republic, but, properly speaking, only to its shadow; for all that remained of that republic was entirely powerless. Pompey, and all those who were on the side of the senate, exalted their *dignitas auctoritas* – their individual rule – as the power of the republic; and the mediocrity which needed protection took refuge under this title. Caesar put an end to the empty formalism of this title, made himself master, and held together the Roman world by force, in opposition to isolated factions. Spite of this we see the noblest men of Rome supposing Caesar's rule to be a merely adventitious thing, and the entire position of affairs to be dependent on his individuality. So thought Cicero, so Brutus and Cassius. They believed that if this one individual were out of the way, the Republic would be *ipso facto* restored. Possessed by this remarkable hallucination, Brutus, a man of highly noble character, and Cassius, endowed with greater practical energy than Cicero, assassinated the man whose virtues they appreciated. But it became immediately manifest that only a *single* will could guide the Roman State, and now the Romans were compelled to adopt that opinion; since in all periods of the world a political revolution is sanctioned in men's opinions, when it repeats itself. Thus Napoleon was twice defeated, and the Bourbons twice expelled. By repetition that which at first appeared merely a matter of chance and contingency becomes a real and ratified existence.

SECTION III:

CHAPTER I. ROME UNDER THE EMPERORS.

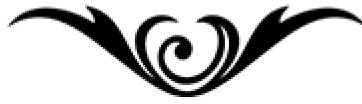
DURING THIS PERIOD the Romans come into contact with the people destined to succeed them as a World-Historical nation; and we have to consider that period in two essential aspects, the *secular* and the *spiritual.* In the secular aspect two leading phases must be specially regarded: first, the position of *the Ruler*; and secondly, the conversion of mere individuals into *persons* – the world of legal relations.

The first thing to be remarked respecting the *imperial rule* is that the Roman government was so abstracted from interest, that the great transition to that rule hardly changed anything in the constitution. The popular assemblies alone were unsuited to the new state of things, and disappeared. The emperor was *princeps senatus,* Censor, Consul, Tribune: he united all their nominally continuing offices in himself; and the military power – here the most essentially important – was exclusively in his hands. The constitution was an utterly unsubstantial form, from which all vitality, consequently all might and power, had departed; and the only means of maintaining its existence were the legions which the Emperor constantly kept in the vicinity of Rome. Public business was indeed brought before the senate, and the Emperor appeared simply as one of its members; but the senate was obliged to obey, and whoever ventured to gainsay his will was punished with death, and his property confiscated. Those therefore who had certain death in anticipation, killed themselves, that if they could do nothing more, they might at least preserve their property to their family. Tiberius was the most odious to the Romans on account of his power of dissimulation: he knew very well how to make good use of the baseness of the senate, in extirpating those among them whom he feared. The power of

the Emperor rested, as we have said, on the army, and the Pretorian bodyguard which surrounded him. But the legions, and especially the Pretorians, soon became conscious of their importance, and arrogated to themselves the disposal of the imperial throne. At first they continued to show some respect for the family of Caesar Augustus, but subsequently the legions chose their own generals; such, viz., as had gained their good will and favor, partly by courage and intelligence, partly also by bribes, and indulgence in the administration of military discipline.

The Emperors conducted themselves in the enjoyment of their power with perfect simplicity, and did not surround themselves with pomp and splendor in Oriental fashion. We find in them traits of simplicity which astonish us. Thus, *e.g.,* Augustus writes a letter to Horace, in which he reproaches him for having failed to address any poem to him, and asks him whether he thinks that that would disgrace him with posterity. Sometimes the Senate made an attempt to regain its consequence by nominating the Emperor: but their nominees were either unable to maintain their ground, or could do so only by bribing the Pretorians. The choice of the senators and the constitution of the senate was moreover left entirely to the caprice of the Emperor. The political institutions were united in the person a the Emperor; no moral bond any longer existed; the will of the Emperor was supreme, and before him there was absolute equality. The freedmen who surrounded the Emperor were often the mightiest in the empire; for caprice recognizes no distinction. In the person of the Emperor isolated subjectivity has gained a perfectly unlimited realization. Spirit has renounced its proper nature, inasmuch as Limitation of being and of volition has been constituted an unlimited absolute existence. This arbitrary choice, moreover, has only one limit, the limit of all that is human – *death*; and even death became a theatrical display. Nero, *e.g.,* died a death, which may furnish an example for the noblest hero, as for the most resigned of sufferers. Individual

subjectivity thus entirely emancipated from control, has no inward life, no prospective nor retrospective emotions, no repentance, nor hope, nor fear – not even thought; for all these involve fixed conditions and aims, while here every condition is purely contingent. The springs of action are none other than desire, lust, passion, fancy – in short, caprice absolutely unfettered. It finds so little limitation in the will of others, that the relation of will to will may be called that of absolute sovereignty to absolute slavery. In the whole known world, no will is imagined that is not subject to the will of the Emperor. But under the sovereignty of that One, everything is in a condition of *order*; for as it actually *is* [as the Emperor has willed it], it is in due order, and government consists in bringing all into harmony with the sovereign *One.* The concrete element in the character of the Emperors is therefore of itself of no interest, because the concrete is not of essential importance. Thus there were Emperors of noble character and noble nature, and who highly distinguished themselves by mental and moral culture. Titus, Trajan, the Antonines, are known as such characters, rigorously strict in self-government; yet even these produced no change in the state. The proposition was never made during their time, to give the Roman Empire an organization of free social relationship: they were only a kind of happy chance, which passes over without a trace, and leaves the condition of things as it was. For these persons find themselves here in a position in which they cannot be said to act, since no object confronts them in opposition; they have only to will – well or ill – and it *is* so. The praiseworthy emperors Vespasian and Titus were succeeded by that coarsest and most loathsome tyrant, Domitian: yet the Roman historian tells us that the Roman world enjoyed tranquillizing repose under him. Those single points of light, therefore, effected no change; the whole empire was subject to the pressure of taxation and plunder; Italy was depopulated; the most



fertile lands remained untilled: and this state of things lay as a fate on the Roman world.

The second point which we have particularly to remark, is the position taken by individuals as *persons*. Individuals were perfectly equal (slavery made only a trifling distinction), and without any political right. As early as the termination of the Social War, the inhabitants of the whole of Italy were put on an equal footing with Roman citizens; and under Caracalla all distinction between the subjects of the entire Roman empire was abolished. Private Right developed and perfected this equality. The right of property had been previously limited by distinctions of various kinds, which were now abrogated. We observed the Romans proceeding from the principle of abstract Subjectivity, which now realizes itself as Personality in the recognition of Private Right. Private Right, viz., is this, that the social unit as such enjoys consideration in the state, in the reality which he gives to himself – viz., in property. The living political body – that Roman feeling which animated it as its soul – is now brought back to the isolation of a lifeless Private Right. As, when the physical body suffers dissolution, each point gains a life of its own, but which is only the miserable life of worms; so the political organism is here dissolved into atoms – viz., private persons. Such a condition *is* Roman life at this epoch: on the one side, Fate and the abstract universality of sovereignty; on the other, the *individual* abstraction. "Person," which involves the recognition of the independent dignity of the social unit – not on the ground of the display of the life which he possesses – in his complete individuality – but as the abstract *individuum*. It is the pride of the social units to enjoy absolute importance as private persons; for the Ego is thus enabled to assert unbounded claims; but the substantial interest thus comprehended – the *meum* – is only of a superficial kind, and the development of private right, which this high principle introduced, involved the decay of political life. – The Emperor *domineered* only, and

could not be said to *rule;* for the equitable and moral medium between the sovereign and the subjects was wanting – the bond of a constitution and organization of the state, in which a gradation of circles of social life, enjoying independent recognition, exists in communities and provinces, which, devoting their energies to the general interest, exert an influence on the general government. There are indeed Curiae in the towns, but they are either destitute of weight, or used only as means for oppressing individuals, and for systematic plunder. That, therefore, which was abidingly present to the minds of men was not their country, or such a moral unity as that supplies: the whole state of things urged them to yield themselves to fate, and to strive for a perfect indifference to life – an indifference which they sought either in freedom of thought or in directly sensuous enjoyment. Thus man was either at war with existence, or entirely given up to mere sensuous existence. He either recognized his destiny in the task of acquiring the means of enjoyment through the favor of the Emperor, or through violence, testamentary frauds, and cunning; or he sought repose in philosophy, which alone was still able to supply something firm and independent: for the systems of that time – Stoicism, Epicureanism, and Scepticism – although within their common sphere opposed to each other, had the same general purport, viz., rendering the soul absolutely indifferent to everything which the real world had to offer. These philosophies were therefore widely extended among the cultivated: they produced in man a selfreliant immobility as the result of Thought, *i.e.,* of the activity which produces the Universal. But the inward reconciliation by means of philosophy was itself only an abstract one – in the pure principle of personality; for Thought, which, as perfectly refined, made itself its own object, and thus harmonized itself, was entirely destitute of a real object, and the immobility of Scepticism made aimlessness itself the object of the Will. This philosophy knew nothing but the negativity of all that assumed to be real, and was the

counsel of despair to a world which no longer possessed anything stable. It could not satisfy the living Spirit, which longed after a higher reconciliation,

CHAPTER II. CHRISTIANITY.

IT HAS BEEN remarked that Caesar inaugurated the Modern World on the side of *reality,* while its spiritual and inward existence was unfolded under Augustus. At the beginning of that empire, whose principle we have recognized as finiteness and particular subjectivity exaggerated to infinitude, the salvation of the World had its birth in the same principle of subjectivity – viz., as a *particular person,* in abstract subjectivity, but in such a way that conversely, finiteness is only the *form* of his appearance, while infinity and absolutely independent existence constitute the essence and substantial being which it embodies. The Roman World, as it has been described – in its desperate condition and the pain of abandonment by God – came to an open rupture with reality, and made prominent the general desire for a satisfaction such as can only be attained in "the inner man," the Soul – thus preparing the ground for a higher Spiritual World. Rome was the Fate that crushed down the gods and all genial life in its hard service, while it was the power that purified the human heart from all speciality. Its entire condition is therefore analogous to a place of birth, and its pain is like the travail-throes of another and higher Spirit, which manifested itself in connection with the *Christian Religion.* This higher Spirit involves the reconciliation and emancipation of Spirit; while man obtains the consciousness of Spirit in its universality and infinity. The Absolute Object, *Truth,* is Spirit; and as man himself is Spirit, he is present [is mirrored] to himself in that object, and thus in his Absolute Object has found Essential Being and *his own* essential being. But in order that the objectivity of Essential Being may be done away with, and Spirit be no longer alien to itself – may be *with* itself [self- harmonized] – the Naturalness of Spirit –

that in virtue of which man is a special, empirical existence – must be removed; so that the alien element may be destroyed, and the reconciliation of Spirit be accomplished.

God is thus recognized as *Spirit,* only when known as the Triune. This new principle is the axis on which the History of the World turns. This is *the goal* and the *starting point* of History. "When the fulness of the time was come, God sent his Son," is the statement of the Bible. This means nothing else than that *self-consciousness* had reached the phases of development [*Momente*], whose resultant constitutes the Idea of Spirit, and had come to feel the necessity of comprehending those phases absolutely. This must now be more fully explained. We said of the Greeks, that the law for their Spirit was: "Man, know thyself." The Greek Spirit was a consciousness of Spirit, but under a limited form, having the element of Nature as an essential ingredient. Spirit may have had the upper hand, but the unity of the superior and the subordinate was itself still Natural. Spirit appeared as specialized in the idiosyncrasies of the genius of the several Greek nationalities and of their divinities, and was represented by *Art,* in whose sphere the Sensuous is elevated only to the middle ground of beautiful form and shape, but not to pure Thought. The element of Subjectivity that was wanting to the Greeks, we found among the Romans: but as it was merely formal and in itself indefinite, it took its material from passion and caprice; – even the most shameful degradations could be here connected with a divine dread (*vide* the declaration of Hispala respecting the Bacchanalia, Livy xxxix. 13). This element of subjectivity 's afterwards further realized as Personality of Individuals – a realization which is exactly adequate to the principle, and is equally abstract and formal. As such an Ego [such a personality], I am infinite to myself, and my phenomenal existence consists in the property recognized as mine, and the recognition of my personality. This inner existence goes no further; all the applications of

the principle merge in this. Individuals are thereby posited as atoms; but they are at the same time subject to the severe rule of the *One,* which as *monas monadum* is a power over private persons [the connection between the ruler and the ruled is not mediated by the claim of Divine or of Constitutional Right, or any general principle, but is direct and individual, the Emperor being the immediate lord of each subject in the Empire]. That Private Right is therefore, *ipso facto,* a nullity, an ignoring of the personality; and the supposed condition of Right turns out to be an absolute destitution of it. This contradiction is the misery of the Roman World. Each person is, according to the principle of his personality, entitled only to possesion, while the Person of Persons lays claim to the possession of all these individuals, so that the right assumed by the social unit is at once abrogated and robbed of validity. But the misery of this contradiction is the *Discipline of the World.* "Zucht" (discipline) is derived from "Ziehen" (to draw). This "drawing" must be towards something; there must be some fixed unity in the background in whose direction that drawing takes place, and for which the subject of it is being trained, in order that the standard of attainment may be reached. A renunciation, a disaccustoming, is the means of leading to an absolute basis of existence. That contradiction which afflicts the Roman World is the very state of things which constitutes such a discipline – the discipline of that culture which compels personality to display its nothingness. But it is reserved for us of a later period to regard this as a training; to those who are thus trained [*traines,* dragged], it seems a blind destiny, to which they submit in the stupor of suffering. The higher condition, in which the soul itself feels pain and longing – in which man is not only "drawn," but feels that the drawing is into himself [into his own inmost nature] – is still absent. What has been reflection on our part must arise in the mind of the subject of this discipline in the form of a consciousness that in himself he is miserable and null. Outward suffering

must, as already said, be merged in a sorrow of the inner man. He must feel himself as the negation of himself; he must see that his misery is the misery of his nature – that he is in himself a divided and discordant being. This state of mind, this self-chastening, this pain occasioned by our individual nothingness – the wretchedness of our [isolated] self, and the longing to transcend this condition of soul – must be looked for elsewhere than in the properly Roman World. It is this which gives to the *Jewish People* their World-Historical importance and weight; for from this state of mind arose that higher phase in which Spirit came to absolute self-consciousness – passing from that alien form of being which is its discord and pain, and mirroring itself in its own essence. The state of feeling in question we find expressed most purely and beautifully in the Psalms of David, and in the Prophets; the chief burden of whose utterances is the thirst of the soul after God, its profound sorrow for its transgressions, and the desire for righteousness and holiness. Of this Spirit we have the mythical representation at the very beginning of the Jewish canonical books, in the account of the Fall. Man, created in the image of God, lost, it is said, his state of absolute contentment, by eating of the Tree of the Knowledge of Good and Evil. Sin consists here only in Knowledge: this is the sinful element, and by it man is stated to have trifled away his Natural happiness. This is a deep truth, that evil lies in consciousness: for the brutes are neither evil nor good; the merely Natural Man quite as little. Consciousness occasions the separation of the Ego, in its boundless freedom as arbitrary choice, from the pure essence of the Will – *i.e.,* from the Good. Knowledge, as the disannulling of the unity of mere Nature, is the "Fall," which is no casual conception, but the eternal history of Spirit. For the state of innocence, the paradisaical condition, is that of the brute. Paradise is a park, where only brutes, not men, can remain. For the brute is one with God only implicitly [not consciously]. Only Man's Spirit (that is) has a self-cognizant

existence. This existence for self, this consciousness, is at the same time separation from the Universal and Divine Spirit. If I hold to my abstract Freedom, in contraposition to the Good, I adopt the standpoint of Evil. The Fall is therefore the eternal Mythus of Man – in fact, the very transition by which he becomes man. Persistence in this standpoint is, however, Evil, and the feeling of pain at such a condition, and of longing to transcend it, we find in David, when he says: "Lord, create for me a pure heart, a new *steadfast* Spirit." This feeling we observe even in the account of the Fall; though an announcement of Reconciliation is not made there, but rather one of continuance in misery. Yet we have in this narrative the *prediction* of reconciliation in the sentence, "The serpent's head shall be bruised"; but still more profoundly expressed where it is stated that when God saw that Adam had eaten of that tree, he said, "Behold Adam is become as one of us, knowing Good and Evil." God confirms the words of the Serpent. Implicitly and explicitly, then, we have the truth, that man through Spirit – through cognition of the Universal and the Particular – comprehends God Himself. But it is only God that declares this – not man: the latter remains, on the contrary, in a state of internal discord. The joy of reconciliation is still distant from humanity; the absolute and final repose of his whole being is not yet discovered to man. It exists, in the first instance, only for God. As far as the present is concerned, the feeling of pain at his condition is regarded as a final award. The satisfaction which man enjoys at first, consists in the finite and temporal blessings conferred on the Chosen Family and the possession of the Land of Canaan. His repose is not found in God. Sacrifices are, it is true, offered to Him in the Temple, and atonement made by outward offerings and inward penitence. But that mundane satisfaction in the Chosen Family, and its possession of Canaan, was taken from the Jewish people in the chastisement inflicted by the Roman Empire. The Syrian kings did indeed oppress it, but it was left for the Romans to

annul its individuality. The Temple of Zion is destroyed; the God-serving nation is scattered to the winds. Here every source of satisfaction is taken away, and the nation is driven back to the standpoint of that primeval mythus – the standpoint of that painful feeling which humanity experiences when thrown upon itself. Opposed to the universal *Fatum* of the Roman World, we have here the consciousness of Evil and the direction of the mind Godwards. All that remains to be done, is that this fundamental idea should be expanded to an objective universal sense, and be taken as the concrete existence of man – as the completion of his nature. Formerly the Land of Canaan and themselves as the people of God had been regarded by the Jews as that concrete and complete existence. But this basis of satisfaction is now lost, and thence arises the sense of misery and failure of hope in God, with whom that happy reality had been essentially connected. Here, then, misery is not the stupid immersion in a blind Fate, but a boundless energy of longing. Stoicism taught only that the Negative *is not* – that pain must not be recognized as a veritable existence; but *Jewish* feeling persists in acknowledging Reality and desires harmony and reconciliation within its sphere; for that feeling is based on the Oriental Unity of Nature – *i.e.,* the unity of Reality, of Subjectivity, with the substance of the One Essential Being. Through the loss of mere outward reality Spirit is driven back within itself; the side of reality is thus refined to Universality, through the reference of it to the One. The Oriental antithesis of Light and Darkness is transferred to Spirit, and the Darkness becomes Sin. For the abnegation of reality there is no compensation but Subjectivity itself – the Human Will as intrinsically universal; and thereby alone does reconciliation become possible. Sin is the discerning of Good and Evil as separation; but this discerning likewise heals the ancient hurt, and is the fountain of infinite reconciliation. The discerning in question brings with it the destruction of that which is external and alien in consciousness, and is consequently the

return of Subjectivity into itself. This, then, adopted into the actual self-consciousness of the World is the *Reconciliation* [atonement] *of the World.* From that unrest of infinite sorrow – in which the two sides of the antithesis stand related to each other – is developed the unity of God with Reality (which latter had been posited as negative *i.e.,* with Subjectivity which had been separated from Him. The infinite loss is counterbalanced only by its infinity, and thereby becomes infinite gain. The recognition of the identity of the Subject and God was introduced into the World when *the fulness of Time was come*: the consciousness of this identity is the recognition of God in his true essence. The material of Truth is *Spirit* itself – inherent vital movement. The nature of God as pure Spirit, is manifested to man *in the Christian Religion.*

But what is Spirit? It is the one immutably homogeneous infinite – pure Identity – which in its second phase separates itself from itself and makes this second aspect Its own polar opposite, viz. as existence for and in self as contrasted with the Universal. But this separation is annulled by the fact that atomistic Subjectivity, as simple relation to itself [as occupied with self alone] is itself the Universal, the Identical with self. If Spirit be defined as absolute reflection within itself in virtue of its absolute duality – Love on the one hand as comprehending the Emotional [*Empfindung*], Knowledge on the other hand as Spirit [including the penetrative and active faculties, as opposed to the receptive] – it is recognized as *Triune:* the "Father" and the "Son," and that duality which essentially characterizes it as "Spirit." It must further be observed, that *in* this truth, the relation of man *to* this truth is also posited. For Spirit makes itself its own [polar] opposite – and is the return from this opposite into itself. Comprehended in pure ideality, that antithetic form of Spirit is the Son of God; reduced to limited and particular conceptions, it is the World-Nature and Finite Spirit: Finite Spirit itself therefore is posited as a constituent element [Moment] in the Divine Being.

Man himself therefore is comprehended in the Idea of God, and this comprehension may be thus expressed – that the unity of Man with God is posited in the Christian Religion. But this unity must not be superficially conceived, as if God were only Man, and Man, without further condition, were God. Man, on the contrary, is God only in so far as he annuls the merely Natural and Limited in his Spirit and elevates himself to God. That is to say, it is obligatory on him who is a partaker of the truth, and knows that he himself is a constituent [Moment] of the Divine Idea, to give up his merely natural being: for the Natural is the Unspiritual. In this Idea of God, then, is to be found also the *Reconciliation* that heals the pain and inward suffering of man. For Suffering itself is henceforth recognized as an instrument necessary for producing the unity of man with God. This implicit unity exists in the first place only for the thinking speculative consciousness; but it must also exist for the sensuous, representative consciousness – it must become an object for the World – it must *appear,* and that in the sensuous form appropriate to Spirit, which is the human. *Christ has appeared* – a Man who is God – God who is Man; and thereby peace and reconciliation have accrued to the World. Our thoughts naturally revert to the Greek anthropomorphism, of which we affirmed that it did not go far enough. For that natural elation of soul which characterized the Greeks did not rise to the Subjective Freedom of the Ego itself – to the inwardness that belongs to the Christian Religion – to the recognition of Spirit as a *definite positive being.* – The appearance of the Christian God involves further its being *unique* in its kind; it can occur only once, for God is realized as Subject, and as manifested Subjectivity is exclusively One Individual. The Lamas are ever and anon chosen anew; because God is known in the East as Substance, whose infinity of form is recognized merely in an unlimited multeity of outward and particular manifestations. But subjectivity as infinite relation to self, has its form *in itself,* and as

manifested, must be a unity excluding all others. – Moreover the sensuous existence in which Spirit is embodied is only a transitional phase. Christ dies; only as dead, is he exalted to Heaven and sits at the right hand of God; only thus is he Spirit. He himself says: "When I am no longer with you, the Spirit will guide you into all truth." Not till the Feast of Pentecost were the Apostles filled with the Holy Ghost. To the Apostles, Christ as living, was not that which he was to them subsequently as the Spirit of the Church, in which he became to them for the first time an object for their truly spiritual consciousness. On the same principle, we do not adopt the right point of view in thinking of Christ only as a historical bygone personality. So regarded, the question is asked, What are we to make of his birth, his Father and Mother, his early domestic relations, his miracles, etc.? – *i.e.,* What is he *unspiritually* regarded? Considered only in respect of his talents, character and morality – as a Teacher and so forth – we place him in the same category with Socrates and others, though his morality may be ranked higher. But excellence of character, morality, etc. – all this is not the *ne plus ultra* in the requirements of Spirit – does not enable man to gain the speculative idea of Spirit for his conceptive faculty. If Christ is to be looked upon only as an excellent, even impeccable individual, and nothing more, the conception of the Speculative Idea, of Absolute Truth is ignored. But this is the desideratum, the point from which we have to start. Make of Christ what you will, exegetically, critically, historically – demonstrate as you please, how the doctrines of the Church were and said, Behold my mother and my brethren! For he that doeth the will of my Father in heaven, the same is my brother, and sister and mother." Yes, it is even said: "*Think not that I am come to send peace on the Earth. I am not come to send peace but the sword. For I am come to set a man against his father, and the daughter against her mother, and the mother-in-law against her daughter-in-law*." Here then is an abstraction from all that belongs to reality, even

from moral ties. We may say that nowhere are to be found such revolutionary utterances as in the Gospels; for everything that had been respected, is treated as a matter of indifference – as worthy of no regard.

The next point is the development of this principle; and the whole sequel of History is the history of its development. Its first realization is the formation by the friends of Christ, of a Society – a Church. It has been already remarked that only after the death of Christ could the Spirit come upon his friends; that only then were they able to conceive the true idea of God, viz., that in Christ man is redeemed and reconciled: for in him the idea of eternal truth is recognized, the essence of man acknowledged to be Spirit, and the fact proclaimed that only by stripping himself of his finiteness and surrendering himself to pure self-consciousness, does he attain the truth. Christ – man as man – in whom the unity of God and man has appeared, has in his death, and his history generally, himself presented the eternal history of Spirit – a history which every man has to accomplish in himself, in order to exist as Spirit, or to become a child of God, a citizen of his kingdom. The followers of Christ, who combine on this principle and live in the spiritual life as their aim, form the *Church,* which is the Kingdom of God. “Where two or three are gathered together in my name” (*i.e.*, “in the character of partakers in my being”) says Christ, “there am I in the midst of them.” The Church is a real present life in the Spirit of Christ.

It is important that the Christian religion be not limited to the teachings of Christ himself: it is in the Apostles that the completed and developed truth is first exhibited. This complex of thought unfolded itself in the Christian community. That community, in its first experiences, found itself sustaining a double relation – first, a relation to the Roman World, and secondly, to the truth whose development was its aim. We will pursue these different relations separately. The Christian community found itself in the Roman world, and in this world the extension of the Christian religion was

to take place. That community must therefore keep itself removed from all activity in the State – constitute itself a separate company, and not react against the decrees, views, and transactions of the state. But as it was secluded from the state, and consequently did not hold the Emperor for its absolute sovereign, it was the object of persecution and hate. Then was manifested that infinite inward liberty which it enjoyed, in the great steadfastness with which sufferings and sorrows were patiently borne for the sake of the highest truth. It was less the miracles of the Apostles that gave to Christianity its outward extension and inward strength, than the substance, the truth of the doctrine itself. Christ himself says: "Many will say to me at that day: Lord, Lord! have we not prophesied in thy name, have we not cast out devils in thy name, have we not in thy name done many wonderful deeds? Then will I profess unto them: I never knew you, depart from me all ye workers of iniquity."

As regards its other relation, viz., that to the Truth, it is especially important to remark that the *Dogma* – the Theoretical – was already matured within the Roman World, while we find the development of the State from that principle, a much later growth. The Fathers of the Church and the Councils constituted the dogma; but a chief element in this constitution was supplied by the previous development of *philosophy.* Let us examine more closely how the philosophy of the time stood related to religion. It has already been remarked that the Roman inwardness and subjectivity, which presented itself only abstractly, as soulless personality in the exclusive position assumed by the Ego, was refined by the philosophy of Stoicism and Scepticism to the form of Universality. The ground of Thought was thereby reached, and God was known in Thought as the One Infinite. The Universal stands here only as an unimportant predicate – not itself a Subject, but requiring a concrete particular application to make it such. But the One and Universal, the Illimitable conceived by fancy, is

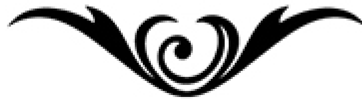
essentially Oriental; for measureless conceptions, carrying all limited existence beyond its .proper bounds, are indigenous to the East. Presented in the domain of Thought itself, the Oriental *One* is the invisible and non-sensuous God of the Israelitish people, but whom they also make an object of conception as a person. This principle became World-Historical with Christianity. – In the Roman World, the union of the East and West had taken place in the first instance by means of conquest: it took place now inwardly, psychologically, also; – the Spirit of the East spreading over the West. The worship of Isis and that of Mithra had been extended through the whole Roman World; Spirit, lost in the outward and in limited aims, yearned after an Infinite. But the West desired a deeper, purely inward Universality – an Infinite possessed at the same time of positive qualities. Again, it was in Egypt – in Alexandria, viz., the centre of communication between the East and the West – that the problem of the age was proposed for Thought; and the solution now found was – Spirit. There the two principles came into scientific contact, and were scientifically worked out. It is especially remarkable to observe there, learned Jews such as Philo, connecting abstract forms of the concrete, which they derived from Plato and Aristotle, with their conception of the Infinite, and recognizing God according to the more concrete idea of Spirit, under the definition of the Logos. So, also, did the profound thinkers of Alexandria comprehend the unity of the Platonic and Aristotelian Philosophy; and their speculative thinking attained those abstract ideas which are likewise the fundamental purport of the Christian religion. The application, by way of postulate, to the pagan religion, of ideas recognized as true, was a direction which philosophy had already taken among the heathen. Plato had altogether repudiated the current mythology, and, with his followers, was accused of Atheism. The Alexandrians, on the contrary, endeavored to demonstrate a speculative truth in the Greek conceptions of the gods: and the Emperor

Julian the Apostate resumed the attempt, asserting that the pagan ceremonials had a strict connection with rationality. The heathen felt, as it were, obliged to give to their divinities the semblance of something higher than sensuous conceptions; they therefore attempted to spiritualize them. Thus much is also certain, that the Greek religion contains a degree of Reason; for the substance of Spirit is Reason, and its product must be something Rational. It makes a difference, however, whether Reason is explicitly developed in Religion, or merely adumbrated by it, as constituting its hidden basis. And while the Greeks thus spiritualized their sensuous divinities, the Christians also, on their side, sought for a profounder sense in the historical part of their religion. Just as Philo found a deeper import shadowed forth in the Mosaic record, and idealized what he considered the bare shell of the narrative, so also did the Christians treat their records – partly with a polemic view, but still more largely from a free and spontaneous interest in the process. But the instrumentality of philosophy in introducing these dogmas into the Christian Religion, is no sufficient ground for asserting that they were foreign to Christianity and had nothing to do with it. It is a matter of perfect indifference where a thing originated; the only question is: "Is it true in and for itself?" Many think that by pronouncing the doctrine to be Neo- Platonic, they have *ipso facto* banished it from Christianity. Whether a Christian doctrine stands exactly thus or thus in the Bible – the point to which the exegetical scholars of modern times devote all their attention – is not the only question. The Letter kills, the Spirit makes alive: this they say themselves, yet pervert the sentiment by taking the *Understanding* for the *Spirit.* It was the Church that recognized and established the doctrines in question – *i.e.* the Spirit of the Church; and it is itself an Article of Doctrine: "I believe in a Holy Church;" as Christ himself also said: "The Spirit will guide you into all truth." In the Nicene Council (A.D. 325), was ultimately established a fixed confession of faith,

to which we still adhere: this confession had not, indeed, a speculative *form,* but the profoundly speculative is most intimately inwoven with the manifestation of Christ himself. Even in John (en arch hn o logos, ka o logos hn pros ton qewn un o logos) we see the commencement of a profounder comprehension. The profoundest thought is connected with the personality of Christ – with the historical and external; and it is the very grandeur of the Christian religion that, with all this profundity, it is easy of comprehension by our consciousness in its outward aspect, while, at the same time, it summons us to penetrate deeper. It is thus adapted to every grade of culture, and yet satisfies the highest requirements.

Having spoken of the relation of the Christian community to the Roman world on the one side, and to the truth contained in its doctrines on the other side, we come to the third point – in which both doctrine and the external world are concerned – the *Church.* The Christian community is the Kingdom of Christ – its influencing present Spirit being Christ: for this kingdom has an actual existence, not a merely future one. This spiritual actuality has, therefore, also a phenomenal existence; and that, not only as contrasted with heathenism, but with secular existence generally. For the Church, as presenting this outward existence, is not merely a *religion* as opposed to another religion, but is at the same time a particular form of secular existence, occupying a place side by side with other secular existence. The religious existence of the Church is governed by Christ; the secular side of its government is left to the free choice of the members themselves. Into this kingdom of God an organization must be introduced. In the first instance, all the members know themselves filled with the Spirit; the whole community perceives the truth and gives expression to it; yet, together with this common participation of spiritual influence, arises the necessity of a presidency of guidance and teaching – a body distinct from the community at large. Those are chosen as presidents who are

distinguished for talents, character, fervor of piety, a holy life, learning, and culture generally. The presidents – those who have a superior acquaintance with that substantial Life of which all are partakers, and who are instructors in that Life – those who establish what is truth, and those who dispense its enjoyment – are distinguished from the community at large, as persons endowed with knowledge and governing power are from the governed. To the intelligent presiding body, the Spirit comes in a fully revealed and *explicit* form; in the mass of the community that Spirit is only *implicit.* While, therefore, in the presiding body, the Spirit exists as self-appreciating and self-cognizant, it becomes an authority in spiritual as well as in secular matters – an authority for the truth and for the relation of each individual to the truth, determining how he should conduct himself so as to act in accordance with the Truth. This distinction occasions the rise of an *Ecclesiastical Kingdom* in the Kingdom of God. Such a distinction is inevitable ; but the existence of an authoritative government for the Spiritual, when closely examined, shows that human subjectivity in its proper form has not yet developed itself. In the heart, indeed, the evil will is surrendered, but the will, as human, is not yet interpenetrated by the Deity; the human will is emancipated only abstractly – not in its concrete reality – for the whole sequel of History is occupied with the realization of this concrete Freedom. Up to this point, finite Freedom has been only annulled, to make way for infinite Freedom. The latter has not yet penetrated secular existence with its rays. Subjective Freedom has not yet attained validity as such: Insight [speculative conviction] does not yet rest on a basis of its own, but is content to inhere in the spirit of an extrinsic authority. That *Spiritual* [*geistig*] kingdom has, therefore, assumed the shape of an *Ecclesiastical* [*geistlich*] one, as the relation of the substantial being and essence of Spirit to human Freedom. Besides the interior organization already mentioned, we find the Christian community assuming also a definite external position,



and becoming the possessor of property of its own. As property belonging to the spiritual world, it is presumed to enjoy special protection; and the immediate inference from this is, that the Church has no dues to pay to the state, and that ecclesiastical persons are not amenable to the jurisdiction of the secular courts. This entails the government by the Church itself of ecclesiastical property and ecclesiastical persons. Thus there originates with the Church the contrasted spectacle of a body consisting only of private persons and the power of the Emperor on the secular side; – on the other side, the perfect democracy of the spiritual community, choosing its own president. Priestly consecration, however, soon changes this democracy into aristocracy; – though the further development of the Church does not belong to the period now under consideration, but must be referred to the world of a later date. It was then through the Christian Religion that the Absolute Idea of God, in its true conception, attained consciousness. Here Man, too, finds himself comprehended in his true nature, given in the specific conception of "the Son." Man, finite when regarded *for himself,* is yet at the same time the Image of God and a fountain of infinity *in himself.* He is the object of his own existence – has in himself an infinite value, an eternal destiny. Consequently he has his true home in a super-sensuous world – an infinite subjectivity, gained only by a rupture with mere Natural existence and volition, and by his labor to break their power within him. This is religious self- consciousness. But in order to enter the sphere and display the active vitality of that religious life, humanity must become capable of it. This capability is the dunamis for that energeia. What therefore remains to be considered is, those conditions of humanity which are the necessary corollary to the consideration that Man is Absolute Self-consciousness – his Spiritual nature being the starting-point and presupposition. These conditions are themselves not yet of a concrete order, but simply the first *abstract principles,* which are won by the

instrumentality of the Christian Religion for the *secular State.* First, under Christianity Slavery is impossible; for man is man – in the abstract essence of his nature – is contemplated in God; each unit of mankind is an object of the grace of God and of the Divine purpose: "God will have *all* men to be saved." Utterly excluding all speciality, therefore, man, in and for himself – in his simple quality of man – has infinite value; and this infinite value abolishes, *ipso facto,* all particularity attaching to birth or country. The other, the second principle, regards the subjectivity of man in its bearing on the Fortuitous – on Chance. Humanity has this sphere of free Spirituality in and for itself, and everything else must proceed from it. The place appropriated to the abode and presence of the Divine Spirit – the sphere in question – is Spiritual Subjectivity, and is constituted the place to which all contingency is amenable. It follows thence, that what we observed among the Greeks as a form of Customary Morality, cannot maintain its position in the Christian world. For *that* morality is spontaneous unreflected Wont; while the Christian principle is independent subjectivity – the soil on which grows the True. Now an unreflected morality cannot continue to hold its ground against the principle of Subjective Freedom. Greek Freedom was that of Hap and "Genius"; it was still conditioned by Slaves and Oracles; but now the principle of absolute Freedom in God makes its appearance. Man now no longer sustains the relation of Dependence, but of Love – in the consciousness that he is a partaker in the Divine existence. In regard to particular aims [such as the Greeks referred to oracular decision], man now forms his own determinations and recognizes himself as plenipotentiary in regard to all finite existence. All that is special retreats into the background before that Spiritual sphere of subjectivity, which takes a secondary position only in presence of the Divine Spirit. The superstition of oracles and auspices is thereby entirely abrogated: Man is recognized as the absolute authority in crises of decision.

It is the two principles just treated of, that now attach to Spirit in this its self-contained phase. The inner shrine of man is designed, on the one hand, to train the citizen of the religious life to bring himself into harmony with the Spirit of God; on the other hand, this is the *point du départ* for determining secular relations, and its condition is the theme of Christian History. The change which piety effects must not remain concealed in the recesses of the heart, but must become an actual, present world, complying with the conditions prescribed by that Absolute Spirit. Piety of heart does not, *per se,* involve the submission of the subjective will, in its external relations, to that piety. On the contrary we see all passions increasingly rampant in the sphere of reality, because that sphere is looked down upon with contempt, from the lofty position attained by the world of mind, as one destitute of all claim and value. The problem to be solved is therefore the imbuing of the sphere of [ordinary] unreflected Spiritual existence, with the *Idea* of Spirit. A general observation here suggests itself. From time immemorial it has been customary to assume an opposition between Reason and Religion, as also between *Religion and the World;* but on investigation this turns out to be only a *distinction.* Reason in general is the Positive Existence [*Wesen*] of Spirit, divine as well as human. The distinction between Religion and the World is only this – that Religion as such, is Reason in the soul and heart – that it is a temple in which Truth and Freedom in God are presented to the conceptive faculty: the State, on the other hand, regulated by the selfsame Reason, is a temple of Human Freedom concerned with the perception and volition of a reality, whose purport may itself be called divine. Thus Freedom in the State is preserved and established by Religion, since moral rectitude in the State is only the carrying out of that which constitutes the fundamental principle of Religion. The process displayed in History is only the manifestation of Religion as Human Reason – the production of the religious principle which dwells in

the heart of man, under the form of Secular Freedom. Thus the discord between the inner life of the heart and the actual world is removed. To realize this is, however, the vocation of another people – or other peoples – viz., the *German.* In ancient Rome itself, Christianity cannot find a ground on which it may become actual, and develop an empire.

CHAPTER III. THE BYZANTINE EMPIRE.

WITH CONSTANTINE THE Great the Christian religion ascended the throne of the empire. He was followed by a succession of Christian Emperors, interrupted only by Julian – who however, could do but little for the prostrate ancient faith. The Roman Empire embraced the whole civilized earth, from the Western Ocean to the Tigris – from the interior of Africa, to the Danube (Pannonia, Dacia). Christianity soon spread through the length and breadth of this enormous realm. Rome had long ceased to be the exclusive residence of the Emperors. Many of Constantine's predecessors had resided in Milan or other places; and he himself established a second court in the ancient Byzantium, which received the name of Constantinople. From the first its population consisted chiefly of Christians, and Constantine lavished every appliance to render this new abode equal in splendor to the old. The empire still remained in its integrity till Theodosius the Great made permanent a separation that had been only occasional, and divided it between his two sons. The reign of Theodosius displayed the last faint glimmer of that splendor which had glorified the Roman world. Under him the pagan temples were shut, the sacrifices and ceremonies abolished, and paganism itself forbidden: gradually however it entirely vanished of itself. The heathen orators of the time cannot sufficiently express their wonder and astonishment at the monstrous contrast between the days of their forefathers and their own. "Our Temples have become Tombs. The places which were formerly adorned with the holy statues of the Gods are now covered with sacred bones (relics of the Martyrs); men who have suffered a shameful death for their crimes, whose bodies are covered with stripes, and whose heads have been embalmed, are

the object of veneration." All that was contemned is exalted; all that was formerly revered, is trodden in the dust. The last of the pagans express this enormous contrast with profound lamentation. The Roman Empire was divided between the two sons of Theodosius. The elder, Arcadius, received the Eastern Empire: – Ancient Greece, with Thrace, Asia Minor, Syria, Egypt; the younger, Honorius, the Western: – Italy, Africa, Spain, Gaul, Britain. Immediately after the death of Theodosius, confusion entered, and the Roman provinces were overwhelmed by alien peoples. Already, under the Emperor Valens, the Visigoths, pressed by the Huns, had solicited a domicile on the hither side of the Danube. This was granted them, on the condition that they should defend the border provinces of the empire. But maltreatment roused them to revolt. Valens was beaten and fell on the field. The later emperors paid court to the leader of these Goths. Alaric, the bold Gothic Chief, turned his arms against Italy. Stilicho, the general and minister of Honorius, stayed his course, A.D. 403, by the battle of Pollentia, as at a later date he also routed Radagaisus, leader of the Alans, Suevi, and others. Alaric now attacked Gaul and Spain, and on the fall of Stilicho returned to Italy. Rome was stormed and plundered by him A.D. 410. Afterwards Attila advanced on it with the terrible might of the Huns – one of those purely Oriental phenomena, which, like a mere storm-torrent, rise to a furious height and bear down everything in their course, but in a brief space are so completely spent, that nothing is seen of them but the traces they have left in the ruins which they have occasioned. Attila pressed into Gaul, where, A.D. 451, a vigorous resistance was offered him by Ætius, near Chalons on the Marne. Victory remained doubtful. Attila subsequently marched upon Italy and died in the year 453. Soon afterwards however Rome was taken and plundered by the Vandals under Genseric. Finally, the dignity of the Western Emperors became a farce, and their empty title was abolished by Odoacer, King of the Heruli.

The Eastern Empire long survived, and in the West a new Christian population was formed from the invading barbarian hordes. Christianity had at first kept aloof from the state, and the development which it experienced related to doctrine, internal organization, discipline, etc. But now it had become dominant: it was now a political power, a political motive. We now see Christianity under two forms: on the one side barbarian nations whose culture was yet to begin, who have to acquire the very rudiments of science, law, and polity; on other side civilized peoples in possession of Greek science and a highly refined Oriental culture. Municipal legislation among them was complete – having reached the highest perfection through the labors of the great Roman jurisconsults; so that the *corpus juris* compiled at the instance of the Emperor Justinian, still excites the admiration of the world. Here the Christian religion is placed in the midst of a developed civilization, which did not proceed from it. There, on the contrary, the process of culture has its very first step still to take, and that within the sphere of Christianity. These two empires, therefore, present a most remarkable contrast, in which we have before our eyes a grand example of the necessity of a people's having its culture *developed* in the spirit of the Christian religion. The history of the highly civilized Eastern Empire – where as we might suppose, the Spirit of Christianity could be taken up in its truth and purity – exhibits to us a millennial series of uninterrupted crimes, weaknesses, basenesses and want of principle; a most repulsive and consequently a most uninteresting picture. It is evident here, how Christianity may be abstract, and how as such it is powerless, on account of its very purity and intrinsic spirituality. It may even be entirely separated from the World, as *e.g.* in Monasticism – which originated in Egypt. It is a common notion and saying, in reference to the power of Religion, abstractly considered, over the hearts of men, that if Christian love were universal, private and political life would both be perfect, and the state of mankind

would be thoroughly righteous and moral. Such representations may be a pious *wish,* but do not possess truth; for religion is something internal, having to do with conscience alone. To it all the passions and desires are opposed, and in order that heart, will, intelligence may become true, they must be *thoroughly educated;* Right must become Custom – Habit; practical activity must be elevated to rational action; the State must have a rational organ-ization, and then at length does the will of individuals become a truly righteous one. Light shining in darkness may perhaps give color, but not a picture animated by Spirit. The Byzantine Empire is a grand example of how the Christian religion may maintain an abstract character among a cultivated people, if the whole organization of the State and of the Laws is not reconstructed in harmony with its principle. At Byzantium Christianity had fallen into the hands of the dregs of the population – the lawless mob. Popular license on the one side and courtly baseness on the other side, take refuge under the sanction of religion, and degrade the latter to a disgusting object. In regard to religion, two interests obtained prominence: first, the settlement of doctrine; and secondly, the appointment to ecclesiastical offices. The settlement of doctrine pertained to the Councils and Church authorities; but the principle of Christianity is Freedom – subjective insight. These matters therefore, were special subjects of contention for the populace; violent civil wars arose, and everywhere might be witnessed scenes of murder, conflagration and pillage, perpetrated in the cause of Christian dogmas. A famous schism *e.g.* occurred in reference to the dogma of the Trisagion. The words read: “Holy, Holy, Holy, is the Lord God of Zebaoth.” To this, one party, in honor of Christ, added – “who was crucified for us.” Another party rejected the addition, and sanguinary struggles ensued. In the contest on the question whether Christ were omoousios or omoiousios – that is of *the same* or of *similar* nature with God – the one letter i cost many thousands their lives. Especially notorious are the
